PAROXYSMAL ABDOMINAL PAIN

A FORM OF EPILEPSY IN CHILDREN

Paul F A Hoefer, M D , Sidney M Cohen, M D ,
and
David McL Greeley, M D , New York

Very little is known in man about the cerebral representation of the vasomotor and visceromotor mechanisms and their sensory counterparts However, animal experimentation points to the existence of neuronal chains concerned with these functions at almost all levels of the brain, and clinical evidence exists as to their involvement in disease and dysfunction of the brain

Dysfunction of cortical and subcortical structures in man in many instances leads to changes in the electroencephalogram In many cases diencephalic and particularly thalamic disorders have been known to influence the cortical electrical activity This is particularly true for epileptic manifestations in the widest sense

The present study deals with a group of patients in whom paroxysmal visceral symptoms were the presenting complaint The first 12 of these patients were seen about 10 years ago at the Babies Hospital and the pediatric service of the Vanderbilt Clinic[1] During the intervening 10 years we have added 19 cases to the group, and gradually the clinical picture has become clearer

All the children have said they had abdominal pain that in almost all instances has been periumbilical and epigastric In some instances it radiated to the lower quadrants or the flanks It has practically always been sudden in onset, of a severe nature, and has been described as colicky or knifelike The pain lasted a few minutes to several hours In several cases bouts of pain recurred several times in the course of two or three days The pain has been associated in most instances with other gastrointestinal symptoms, such as anorexia, nausea, vomiting, diarrhea, or, less frequently, constipation Sixteen of our patients fell asleep after an attack of abdominal pain no matter what time it occurred and slept for several hours even in the middle of the day Twelve patients said they experienced headache, lateralized in two cases, associated with an attack Nine patients had fever with the attacks, and seven had drooling and sweating

In addition to the attacks of abdominal pain, many of the children have shown abnormal traits In 17 there was an abnormal degree of irritability and other behavior disorders In 12 there were multiple vasomotor disturbances, such as blanching, flushing, and lability of blood pressure In two of the children peripheral vasoconstriction and cyanosis have been observed between attacks In four patients some of the attacks have been associated with cyclic vomiting, and the children were admitted in severe states of dehydration and acidosis

The clinical symptoms were not explained by the usual diagnostic procedures, the results of which were negative or showed insignificant changes On the other hand, the paroxysmal nature of the attacks, the post-paroxysmal sleep, and the fact that they occurred in groups suggested a similarity in pattern with epilepsy and, considering the possibility of a cerebral origin for the syndrome, a systematic study of electroencephalographic changes was made As a result of these studies it was found that all the patients but one showed grossly abnormal cerebral electrical activity

CLINICAL DATA

Thirty-one patients were seen in this series There was no sex preponderance, there being 16 boys and 15 girls in the group Twenty-six of the children were normal, spontaneous, full-term deliveries One had been born prematurely, weighing 4 lb (1,814 gm) at birth One was overterm, and delivery necessitated the use of high forceps, which resulted in a permanent left temporal scar In one case internal version with forceps was needed In two other instances prolonged labor was terminated by forceps delivery Early development was reported as delayed in four children The onset of the attacks could usually be traced to early infancy In a few they began after the age of 6 yr and in one after 11 yr The patients had the usual childhood diseases without complications except for one case of unspecified encephalitis and two

cases of pertussis encephalitis In two instances the onset of the syndrome occurred just after the illness In one patient attacks of abdominal pain started 2½ years after an attack of pertussis encephalitis However, this patient had had a series of convulsive attacks at the time of the encephalitis Convulsive phenomena preceding or accompanying the onset of abdominal pain were also seen in three other children One of these had a single unexplained convulsion a year prior to the onset of abdominal pain A third patient had psychomotor attacks for about eight years preceding her first attack of abdominal pain The onset of grand mal, petit mal, and psychomotor equivalents coincided with the onset of abdominal pain in still another child No other significant features were established in our patients' past histories In the family histories of the children epilepsy occurred three times, behavior problems, three times, and migraine and abdominal pain, each twice Two of our patients were sisters

Except for the multiple signs of autonomic imbalance, physical examination revealed few abnormalities Members of the group as a whole appeared underdeveloped, immature, and small for their chronological age However, no clearcut abnormalities were found except for a facial tic in one patient and shortening of the left upper extremity—associated with a Davidoff-Dyke-Masson deformity of the skull—in another The mental examination deserves to be mentioned only in two respects First, intelligence quotients were found to be scattered over a wide range from 70 to 160 (Wechsler-Bellevue test), second, there was a high incidence of abnormal irritability and behavior disorders that has already been mentioned No overt psychotic manifestations were found in any member of the group

Of the diagnostic procedures performed in this group, routine laboratory studies of blood, urine, stool, and, in a few cases, of the spinal fluid were negative Tuberculin tests were done in 26 patients and were found positive in two X-rays of the skull were obtained in eight patients, in four of these in conjunction with air studies In one of these an enlargement of the left lateral ventricle was found, in another the findings were those of the Davidoff-Dyke-Masson syndrome Pyelograms in 24 patients and gastrointestinal series in 20 failed to show any significant structural changes However, transient abnormally fast peristalsis and pylorospasm were each seen three times In one patient the two occurred together

Electroencephalographic studies showed definite abnormalities in 30 patients and a "borderline normal" record in one A breakdown according to frequency and pattern of the electroencephalograph observations revealed that of the 30 patients with abnormal activity the records were basically normal in two, while 28 had basically slow activity ranging from 2 to 7 cps; in addition, 16 of these had rapid or spike activity or both (15 to 30 cps), and four had frank spike-and-wave bursts In response to hyperventilation all but one, who was unable to cooperate had further slowing and increase in amplitude of the slow activity, usually with the appearance of synchronous bursts The same type of response to hyperventilation was found in the two patients with basically normal electroencephalograph activity No clearcut focal signs were found in any of our records It should be noted that none of these patients had electroencephalographic studies performed during an actual attack of abdominal pain

Synchronous discharges of high voltage slow waves and spike-and-wave bursts are the two main criteria for epileptic activity An over-all incidence of abnormal electroencephalographic activity, both specific and nonspecific, of almost 97%, as found in our patients, must be considered positive evidence of the cerebral and presumably paroxysmal origin of this particular disease entity This figure compares well with those obtained in highly selected groups of established epileptics in our own and other laboratories [2] The observations in normal and nonepileptic children of the same age groups similarly tested differ significantly from those presented here

In a recent case, not included in this series, the clinical and laboratory picture presented physiological evidence of a specific cerebral mechanism by which transient paroxysmal abdominal pain can be produced A girl of 15 said she had headache and severe migratory abdominal pain On repeated neurological examination nystagmus associated with inability to perform upward gaze was noted on one occasion The electroencephalogram showed synchronous bifrontal discharges of high voltage, 3 per sec activity (Fig 1) During one of her attacks of pain a gastrointestinal series was performed On this occasion a transient episode of intussusception of the terminal ileum was observed One loop of ileum in the right abdomen showed a localized narrowing in which two longitudinal mucosal folds could be recognized These folds could be identified as extending into a slightly dilated adjacent portion of the ileum, where the transversely arranged mucosal folds surrounded the thinned longitudinal folds This appearance is characteristic of an ileo-ileal intussusception (Fig 2) This and two similar areas were observed in the same examination But there was no evidence of intussusception on an examination repeated eight days later, at which time the patient was asymptomatic [3]

COURSE

Twenty-one patients were followed for periods up to 10 years Among these were eight of the original group of 12 patients Two others of this group died, one in an accident, the other one of mesantoin® (3-methyl-5,5-phenyl-ethyl hydantoin) intoxication during a period of intractable grand mal epilepsy

In nine of the 21 children attacks of abdominal pain subsided completely at adolescence In five others distinct improvement was found in that the attacks have recurred much less often and have been much milder In five others the condition has become worse

Frank epileptic manifestations occurred in nine of the entire group of 31 patients Four, as stated previously, had attacks preceding the onset of paroxysmal abdominal pain All four still have epileptic seizures, three with abdominal pain as aura, while the last one of this group no longer has attacks of abdominal pain in any form Five other patients began experiencing epileptic seizures several years after the onset of the abdominal pain syndrome To this group belongs a patient who died of mesantoin® intoxication Another patient had petit mal attacks that have since subsided The remaining three still have seizures but no abdominal pain

[2] Hoefer P F A Hoff H H, and Pluvinage R I L Effect of Anticonvulsant Therapy on Electroencephalogram of Patients with Idiopathic Epilepsy T Am Neurol A 72 185 1947

[3] Courtesy of Dr Lois Collins of the Department of Radiology College of Physicians and Surgeons

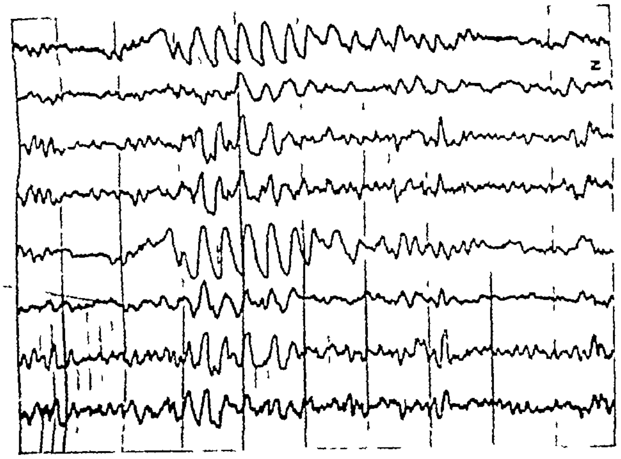

Fig 1.—G H 14 years of age Especially during hyperventilation the record shows high voltage 3 per sec activity with bifrontal preponderance often in synchronous bursts The tracings are from the right frontal right temporal right parietal right occipital left frontal left temporal left parietal and left occipital areas

Electroencephalographic records were obtained at intervals in 20 patients of the group that was followed up to 10 years The electroencephalograms of eight patients were normal, three were mildly abnormal, and nine persistently abnormal In six of the persistently abnormal records 3 cps activity was seen in response to hyperventilation, and one showed spike-and-wave groups These follow-up studies could be fairly well correlated with the clinical course, in that normal or near-normal records were obtained in patients in whom the symptoms had subsided

Anticonvulsant therapy was tried in eight of the patients who had abdominal pain not associated with clearcut epileptic attacks However, in no patient in our group was therapy administered for a sufficiently long period to allow proper evaluation In a few instances an impression of temporary improvement has been recorded

REPORT OF CASES

Case 1 —B M, a 6 year-old girl, was first seen at the Vanderbilt Clinic on Oct 23, 1945 During the previous two years she had had between 15 and 20 episodes of abdominal pain associated with nausea, vomiting, and malaise. The attacks recurred every five months, lasting five minutes to several hours, and 12 or more occurred during a period of two or three days A typical episode resembling status was described in May, 1946, as follows

The patient, who had been perfectly well before going to bed, was awakened by an attack of abdominal pain at 1 a m She had seemed to have been having a nightmare prior to this She then cried out and said she had frontal headache Almost immediately, sharp, cramping periumbilical abdominal pain followed, with the patient doubled up and screaming The pain lasted about five minutes, during which time she vomited her evening meal After five minutes relief she had another attack, this time lasting five minutes She then fell asleep but was again awakened at 4 a m with another series of three or four paroxysms of pain and vomiting The patient appeared to be stuporous and fell asleep until 6 a m., when the attacks recurred

Six weeks prior to this episode the patient was seen to snap back" and become "stiff" during a vomiting spell She became deeply stuporous for 10 min and could not be awakened She then went into a deep, heavy sleep from which she could be aroused only with difficulty

Past history revealed an attack of pertussis at the age of 4 years immediately preceding the onset of her attacks of abdominal pain

Her family history was noncontributory, except that a baby sister of 13 mo had breathholding" spells

Examination The patient was thin, normally developed, retiring, and fearful She had considerable abdominal spasm and pain The general physical and neurological findings were otherwise normal Urinalysis showed the presence of acetone (3 +) The electroencephalogram record revealed numerous high voltage synchronous spike and-wave bursts preceded by brief showers of spikes (Fig 3*A*) There were no other positive laboratory observations

Course The patient s acute symptoms subsided spontaneously, and her urine became acetone-free on supportive therapy Subsequently, her attacks began to come at shorter intervals There was no clearcut relief on various anticonvulsant drugs [phenobarbital, diphenylhydantoin (dilantin®), trimethadione (tridione®), mesantoin,® and mephobarbital (mebaral®)], though at one time she was reported to be free of symptoms for a period of nine months Recently two additional symptoms have developed "tremor of the hands' and a variety of psychomotor episodes, including fully creditable fugue states, forgetfulness, and the like In addition, she showed various behavior disorders, moodiness, scratching or biting other children Her last electroencephalogram, taken in February, 1950, when she was 10½ years old, was only mildly abnormal and without convulsive patterns (Fig 3*B*)

Case 2 —T L, a boy 8 years old, entered the Babies Hospital on July 8, 1940 He said he had had frequent episodes of abdominal pain for one year Onset occurred during convalescence from pneumonia, after which attacks recurred repeatedly from one to five times a week He had an aura of a "noise in the head" or transient headache This was followed by rather severe periumbilical pain lasting a few seconds and associated with rigidity of the hands and momentary loss of consciousness The patient then fell asleep for about 10 min and on awakening was clear mentally but had a rather "glassy stare" in his eyes

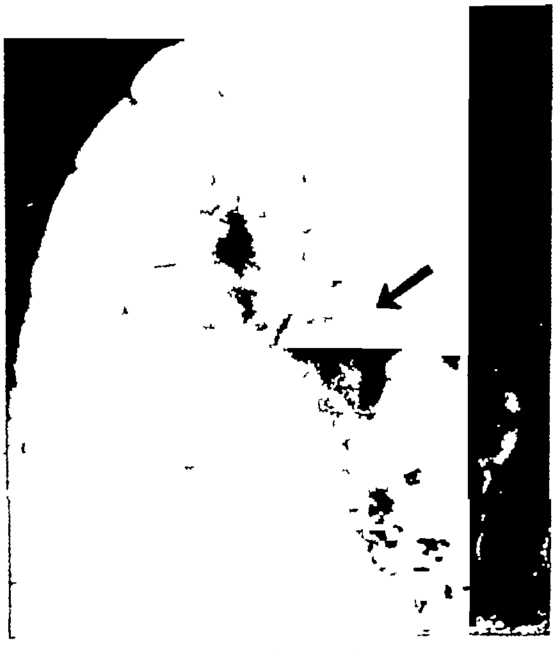

Fig 2.—Ileo-ileal intussusception indicated by arrow See x ray report in the text.

Examination The patient was well nourished and well developed, overactive, and combative The general physical and neurological findings were normal Tuberculin [illegible] 1 mg) was positive A chest x ray was reported as negative Gastrointestinal series revealed no evidence of organic disease of the gastro intestinal tract, but there was some decrease in tone of the lower small intestine, a low cecum, and hypomotility of the ileum

The electroencephalogram showed medium to high voltage, rapid activity in both frontal areas and somewhat less in the parietal areas Irregular medium 4 to 5 per sec activity was seen mostly in the occipital areas Occasional synchronous bursts of high voltage 3 to 4 per second activity appeared, especially with hyperventilation (Fig 4*A*)

Course Abortive grand mal (slight convulsive movements of both arms and right leg with loss of consciousness) later developed in the patient Abdominal complaints decreased in frequency and intensity, and the patient had only five mild attacks in one year, although he had stopped taking anticonvulsant medication After diphenylhydantoin was reinstituted, the patient was symptom-free for several months, and attacks usually occurred when medication was omitted

An electroencephalogram taken at this time, March, 1945, showed considerable improvement It was still abnormal but revealed no paroxysmal patterns The record was diffusely irregular, with a small amount of rapid activity limited to the frontal leads and a large amount of slow 4 to 6 per sec disorganized activity, both mostly of low amplitude There was not much change with hyperventilation (Fig 4*B*) No subsequent electroencephalographic studies were done

Frank grand mal uncontrolled by anticonvulsant therapy then developed in the patient He was again hospitalized because mesantoin® sensitivity and aplastic anemia with septicemia developed He continued a downhill course and died in February, 1948

The autopsy, including gross and microscopic examination of the brain, showed evidence of acute toxic-infectious disease There were diffuse cortical changes consistent with severe grand mal attacks and no signs of any focal lesion

Case 3 —W S , a 12-year-old boy, was seen at the Vanderbilt Clinic in January, 1940 At the age of 7 years he began to have attacks of headache, buzzing in the ears, nausea, and vomiting with abdominal pain every two to four weeks Each episode lasted 30 min and was followed by sleep for four or five hours He was perfectly well on the next day Past history was noncontributory except for food allergy (hives) and one episode of sleepwalking

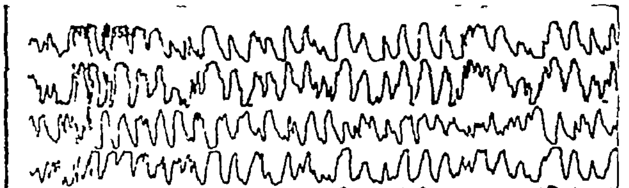

Fig. 3 —*A* B M 6½ years of age Synchronous burst of high voltage somewhat atypical 3 per sec spike and wave activity preceded by a brief shower of spikes The end of the run shows mostly wave activity Time for 1 sec and calibration for 50 µv are indicated *B* B M 10½ years of age Th [illegible] ly irregular with some slow activity in both frontal [illegible] trips the tracings are from the right frontal right pari [illegible] left frontal left parietal and left occipital areas)

Examination —The general physical and neurological findings were normal Electroencephalographic studies revealed a striking response to hyperventilation with almost immediate slowing to synchronous, high voltage 3 per sec waves from a reasonably normal background [illegible] several occasions synchronous bursts of 2 to 3 per sec activity were seen This response came on within seconds (Fig 5)

Course On diphenylhydantoin the patient had no attacks for almost three months The drug was then discontinued for a similar period, and during this time he had six attacks Diphenylhydantoin therapy was resumed, and again he was free of symptoms while he was receiving this medication Subsequently, the attacks subsided spontaneously, and he was discharged without any further therapy The patient did well in his studies, having won a four-year scholarship at high school On July 10, 1942, while delivering newspapers on a bicycle, he was hit by an automobile and killed

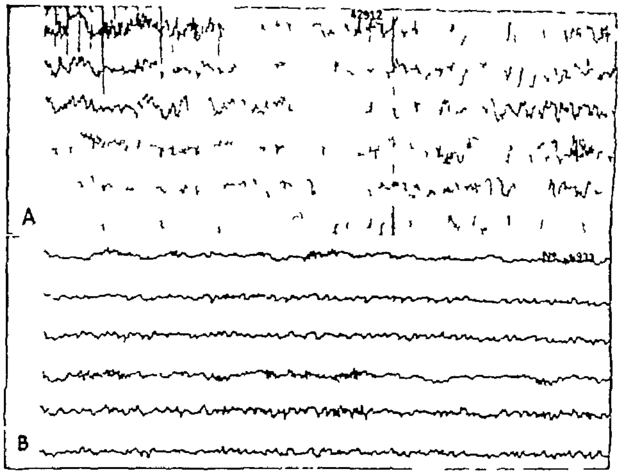

Fig. 4 —*A* T L. 8 years old The record shows two striking abnormalities Mostly medium voltage 25 per sec activity is seen in both frontal areas while irregular mostly medium voltage 4 to 5 per sec activity occurs in the other leads On one occasion a synchronous burst of slow activity is recorded in all the leads *B* T L 13 years of age The record is irregular with some persisting rapid activity in the two frontal areas and low voltage disorganized slow activity in the other leads. The time and calibration and sequence of tracings is as in figure 3

Case 4 —C McC , 7-year-old boy, was first seen at the Vanderbilt Clinic in January, 1936 He had a history, starting at the age of 2½ years, of severe frontal headaches frequently lateralized over the right eye and always associated with nausea, vomiting, and abdominal pain The attacks, which recurred every two months, were followed by sleep for a few hours, and when he woke the patient vomited with relief of the headache At 11 years he had three episodes of nausea and fainting while in church In addition, he was very restless during sleep, "talking and raving" and sleepwalking In March, 1939, he was treated for a fractured elbow incurred in a fall during a somnambulistic episode Past history suggested allergic rhinitis for one year when he was 10 years old Family history was significant only in that his mother had hay fever

Examination The patient was thin, well developed, irritable, and restless but cooperative The general physical and neurological observations were normal Electroencephalogram showed in the first part of the record quite irregular activity, with a good deal of poorly formed 5 to 7 per sec activity of medium voltage, and low voltage 15 to 20 per sec activity Occasional synchronous bursts of slow activity were seen There was a striking response to hyperventilation with bursts and long runs of very high voltage 2 to 3 per sec waves The patient s symptoms gradually subsided, except for occasional mild frontal headaches and persistent irritability When last seen in February 1950, he was a tall, asthenic 21 year-old man with a responsible job He had completed one year of college An encephalogram taken at this time revealed mild irregularities especially with hyperventilation, but the record was otherwise normal

Case 5 —E T , a girl of 8 years, was seen at the Babies Hospital in November, 1940 Since the age of 1½ years and after a fall she had experienced severe generalized periumbilical, and epigastric pains The attacks varied in frequency between once a week and once a month were followed by pallor, yawning, and malaise, and were associated with nausea, vomiting, constipation, and temperature to 104 F The abdominal pain was cramplike at the onset of an episode, then increased until it felt "like knives sticking", and her abdomen became rigid and extremely tender The pain gradually subsided, only to recur repeatedly The whole episode usually lasted a day, and during this time the patient felt drowsy and occasionally went into a deep slumber On the day prior to an attack the patient s face was flushed

Past history revealed allergy to various foods, including chocolate, but dietary restrictions and 'injections" did not relieve her symptoms An appendectomy was performed when she was 3½ years old

Examination The patient was a small, thin girl who was well oriented and cooperative The pulse was 104 the blood pressure was 118/72 A soft systolic murmur was heard at the apex Gastrointestinal series showed reflex pylorospasm When repeated at a later date it was reported to be negative The electroencephalogram record was mildly abnormal Single, large, slow waves of frequencies between 3 and 4 per sec were seen in both occipital leads, occasionally with a vague suggestion of a slow spike and wave pattern In the two frontal leads short bursts of fast activity were noted With hyperventilation a moderate increase in incidence of the slow waves was noted, and on one occasion a short burst of moderately high synchronous slow waves was seen

Course The patient's symptoms have continued without significant improvement, although the abdominal pains are said to be less severe A trial of antihistaminics brought no relief Her subsequent electroencephalograph records, however, have all been essentially normal with no response to hyperventilation Although 18 years old, the patient is a small, underdeveloped girl who looks like one of 14

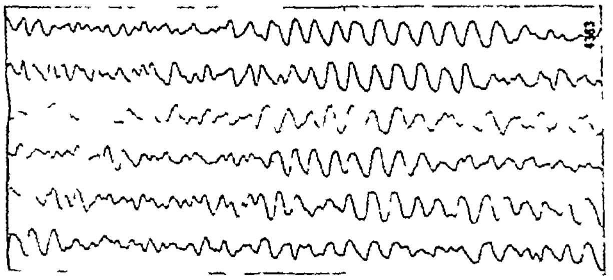

Fig 5—W S 12 years old During hyperventilation the record shows high voltage 3 per sec activity Tracings are from the right frontal right parietal right occipital and the left frontal left parietal and left occipital areas

Case 6—A H B, a 12-year-old girl, was first seen at the Vanderbilt Clinic in November, 1941 At 2½ years she began to have occasional episodes of falling to the floor with rolling of the eyes These were followed by spells consisting of change of expression and pallor of the face, the patient lying down quietly and becoming limp These attacks occurred during the next nine years every 12 to 15 mo and were preceded by an aura of dizziness and 'blackout ' Since December, 1940, the episodes have increased in frequency to three times a month, starting with severe periumbilical, cramplike abdominal pains associated with anorexia and followed by sleep for two hours

Past history was significant in that the patient was premature, weighing 4 lb (1,814 gm) at birth She had had infantile diarrhea and marasmus Development was delayed, the patient did not talk until she was 3 years old, and enuresis persisted until that time She was allergic to chocolate Family history, extending back to both maternal and paternal grandparents, revealed epilepsy, prostitution, indigence, feeblemindedness, shiftlessness, and capital crime All the patient s ten siblings were feebleminded or of borderline intelligence

Examination The general physical and neurological findings were normal The electroencephalograph record showed fair alpha activity on the right, poor on the left side A good many slow waves (3 to 5 per sec) of moderately high voltage were seen in both occipital leads but definitely more on the left side With hyperventilation a distinct increase in amplitude occurred with a definite additional slowing Synchronous bursts of very high voltage irregular 3 to 5 per sec waves were seen repeatedly, lasting for more than six seconds In addition, runs of the same type of waves occurred in either occipital lead alone but again definitely more on the left side

Course The patient's attacks subsided on diphenylhydantoin When medication was discontinued in June, 1942, she remained free of attacks until November, 1946 At that time the attacks recurred, and she was again placed on diphenylhydantoin, 0 1 gm twice a day Episodes were reduced in number to about two a year In the summer of 1949 she had a grand mal seizure preceded by an aura of abdominal pain The patient is now a 21-year-old housewife, who is short and obese, and shows much irritability and vasomotor lability Her most recent electroencephalogram record is somewhat disorganized without being clearly abnormal There is a persistent difference between right-sided and left sided alpha activity A few runs of disorganized 5 per sec activity are seen, especially on the left side, at the end of and after hyperventilation

COMMENT

Fulton, Kennard and Watts[4] found that stimulation of the rostral portion of the premotor area causes increase in peristalsis Extirpation of the same region leads to slowing of visceral motility and in some instances intussusception, as shown by Watts and Fulton[5] Mettler and associates[6] made similar observations and found ulcers of the stomach at autopsy in animals with long-standing ablation of the frontal lobes More recently, Spiegel and associates[7] found that gastrointestinal motility in dogs could be influenced from areas 5 and 3 in addition to the premotor area 6 and occasionally area 4 but in their experience from no other point of the cortex Correll, Greenberg and Pool[8] produced massive intussusception as the result of repeated bilateral stimulation of the cingular gyrus just above the splenium of the corpus callosum in one unanesthetized cat The same animal had generalized convulsions in response to the stimulation on this occasion

While the experimental observations were concerned with the results of cortical stimulation and ablation, Cushing[9] and Grant[10] reported gastric and duodenal ulcers in patients with tumors of the interbrain

In the realm of epileptic phenomena, epigastric pain as an aura preceding grand mal attacks was described by Gowers,[11] who in his book "The Borderland of Epilepsy" differentiated it from vagal and vasovagal attacks, epigastric sensations of oppression or fullness Oppenheim[12] in discussing earlier authors' concepts of "larval" epilepsy including "gastric disturbances" thought the evidence was "most uncertain " Patrick and Levy[13] described paroxysmal abdominal pain, mostly in infancy and childhood, as a "fore-runner" of true grand mal seizures in 13 out of 500 cases, in six of which it became the aura Watts and Frazier[14] described the cases of two patients, one a boy of 8 years, in whom nausea, epigastric distress, and vomiting were often substituted for true convulsive seizures Wechsler[15] recognized abdominal pain separate from nausea and projectile vomiting as a symptom of brain tumor in a small series of verified cases Penfield[16] described epigastric pain as an unspecific aura associated with many different types of seizures, such as autonomic, petit mal, Jacksonian, and hallucinatory In some of these the localization of the subsequent seizures was presumably diencephalic, in others cortical temporal, central, or parietal According to Penfield, epigastric aura has no localizing value

Robinson[17] studied 100 epileptic patients by gastrointestinal x-ray series Twenty-three of these patients had some type of gastrointestinal aura However, only three had gastrointestinal abnormalities Eleven others showed structural or functional abnormalities of the gastrointestinal tract but had no gastrointestinal aura

Moore in several recent publications[18] has described several cases of patients with symptomatic or in one case idiopathic attacks of abdominal pain of cerebral origin, some with electroencephalograph findings suggestive of paroxysmal disorder None of his patients were infants or children

Delay[19] has recently described a patient 19 years of age, a congenital syphilitic in whom abdominal pain in attacks, vasomotor changes and an abnormal electroencephalogram with suggestive left temporal focus developed This patient had striking relief from his attacks on anticonvulsant medication

Lambert[20] in a study of 25 children with abdominal pain stresses psychodynamic mechanisms in preference to an organic epileptic etiology in spite of the fact that 12 of his patients had abnormal electroencephalograms, three of these with frank convulsions Furthermore, two of the children had evidence of "spastic colon" by x-ray studies and one had Sydenham's chorea

Our reasons for including the syndrome described in this study among the manifestations of epilepsy in the widest sense may well be reviewed at this point The attacks of abdominal pain are episodic in nature and often grouped in a status pattern In many instances the attacks are followed by episodes of sleep of several hours' duration, often in the middle of the day Several of our patients had brief periods of unconsciousness or other seizure fragments associated with the attacks of pain Abnormal electroencephalographic patterns were found in 97% of our patients in "interseizure" records Finally, nine of our patients had frank convulsive seizures

Response to anticonvulsant therapy in patients without frank convulsive manifestations has been equivocal in our experience However, Schwentker and Livingston[21] recently described a group of 29 children with abdominal pain as a manifestation of epilepsy Fourteen of the patients had postictal sleep, 11 of these were markedly benefited by treatment with diphenylhydantoin None of the others were helped by anticonvulsant medication

SUMMARY

This report is a follow-up study of a group of children suffering from abdominal pain of cerebral origin and considered to be an epileptic phenomenon

A total of 31 patients were observed The clinical picture includes numerous autonomic features, especially vasomotor phenomena

1 Pathological electroencephalographic findings were obtained in 30 cases

2 Postictal sleep was seen in 16 cases

3 Nine patients had clearcut convulsive phenomena at one time or another

4 In nine other patients without convulsions the attacks subsided spontaneously at adolescence

5 The physiological and clinical background of cerebral control of gastrointestinal motility and sensibility is discussed

6 One patient had intestinal intussusception at the time of her attacks of pain This should be considered as one of the underlying mechanisms for abdominal pain in view of known cerebral mechanisms for the production of intussusception

622 W 168th St

William Beaumont.—The fame of William Beaumont is well established in American scientific lore, the school boy whose participation in the science of physiology is, at best, in the hazy future has heard in some detail of this energetic doctor who carried out experiments on a man with a hole in his stomach in a backwoods settlement in upper Michigan more than a hundred years ago Beaumont s ancestors were stalwart New Englanders He grew up in a home where civic and religious obligations were taken seriously and in addition he had the advantages of excellent local schooling He settled in Champlain, New York, where for three years he taught the village school He entered into the social life of the town and, after deciding to become a doctor, read avidly in borrowed medical books In 1810 he began the serious study of medicine with Dr Benjamin Chandler in St Albans, Vermont His first hand experience in anatomy consisted of the dissection of every amputated arm or leg he could secure, he urged autopsies at the death of his patients and from these, too, he learned anatomy He secured his license to practice medicine in 1812 and very soon thereafter joined the U S Army at Plattsburgh Beaumont took part in the War of 1812, seeing service as a military surgeon from February, 1813, to August, 1814, largely in the region around the mouth of the Niagara River and in Plattsburgh Even before leaving Plattsburgh and throughout the campaign in 1813 he kept voluminous notes bearing on his medical experiences—the therapeutic and surgical treatment employed and, wherever possible, the result, obtained, all in the minutest detail —Arthur H Smith, William Beaumont (November 21, 1785—April 25, 1853), *Journal of Nutrition* May, 1951

At Memorial Hospital we have noted in the past several years a definite and rapid increase in the incidence of cancer of the lung At the same time, a corresponding increase in the number of lesions that we classify as "terminal bronchiolar or alveolar cell cancer of the lung" has been reported by the department of pathology

Malassez,[1] in 1876 was the first to describe the multiple, nodular form of alveolar cell carcinoma At autopsy both of his patient's lungs were found to be studded with pea-sized nodules, but the bronchi themselves were free of tumor Microscopic study of the lesion revealed the alveoli to be lined with a cylindrical, cuboidal and flat epithelium The peribronchial lymph nodes contained metastatic tumors In 1903 Musser[2] described a diffuse form of this type of lung cancer This is a rarer type, which may involve a single lobe or an entire lung, and it may simulate lobar pneumonia in the stage of gray hepatization Musser also described satellite nodules in the opposite lung

CLINICAL ASPECTS

The clinical material for this report is a series of 33 histologically proved cases of terminal bronchiolar cancer of the lung found in a review of 1,585 malignant lung lesions at Memorial Hospital The first case of terminal bronchiolar cancer encountered in this series appeared in 1932 Twenty-one patients with this type of disease have been seen by us in the past five years, 18 in the past two years, and 13 in the past year This would seem to indicate that the disease is now more readily identified by the pathologist and that in many of the earlier cases lesions may have been incorrectly classified as mesothelioma, adenocarcinoma, anaplastic carcinoma or metastatic carcinoma The true incidence of this disease at our hospital, therefore, cannot be accurately determined There has been a rapid increase in cases of lung cancer at Memorial Hospital in recent years, and a proportionate increase in the number of carcinomas of the alveolar type is to be expected

The symptoms and clinical course of terminal bronchiolar carcinoma differ slightly, but definitely, from those recorded for the commonest types of bronchogenic cancer The disease varies in aggressivity death may occur within a few months after the onset of symptoms, or, as in the case of two of our patients, who are alive and well more than five years after operation, the disease may prove to be relatively localized and benign There was definite evidence of metastases in all the 19 patients who died Brain metastases were noted in two patients, and in five there was roentgenographic evidence of bone metastases In 70% of the cases of terminal bronchiolar carcinoma, the history on admission pointed to a primary lung disease Fourteen of the 33 patients complained of symptoms now recognized as suggestive or even pathognomonic of cancer of the lung The history of eight other patients simulated that of an inflammatory type of pulmonary disease, four patients complained of symptoms that indicated a generalized disease, such as Hodgkin's granuloma Five patients had no symptoms, the tumor of the lung being discovered in routine chest roentgenograms taken for tuberculosis survey studies or in routine preemployment films Carcinoma of the esophagus was suspected in one patient, and the remaining patient had symptoms of cardiac failure

In this series of 33 cases, the average age of the patients was 55 6 years and one fourth of them were women The occupations of the men varied from business administration (in 10 cases) to various types of manual labor, such as plumbing, mechanics and stationary engineering The women were all housewives No recognized carcinogenic factor was elicited in a study of the histories of these patients Five did not smoke, eight were moderate smokers and 10 were heavy smokers Family histories were available for 21 patients, and four of these reported cancer in other members of the family History of an attack of disabling influenza, 20 to 30 years before the current illness, was described by two patients Eleven gave histories of previous lung disorders One probably had had pulmonary tuberculosis 25 years before the present illness, and two reported having had pleurisy Five had been told they had pneumonia in the six-month period prior to hospitalization

Presenting Symptoms —Pain and cough were the commonest symptoms Bloody sputum was noted in nine cases, but only one frank hemoptysis was recorded The average duration of symptoms before admission was four months

Physical Findings —No objective evidence of tumor was found on physical examination of 13 of the 33 patients Physical signs indicated chest disease in 13 instances Five patients had palpable tumor metastases in the skin and supraclavicular lymph nodes, and one, although in the terminal stage of the disease, had no physical signs of cancer Pleural effusion was recorded as present in nine instances, and two patients had clinical signs of brain metastases

Roentgenologic Findings —In one instance the x-ray studies were considered to be negative, and yet in this case an exploratory thoracotomy revealed a nonresectable setting due to extensive invasion of vital structures by cancer The commonest roentgenographic finding was

a single, peripherally located, circular area of increased density, usually 2 to 4 cm in diameter This nodule, as in almost any primary lung cancer that occurs away from the hilus, seemed to differ from the usual metastatic nodule in that it appeared to be more irregular, slightly larger, less homogeneous, less sharply outlined and, in many instances, less dense Seven patients had multiple nodules, and the disease was bilateral in several instances Roentgenographically, the disease in these cases might be confused with pneumonoconiosis, miliary tuberculosis or metastatic cancer Evidence of fibrosis, however, was absent, and the nodules seemed to coalesce to form infiltrative masses It is interesting to note that terminal bronchiolar cancer of the lung does not produce a characteristically diagnostic roentgenogram A roentgenographic diagnosis of malignant lung tumor was made in only 65% of our cases

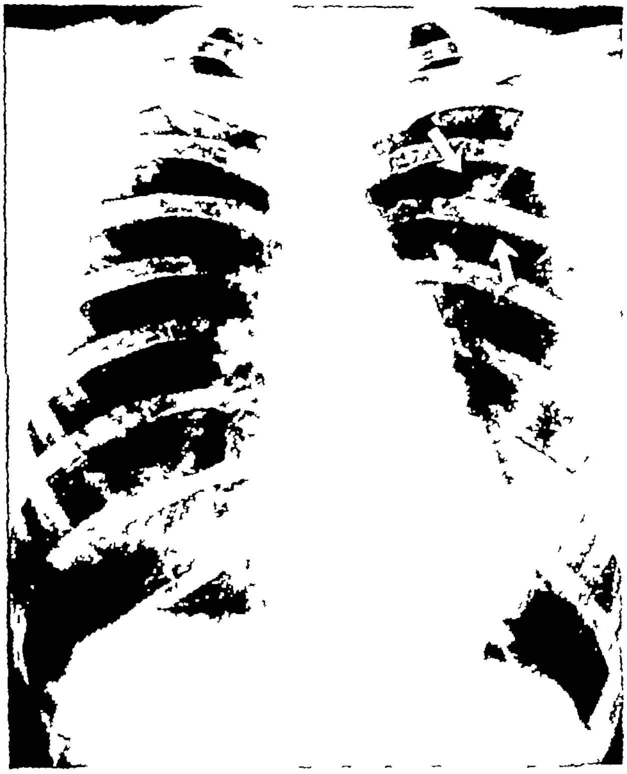

Fig 1 (case 21)—Roentgenogram showing circumscribed tumor in the left upper lobe

Laboratory Data—In no case was the sputum positive for acid-fast bacilli Cytological studies were made in 15 cases, six specimens were reported as Papanicolaou Class V (showing conclusive proof of cancer), three as Class IV (positive for cancer), and three others as Class III (strongly suggestive of cancer) In one case, in which pneumonectomy was done, the preoperative sputum [illegible]ted as Class V was the only positive evidence on [illegible] to operate was based After opera[illegible] was negative, but five months later it [illegible]rted as Class V, and roentgenograms then [illegible] presence of multiple metastases in the con[illegible]ng

Papanicolaou,[3] who made the cytological examinations of the sputum and bronchial washings, has noted that this tumor exfoliates profusely and yields abundant material characteristic of this type of neoplasm MacDonald[4] also believes the bronchial cell changes to be easily identifiable and characteristic of the disease

The peripheral blood picture in terminal bronchiolar cancer is not that seen in inflammatory disease of the lungs The leukocyte count varies between 7,000 and 10,000 The lowest was 3,400 and the highest 14,000 For patients with lung cancer the hemoglobin content was exceptionally high, averaging 13 to 15 gm, and the red cell count averaged 4,000,000

In 19 cases studied bronchoscopically, the tumor was visualized in three instances and positive histological evidence obtained Each of the patients was in an advanced, or terminal, stage of the disease, and the biopsies revealed cancer in the submucosal lymphatics Six patients in the terminal stage were too ill to tolerate bronchoscopy

BASES FOR DIAGNOSIS

The literature reveals that the diagnosis of terminal bronchiolar carcinoma is most frequently made at autopsy However, in our series of 33 cases, a clinical diagnosis of terminal bronchiolar carcinoma was made in 22 instances A combination of tests was used to establish that diagnosis cytological studies of sputum established the diagnosis in five instances, aspiration biopsies of lung masses, in five, and thoracotomy with biopsy, in eight cases A surgical biopsy of a peripheral lymph node established the diagnosis in four instances In five cases the clinical and laboratory data indicated

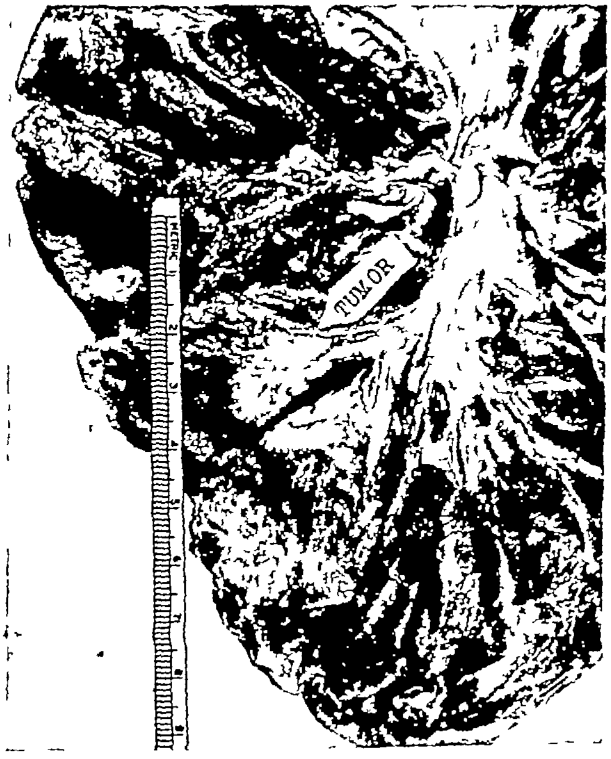

Fig 2 (case 21)—Operative specimen showing terminal bronchiolar carcinoma.

---

[3] [illegible] laou [illegible] Personal communication to the authors

[4] [illegible] and Woolner L. B Cytologic Examination of

diagnosis was made only at the time of necropsy In the remaining six cases, the diagnosis of lung cancer was established only after post-mortem examination

TREATMENT

The accepted treatment of terminal bronchiolar carcinoma, as of cancer of the lung in general, is excisional surgery Radiation therapy may prove a valuable adjunct in palliative treatment in advanced cases Because of the advanced nature of the disease only symptomatic treatment could be administered to six of the 33 patients Two patients were misdiagnosed as having metastatic thyroid cancer and received roentgen therapy with some worthwhile palliative effect The remaining 25 patients received either surgical and/or radiation therapy

Radiation Therapy —Nine patients received primary radiation therapy Four had a hilar mass, three had diffuse nodular disease throughout the lungs and two had a solitary pulmonary mass with pleural effusion containing tumor cells Six patients died four to eight weeks after completion of therapy, and no appreciable palliative effect was noted in these instances

In a recent case, surgery was combined with irradiation in a program currently being studied at this institution The patient was found at the time of thoracotomy to have a locally resectable primary lung tumor but a nonresectable mediastinal mass A segmental resection of the primary tumor was done, and 56 6 mc of radon in the form of gold seeds was placed in the mediastinal masses under direct vision This insured direct radiation into the cancer and diminished the undesirable radiation effects on the normal lung tissue The gold seeds also acted as excellent markers to direct the beam of supplementary supervoltage roentgen therapy Brain metastasis has since developed in this patient, and roentgen therapy to the brain has given relief of symptoms The patient is still alive with evidence of metastases in the brain and cervical lymph nodes

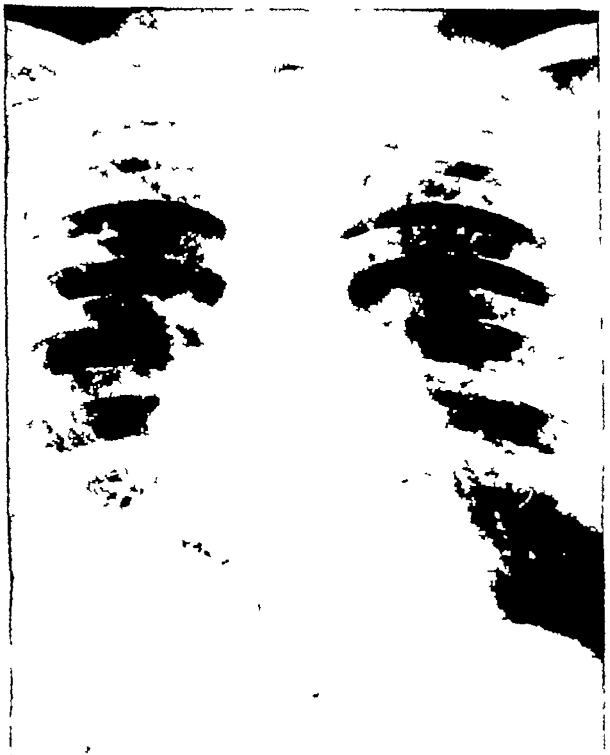

Fig 3 (case 18) —Immediately preoperative roentgenogram showing diffuse masses in the right lower lobe

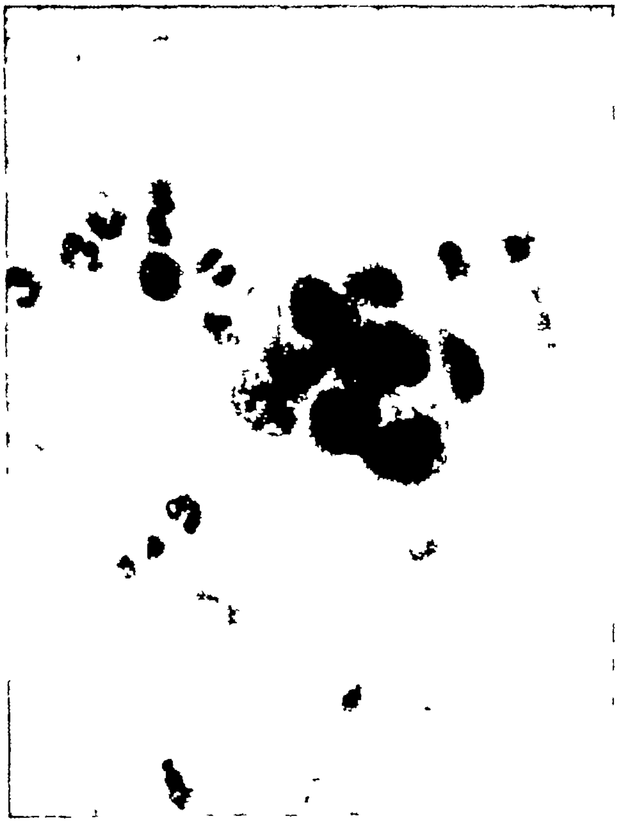

Fig. 4 —Photomicrograph of bronchial washing specimen showing characteristic neoplastic cells

We realize that nine cases constitute too small a series for determination of the efficacy of radiation treatment and also that most of the cancers so treated were inoperable by present criteria and thus clinically far advanced However, our observations indicate that radiation as a primary means of treatment has little value

Surgical Therapy —Sixteen patients received definitive surgical therapy Ten are living and two of these are alive and well more than five years after excision of their terminal bronchiolar cancer One was treated by lobectomy and the other by a simple excision of the tumor Nine of the 16 patients had a complete pneumonectomy, the first of which was done in 1942 Three of these patients died from widespread metastatic cancer 7, 9 and 19 months respectively, after their operations In four instances metastases were demonstrated in the mediastinal lymph nodes removed at the time of operation Extensive cancer metastases developed in [illegible] remaining lung of one patient Ptero[illegible] (teropterin®) and nitrogen mustard [illegible] fect in this case Five of the nine patients [illegible] monectomy was performed are living and fr[illegible]

In one case treatment consisted of a segm[illegible] tion of the primary tumor and interstitial rad[illegible] to the metastatic mediastinal nodes as previ[illegible] scribed In only two of the 1[illegible] was the tumor found to be nonresectable at the time of thoracotomy Both of these patients had direct extension of bulky tumor into the mediastinum

Sixteen cases may constitute too small a series for determination of the efficacy of a given form of treatment However, a resectability rate of 87% is more than double that encountered in the usual types of bronchogenic cancer and suggests that this form of cancer of the lung is more amenable to surgical excision It is also noted that the only patients in our series who survived five years after treatment were those treated surgically (Tables 1 and 2)

PATHOLOGY

Terminal bronchiolar carcinoma occurs almost always in the peripheral portions of the lungs, in either a nodular or a diffuse form In 21 of the 33 cases, the lesion occurred in the upper lobes, 11 in the left lung and 10 in the right lung The nodular form was present in 23 instances The nodules varied in size from a few millimeters to 8 cm They were discrete and irregular in outline and occasionally had soft necrotic centers The nodules that occurred near the periphery frequently involved the pleura The diffuse form of the disease, involving part of a lobe, the whole lobe and sometimes an entire lung, was the predominant feature in 10 cases (30%) of this series In some instances the multiple nodules seemed to coalesce and form diffuse masses, which grossly gave the appearance of lobar pneumonia in the stage of gray hepatization In no instance were cavities seen either in the involved area or in the distant lung tissue Atelectasis was not observed grossly distal to the tumor, nor was suppuration a common finding In this respect, the gross anatomy of terminal bronchiolar carcinoma differs from the usual bronchogenic carcinoma Since the primary lesion in terminal bronchiolar carcinoma starts peripherally, atelectasis and suppuration of the distal part of the lung do not occur Local compression of lung parenchyma by the tumor may produce marginal areas of atelectasis, edema and congestion

Another gross anatomic characteristic of terminal bronchiolar carcinoma is the absence of involvement of the bronchi In the early lesions, it is impossible to demonstrate a tumor arising from bronchial epithelium In the more advanced cases, a bronchus may be invaded by surrounding carcinoma and ulceration may occur Pleural effusion occurred in nine instances, and in five the effusion was bilateral

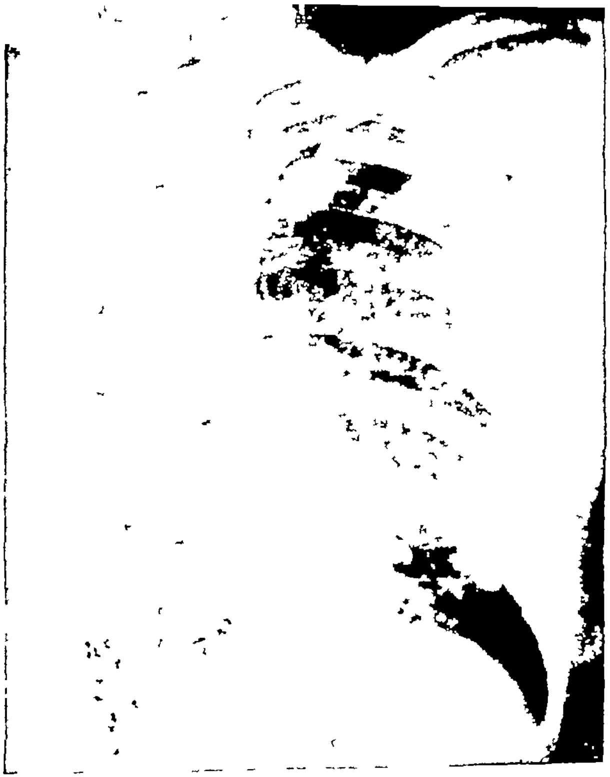

Fig. 6—Contralateral metastases six months after pneumonectomy

Metastases—Metastases were demonstrated in 25 of the 33 cases The commonest transference was to the

same lung, to the opposite lung or to peribronchial or hilar nodes In five of the nine patients who were subjected to pneumonectomy, lymph nodes removed with the lung contained metastatic carcinoma Among 10 patients in whom a solitary lung nodule was the only clinical evidence of cancer, metastases were found in regional nodes in four instances

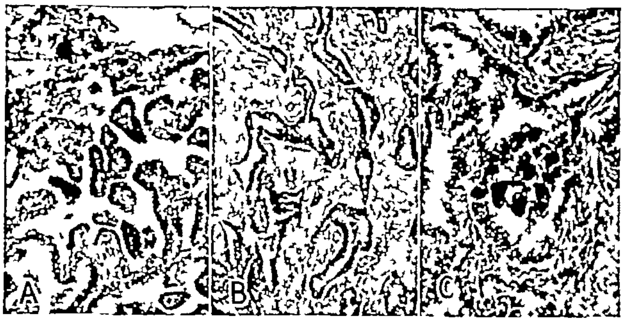

Fig 7 —*A* photomicrograph of tissue removed from patient (case 21) showing papillary formation in terminal bronchiolar carcinoma *B* an adjacent area from the specimen showing fibrosis *C* photomicrograph of an area of terminal bronchiolar carcinoma (case 21) showing desquamated débris in the lumen

Microscopic Appearance —The microscopic anatomy of terminal bronchiolar carcinoma shows the distinguishing characteristics of the disease, which are unlike those seen in the commoner type of bronchogenic carcinoma The alveolar spaces are lined by cuboidal or columnar nonciliated epithelium in several layers or in papillary formation The alveoli may be distended and completely filled with proliferating epithelium Single cells or clusters containing large multinucleated giant cells may be found lying free in the alveolar spaces These are the same type of cells that Papanicolaou describes as characteristic of *terminal bronchiolar carcinoma as evidenced in cytological* studies of the sputum The individual cells have varying degrees of pleomorphism The nuclei are hypochromatic, rounded, vesicular or irregular in outline Mitosis is not common Among our cases the cytoplasm was acidophilic and relatively abundant Signet-ring cells, so characteristic of adenocarcinomas of gastrointestinal origin, were found in one-half the cases The vacuoles of the signet-ring cells contained mucin and were indistinguishable microscopically from those seen elsewhere in carcinomas arising in mucus-producing glands

COMMENT

The microscopic appearance of terminal bronchiolar carcinoma, together with the failure to demonstrate origin from the primary or secondary bronchi, supports the view that this type of cancer arises from the lining cells of the terminal bronchioles or alveoli The nature of the lining epithelium of the alveoli is still a controversial subject, as evidenced by the discussions in recent papers[5] Current opinion appears to favor Miller's[5] thesis of a continuous lining epithelium of the alveoli Observations on the type of changes seen in the alveolar lining in bronchiectasis and other chronic pulmonary infections support this view Herbut,[6] Ikeda,[7] and Bonne[8] believe that terminal bronchiolar carcinoma originates in the basal cells of the bronchioles, which proliferate and extend peripherally along the septa Others[9] contend that the alveolar lining cells are mesenchymal in origin, however, sufficiently definite evidence in favor of this hypothesis appears to be lacking From a practical standpoint, this problem is chiefly of academic interest, for these neoplasms are clinically and anatomically similar to other carcinomas of epithelial origin

Anatomically, there is a close resemblance between terminal bronchiolar carcinoma and pulmonary adenomatosis The latter is characterized by a tall columnar epithelium, paucity of mitotic figures, and absence of stromal invasion. Ewing[10] discusses pulmonary adenomatosis as an entity However, a search of the files in the laboratories of Memorial Hospital fails to yield a single case of true, obviously "benign," pulmonary adenomatosis

In laboratory animals, the carcinogenic effect of urethan, dibenzanthracene, and other carcinogens is well known These carcinogens, whether given intraperitoneally, intratracheally or subcutaneously, caused the development of multiple lung tumors in 100% of susceptible mice within four months[11] Many authors report the same histological picture in both the spontaneous and the induced tumors They describe the tumor as an adenomatous tumor of alveolar cell origin, invading the lung and metastasizing to the surrounding lymph nodes These tumors have histological characteristics similar to those of the neoplasm described in this article

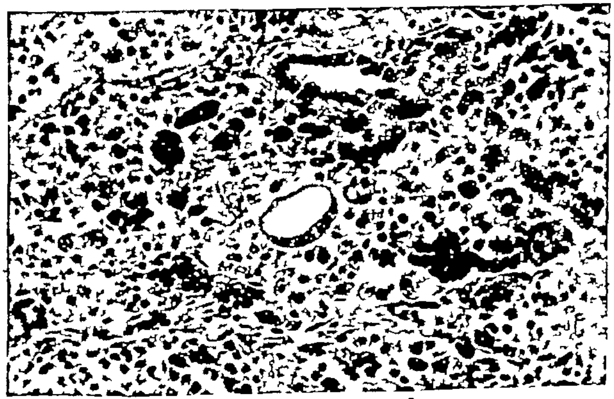

Fig 8 (case 18)—Photomicrograph of tissue removed from the right lung of patient, showing characteristic signet ring cells

An infectious disease of similar histological appearance, occurring in sheep and in other animals, is known as jaagsiekte (driving sickness) but is also known by various other names, such as epizootic adenomatosis, and infectious adenomatosis It has been reported as closely resembling terminal bronchiolar carcinoma This disease is believed to be caused by a virus that can readily be transmitted to healthy sheep when they are housed with diseased animals Dungal[12] and his associates report one instance of successful transmission of the disease by an intrapulmonary injection of a tissue suspension Efforts to isolate a virus or other specific agents have been unsuccessful The histological characteristics of jaagsiekte consist of epithelial proliferations forming papillary intra-alveolar masses, which are noninvasive, singularly preserving the alveolar septa Aynaud[13] has reported an instance of metastases in lymph nodes and subcutaneous tissues in jaagsiekte De Kock[14] has suggested that jaagsiekte may actually be a true neoplastic disease However, more proof is required before this hypothesis can be accepted

SUMMARY

A clinical and histological study of 33 patients with terminal bronchiolar carcinoma of the lung is presented In the majority of these cases the disease ran a rapid clinical course Chest pain and cough were the commonest presenting symptoms In 15% the disease was asymptomatic and was discovered by routine roentgenographic studies of the chest A positive cytological diagnosis of cancer was made in nine instances The distinguishing feature of terminal bronchiolar carcinoma of the lung is seen in its gross and microscopic appearance Grossly, it has been divided into two forms—nodular (70% of this series) and diffuse (30% of this series) Cytologically, the two forms are identical The only effective treatment is surgical excision Two of the patients in whom surgical intervention was attempted prior to 1945 are alive and well, one had a lobectomy and one a simple excision of the mass Both were in the early stage, in which a limited procedure was sufficient to eradicate the disease Nine patients with more extensive disease required pneumonectomy Four are dead, and five are living, six months to two years after operation Another means of treatment that requires more study and trial is a combination of surgery and irradiation, in this procedure the primary bulk of diseased tissue is excised, and interstitial radon in the form of gold seeds is placed in the remaining inoperable cancer External irradiation can then be more accurately directed to the well marked residual cancer The relation between this disease entity and so-called pulmonary adenomatosis, and jaagsiekte disease, is discussed

INTESTINAL VOLVULUS PRECIPITATED BY LEAD POISONING

REPORT OF FIVE CASES

Knute E Berger, M D , Seattle

and

Einar A Lundberg, M D., La Oroya, Peru

Our purpose is to present observations supporting our belief that intestinal volvulus may be precipitated by plumbism, a sequence of events unmentioned in the literature as far as we can determine

It is well known that in some world areas, such as the Baltic region, volvulus may be a major cause of intestinal obstruction, reaching incidences as high as 50% of all obstructions[1] Among the natives of the highlands of Peru as seen at this hospital,[2] volvuli also cause about 50% of all obstructions seen The majority of these are of the sigmoid colon

We have observed repeatedly at autopsies and at abdominal operations that the natives of this area generally possess a long, redundant, mobile megasigmoid, usually with a narrow pedicle-like mesosigmoid predisposed to twist Of the factors mentioned in the literature as being of import in the development of such anatomically long sigmoids, the two factors that stand out most here are distinctly increased dietary roughage and congenital development A third factor, the elevated altitude, conceivably may play a role. It has been observed by us and others that persons living at this (12,200 ft) and higher altitudes often experience "bloating," flatulence, anorexia, abdominal discomfort, and, often, episodes of diarrhea without ascribable cause, all probably representing manifestations of disturbed gastrointestinal function related to environmental hypoxia, because these symptoms disappear on return to sea level[3]

Of the five cases to be reported, four volvuli involved the sigmoid and one, the small bowel All the patients had worked in the lead plant eight months to seven years, and at the time of hospitalization they showed pronounced evidence of lead absorption, as well as prior symptoms consistent with gastrointestinal plumbism merging into those of volvulus

It seems generally agreed that during an episode of lead poisoning of the gastrointestinal type, there is an

intestinal turmoil consisting of uncoordinated muscular spasms of the intestinal tract, giving rise to the colic[4] Lead poisoning can closely mimic intestinal obstruction with colicky pain, nausea, vomiting, obstipation, and even abdominal tenderness Distention however is not described as a prominent feature in pure lead poisoning, few instances of it being cited in the literature[5] However, we have observed distention in several instances of uncomplicated lead colic with various grades of colonic and small bowel distention discernible both on physical and radiographic examination Intravenous administration of calcium is of great help in the differential diagnosis by relief of the pain of pure plumbism, the symptoms of a superimposed organic obstruction persisting[6]

It is our belief that, as observed in this population group (persons with these anatomically long sigmoids described above), the effects of plumbism may precipitate a volvulus In one case following (case 5), the small bowel was involved, and there was no anatomical lesion at operation to account for volvulus

These cases are emergencies If brief conservative measures do not release the volvulus, one must immediately perform an operation

REPORT OF CASES

CASE 1 —G Y G, a Peruvian native, 54, who had worked in the lead smelter for seven years, was admitted with generalized crampy abdominal pain of six hours duration without nausea and vomiting, but preceded by constipation for several days He had experienced one previous attack of gastrointestinal plumbism, which had responded to the usual treatment (intravenous administration of calcium) Examination disclosed pallor and a definite lead line of the gums The abdomen was somewhat distended, quiet, and not tender A plain radiograph disclosed rather pronounced distention of the colon The hemoglobin was 16 Gm per 100 cc the erythrocytes numbered 4,260,000 per cu mm[7] There were numerous stipple cells in the blood smear

He was treated with meperidine (demerol®) hydrochloride, calcium intravenously, and enemas with neostigmine (prostigmin®) bromide, with partial relief of pain, and passed noticeable amounts of gas Despite this during the ensuing six hours, his distention increased and his general condition deteriorated Reevaluation pointed to probable sigmoid volvulus Major surgical intervention was judged out of the question because of his poor condition, and cecostomy alone was done with the hope that transient benefits from proximal decompression along with interim supportive measures would permit more radical surgical treatment However, such benefits never accrued, and the patient died two days later with evidence of peritonitis and uremia Autopsy confirmed volvulus and gangrene of the sigmoid with rupture of the involved loop and peritonitis

On the basis of this unfortunate experience, our first encounter with combined plumbism and volvulus, we decided to increase our index of suspicion for associated volvulus in natives with evidence of lead absorption and adopt a more radical approach, because the treatment of lead poisoning and volvulus is antithetical While pure plumbism is treated with anodynes, calcium, enemas, and bowel stimulants, sigmoid volvulus that does not readily reduce with brief conservative means is a surgical emergency[8]

Campbell and Smith[1c] have since warned against the inadequacy of cecostomy alone in sigmoid volvulus, as used in this case and illustrated as well in other literature, with this view, we heartily agree

CASE 2 —P S R, 26, a Peruvian native who had worked seven years in the lead furnaces was admitted with a history of colicky abdominal pain for 11 days For three days there had been nausea and anorexia but no vomiting He had noted progressive muscular weakness and cramps in the extremities, but his bowels had moved daily *Blood loss from the usual avenues was denied Examination disclosed pallor* of the skin and mucous membranes He was suffering from spasmodic abdominal pain There was a definite lead line along the incisors The abdomen was soft, flat, and without muscle spasm or localizing signs of any kind There was weakness of extension at both wrists and the strength of grip as tested with the dynamometer was distinctly reduced The porphyrin test showed dark red fluorescence[9] The hemoglobin was 13 6 Gm. per 100 cc, leukocytes 6,600 with 66% polymorphonuclear leukocytes Numerous erythrocytes showed basophilic stippling The urine showed 2 + albumin The icterus index was 15 The *blood Kahn test was normal The diagnosis was plumbism* of the gastrointestinal type, and the patient was accordingly treated with calcium intravenously, vitamins meperidine hydrochloride, atropine, and enemas There appeared to be improvement, during the next two days, but during the following three days he increasingly complained of colicky epigastric pain Reexamination disclosed a soft abdomen with slight tympany and tenderness in the epigastrium There was no rebound tenderness or muscle spasm, tachycardia, or fever A plain radiograph of the abdomen showed a distended colonic loop with fluid levels, and a barium enema indicated changes consistent with sigmoid volvulus (fig 1)

Exploratory laparotomy was carried out immediately, the diagnosis being sigmoid volvulus When the peritoneum was opened, odorless straw-colored fluid escaped, and hugely distended colonic loops were present The colon was decompressed using Carrington Williams maneuver, this being productive of large quantities of brown fluid and gas[10] The sigmoid was twisted 360 degrees in a clockwise direction as viewed from the position of one facing the abdomen It was a paddle shaped loop 3 ft. (91 44 cm) in length This loop was resected, and immediate end to-end anastomosis carried out with the use of a closed technique with the Furniss clamp *Proximal decompression* was carried out through a tube cecostomy The postoperative course was uneventful except for a small wound abscess, which was promptly drained and healed When the bowels were moving normally, the cecostomy tube was removed on the 14th postoperative day, the fistula promptly closing (fig 2) Antilead treatment was continued postoperatively Basophile aggregation count was not performed until three weeks after admission, at which time it was 1 8% The result of the porphyrin test at this time was faintly rose

This case shows the development of volvulus while therapy was being given for plumbism, the abdominal symptoms increasing under calcium treatment A proximal vent, established at the time of an anastomosis done on the unprepared colon, permits immediate, continued decompression, early cleansing of the colon by irrigation, and the introduction of succinylsulfathiazole or other agents as accessory safeguards against breakdown and infection at the anastomotic site In cases of plumbism in which the lead may continue to act on the bowel postoperatively with increased ileus and dyskinesia because of its action on the musculature, cecostomy is an additional protective measure providing decompression The fistula closes promptly if the anastomosis is not stenotic

[10] Williams C and Williams C., Jr Surgical Aspiration of the Bowel in Advanced Obstruction, Ann Surg. 131: 846-852 (June) 1950

Case 3—M A de la C, 27, a Peruvian native laborer at the lead furnaces for 13 months, was admitted with diffuse abdominal colicky pain for a period of eight days, worse for the preceding three days This was accompanied by vomiting, progressive constipation, and no bowel movements for two days The symptoms had failed to abate with two days' treatment with calcium intravenously in the outpatient clinic The patient was afebrile There was a definite lead line along the pyorrheic lower central incisors Wrist extension and dynamometer grip were weak The abdomen was somewhat distended without spasm or rigidity, and generally tender to pressure but without rebound tenderness He complained of cramps in the extremities Laboratory studies revealed pronounced basophilic stippling, a mild leucocytosis, urinary albumin of 1 +, and a normal blood Kahn test The result of the urinary porphyrin test was deep rose A plain radiograph of the abdomen suggested sigmoid volvulus, and this was confirmed by barium study (fig 3)

Immediate exploratory laparotomy revealed beefy colored fluid and a huge, obstructed, redundant sigmoid twisted 360 degrees in a clockwise direction about a narrowed mesosigmoidal pedicle Carrington Williams' decompression and immediate resection by open end to-end anastomosis were carried out, with removal of the 2½ ft (76 20 cm) sigmoid A proximal vent was established by tube cecostomy The postoperative course was uneventful, the cecostomy tube being removed on the 12th postoperative day, at which time the bowel movements were normal Barium enema 26 days later showed a normal sigmoidal course (fig. 4) Basophile aggregation count could not be done until the 19th postoperative day, at which time it was 1 2%, and the result of the porphyrin test was faintly rose Antilead treatment was continued postoperatively, as well as penicillin and streptomycin therapy

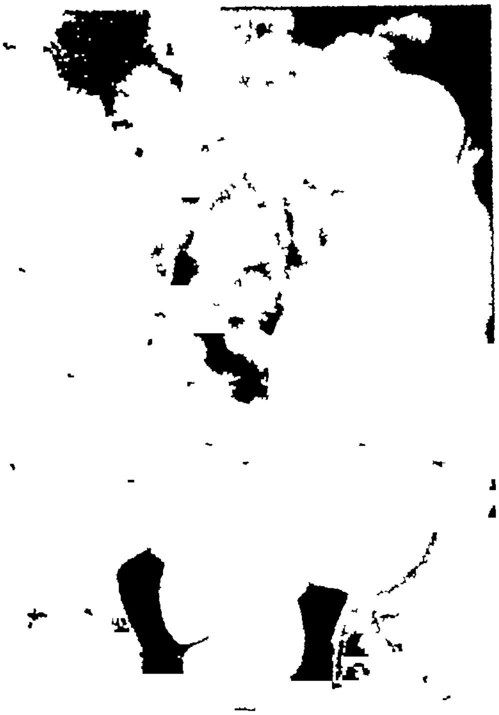

Fig 1 (Case 2)—Note the huge sigmoid As determined at operation the barium column stopped abruptly in the lower segment of the twisted sigmoid at the distal point of obstruction The proximal colon is distinctly distended

This case, similar to the one preceding, was handled radically with good success, and we have done immediate resections on volvuli of the sigmoid not involving lead poisoning with equally good results It is well known that simple detorsion, which may have to be done at times, is not the best mode of surgical treatment of sigmoid volvulus because of the high incidence of recurrence[11] Baronofsky has reported successful cases of immediate resection on the obstructed colon[12] Pierini advocates one stage end-to-end procedures as the treatment of choice in sigmoid volvulus[13]

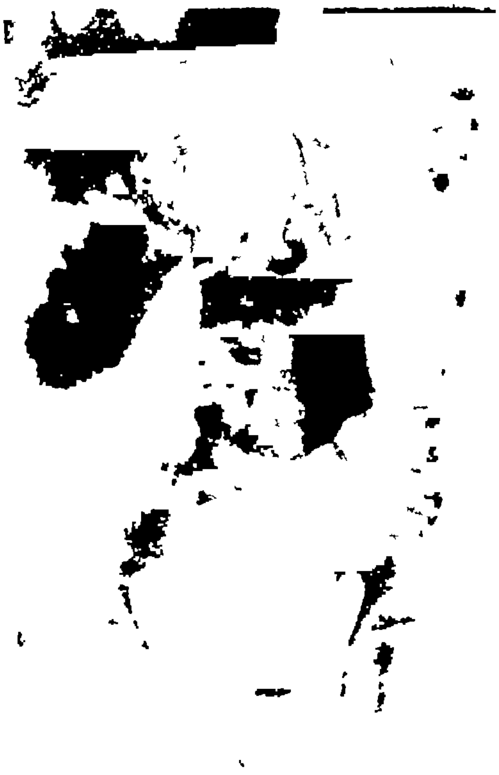

Fig 2 (Case 2)—Barium enema 25 days postoperatively showing a normal sigmoidal course with minimal redundancy and no constriction at the site of anastomosis

Case 4—A Peruvian native lead smelter worker, 42, was admitted with a history of pain in the abdomen, arms, and legs of 15 days duration For six days prior to admission, there was a history of nausea without vomiting and obstipation Purgatives had caused aggravation of abdominal pain without laxative effect, and 24 hours before admission, an enema was given with return of only ½ L. The patient had worked for eight months in the lead smelter, and there were no difficulties antedating the present episode Physical examination showed a man in acute distress who was obviously anemic He had a well-defined lead line of the gums as viewed with a magnifier and good light The extensors of the forearms were weak most distinctly on the right, there was weak grip as measured by the dynamometer The abdomen was moderately distended and tympanitic with moderate epigastric and infraumbilical tenderness elicited on palpation No masses or spasm were present The bowel tones were numerous, but there were no rushes and the rectal examination was normal Laboratory data revealed hemoglobin of 14 Gm and leucocytes 6 000 with a normal differential. The blood smear showed punctate basophilic stippling The urine showed 2 + albumin and the result of the urine test for coproporphyrins was positive Abdominal plain roentgenogram showed a distinctly distended

proximal large bowel, which was gas filled, and the barium enema showed a redundant sigmoid colon, the column stopping abruptly in the left colon

The complaints decreased after the barium enema and it was felt that this procedure had untwisted an incompletely twisted sigmoid (less than 360 degrees) He responded to intravenous administration of calcium, vitamins, and repeated enemas For the first two or three days, enemas were productive of little gas and feces, but because improvement was gradual, if not dramatic, and the clinical condition of the patient was good, immediate surgical intervention was not deemed necessary On the third hospital day the results of enemas were excellent, and thereafter the bowels functioned normally with and without the aid of purgatives Elective resection has not yet been recommended this patient being under continued observation and ambulatory antilead treatment.

CASE 5—P E C, a Peruvian native laborer, 20, in the lead plant for two years was admitted with a chief complaint of crampy abdominal pain and obstipation for five days He had recently noted anorexia and weakness, but there had been no nausea or vomiting, or peripheral cramps There had been no previous episodes Examination disclosed a fairly well-developed and fairly well nourished man with pallor of the mucous membranes and a lead line of the gums There was no fever, the pulse rate was 100 The abdomen was moderately distended and tympanitic with some prominence and tenderness in the epigastric region There was no muscle spasm or rebound The grip was weak as measured with the dynamometer, but extension was not discernibly weakened Laboratory findings included a positive result in the urinary porphyrin test, and the blood smear showed basophilic stippling Hemoglobin was 13 6 Gm A plain radiograph of the abdomen showed pronounced gaseous distention of the colon, as well as multiple loops of distended small bowel with fluid levels in some, these being in the upper abdomen A barium enema ruled out sigmoid volvulus, but because of the high location of the cecal shadow, an ileocecal volvulus was suspected In view of these observations and the failure of the symptoms to abate with intravenous administration of calcium, it was felt that surgical exploration was indicated

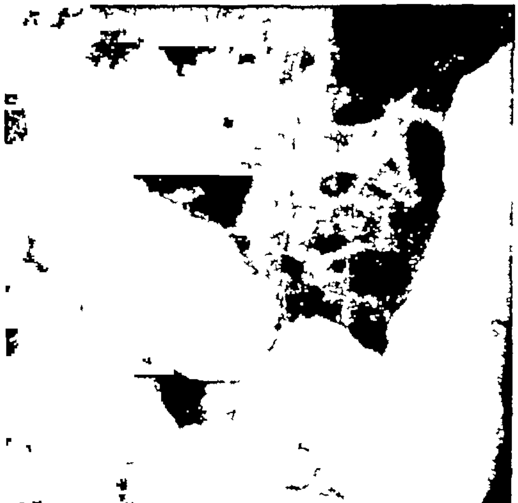

Fig 3 (Case 3)—Barium enema showing greatly elongated sigmoid the barium column stopping in the region normally occupied by the splenic flexure but in actuality this represents only the distal half of the obstructed sigmoid Note the hugely distended proximal colon

Laparotomy revealed an excess of clear peritoneal fluid The small bowel mesentery was twisted clockwise 360 degrees the distal half of the small bowel being collapsed while the proximal half was dilated, edematous, and distended with liquid content. Except for scattered petechial hemorrhages, there was no significant impairment of the circulation either of small bowel or its mesentery There were no congenital abnormalities located, the cecum was anchored higher than usual, and the large redundant sigmoid was not twisted Simple detorsion was carried out, and calcium therapy was continued postoperatively Recovery was uneventful

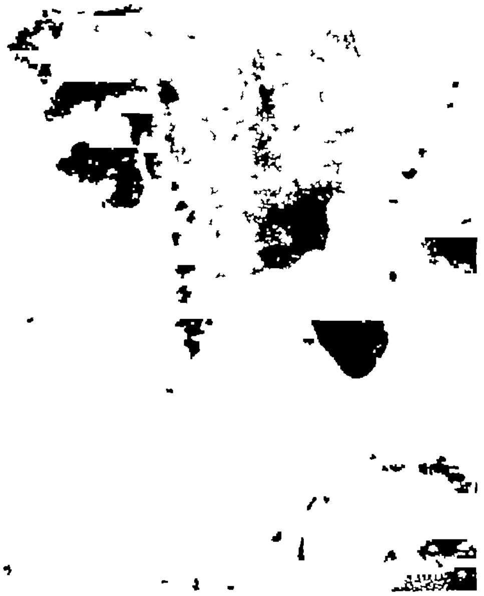

Fig. 4 (Case 3)—Barium enema 26 days later showing a normal sigmoidal course without undue redundancy and with slight but asymptomatic narrowing at the site of primary anastomosis

In this instance it would appear that because of the action of lead on the bowel volvulus may sometimes occur in the absence of contributory anatomical abnormalities

SUMMARY AND CONCLUSIONS

Five cases of volvuli associated with lead poisoning, four involving the sigmoid and one the small bowel, are presented There was one fatality through our failure to recognize early that both volvulus and lead poisoning were present, the other four patients recovered Two cases required prompt surgical intervention for complete sigmoid obstruction, and immediate resection was successful The small bowel case required only detorsion One other case underwent spontaneous detorsion during a diagnostic barium enema The role of plumbism in the precipitation of volvulus is discussed In all the cases presented, symptoms consistent with those of gastrointestinal plumbism preceded by a matter of days the more acute symptoms heralding the onset of volvulus To us, this temporal relation between these two diseases is so clear that we feel it is justifiable to relate them causally and to conclude that intestinal volvulus may be precipitated by lead poisoning, especially in those instances in which a megasigmoid or other predisposing factor exists

PHENACEMIDE IN TREATMENT OF EPILEPSY

Mary W Tyler, M D , North Chicago, Ill
and
Ernest Q King, M D , Washington, D C

The purpose of this paper is to classify and tabulate the extensive clinical reports on the use of phenacemide (phenurone®) in the treatment of epileptic seizures, in order to attain a clearer picture of the uses and limitations of the drug which might otherwise not be available and to acquaint physicians with an anticonvulsant drug which, when used alone or in combination with other anticonvulsants, is capable of relieving certain patients of seizures which are not affected by other antiepileptic drugs known at present Since this drug is not without toxic potentialities, physicians who use it should be thoroughly acquainted with the undesirable side effects which may occur and the precautions to be observed as well as with its efficacy

This paper is not intended to discourage or interfere with subsequent publications by individual investigators On the contrary, it is hoped that those who have had experience in the use of phenacemide, particularly those using it in a relatively large series of cases, will publish their results

Phenacemide, known chemically as phenacetylcarbamide, was synthesized by Spielman,[1] and its anticonvulsant properties investigated by Richards and Everett[2] It is a drug of low toxicity when given orally to animals It possesses slight sedative action and remarkable anticonvulsant activity Doses of 400 mg per kilogram produce slight ataxia in mice and cats In all animals heart rate and respiration were not impaired Rats kept on diets containing 0 25, 0 5, and 1 0% phenacemide for 24 mo showed no significant changes in growth rate, blood status, or urine Dogs on daily doses of 100, 200, 400 and 600 mg per kilogram from six to 18 mo had normal values for blood and kidney function Liver-function tests remained normal Repeated bone-marrow smears showed normal marrow elements Cats do not tolerate phenacemide as well as do dogs and rodents Phenacemide is highly effective against supramaximal electroshock seizures and pentylenetetrazol convulsions in mice and rabbits at doses of 300 mg per kilogram orally, the effect lasting for three to four hours In a new test,[3] which produces focal seizures of a psychomotor type in animals, phenacemide was more effective than other commonly used anticonvulsants Studies in mice have shown a synergistic anticonvulsant action between phenacemide and mesantoin® (3-methyl-5 5-phenylethylhydantoin), phenacemide and phenobarbital, and phenacemide and trimethadione (tridione®)

THERAPEUTIC RESULTS

In the majority of cases, phenacemide has been used in the treatment of epilepsy when other anticonvulsants have been tried and have failed to control completely or to reduce the frequency of the seizures This method of evaluation constitutes a severe test In a total of 1,539 patients, approximately 65% have shown improvement when phenacemide was given alone or in combination with other anticonvulsants, such as phenobarbital, diphenylhydantoin (dilantin®), and mesantoin® In 539, or 35% of the total, the seizures have been completely controlled or reduced in frequency 75% or more Thirty-five per cent of the phenacemide treatments were classed as failures, either because phenacemide therapy did not bring about improvement in the patient's condition or because it became necessary to discontinue the drug when side effects occurred

When types of seizures (Table 1) were considered individually, whether they occurred alone or in combination with other types, it was found that their frequency of occurrence was reduced in 68% of the patients Sixty-three per cent of the patients with petit mal, 70% of the patients with grand mal and 68% of the patients with psychomotor seizures were benefited

* 75% reduction in frequency of seizures to complete control
† 30% to 75% reduction in frequency of seizures
‡ Not included in total.

Fifty-nine per cent of the patients with mixed types of seizures experienced definite reduction in the number of seizures

Five hundred and eighty of the total number of patients suffered from only one type of epileptic seizure (Table 2) One hundred and eighty-six had petit mal, and of these 54, or approximately 29%, showed a 75% reduction in the number of seizures or complete control One hundred and eight, or 58%, were improved There were 273 patients with grand mal of whom only 33% showed improvement Seventy per cent of the patients with psychomotor epilepsy were improved Approximately the same percentage were found to be benefited whether the psychomotor epilepsy occurred alone or in combination with other types of seizures From an analysis of these figures, which also include data from

published reports,[4] it would seem that phenacemide is most effective in controlling psychomotor seizures Disturbing personality changes are most likely to occur in patients with this type of seizure It is suggested that phenacemide be used cautiously in the treatment of patients with psychomotor epilepsy who have previously exhibited marked personality problems The incidence of control of the grand mal seizures was greatest when grand mal occurred in combination with either petit mal or psychomotor epilepsy The drug was less effective in the treatment of grand mal alone

* 75% reduction in frequency of seizures to complete control
† 85% to 75% reduction in frequency of seizures
‡ Not included in total

The results reported by the investigators who have used phenacemide in the treatment of epileptic seizures have agreed quite well, with the exception of one group[5] The patients treated by this group of investigators were those whose seizures were uncontrolled by established anticonvulsant therapy Use of phenacemide in their experience, brought about a reduction in frequency of seizures in 20 out of 63 patients, or 32%

Studies with animals have shown that phenacemide acts synergistically with other anticonvulsants An attempt was made to determine whether this is also true with humans Reports on 596 patients enabled us to determine how many of these were treated with phenacemide alone and how many with a combination of anticonvulsants Of the 596, 290 received only phenacemide Because of the presence of combined seizures in some of these, a total of 384 seizures or seizure combinations were treated Table 3 shows that phenacemide alone is effective in controlling or reducing seizures and is also effective when used in combination with other anticonvulsants

Phenacemide controls or markedly reduces the frequency of seizures to about an equal extent in adults and children[4b] One report[6] on 35 children showed that eight (23%) were entirely free of attacks for three to 17 mo Fifteen (43%) were improved, and 12 were not benefited Four of these patients had a morbilliform rash after use of the drug Two of these were able to take the drug without recurrence of the rash after it had been discontinued for a short interval The incidence of more serious side effects would seem to be lower in children than adults This is particularly true of the occurrence of severe emotional or psychological reactions[7a] In many cases where children were considered behavior problems before institution of phenacemide therapy, their behavior improved, and many were reported able to get along better in school and receive better grades

TYPE AND INCIDENCE OF SIDE EFFECTS

The side effects most frequently seen were either favorable or unfavorable personality changes The commonest manifestations of untoward reactions are decreased interest in surroundings, depression, suicidal tendencies, or, rarely, aggressiveness On the other hand, in some cases of pre-existing personality disorders improvement has been noted Personality changes have occurred in approximately 17% of all cases and have usually appeared within the first four to six weeks of phenacemide therapy The other more serious side effects which have been encountered are evidence of liver damage and changes produced on the hemopoietic system In addition, in the order of decreasing frequency (as shown in Table 4), gastrointestinal symptoms, rash, drowsiness, headache, and insomnia have been produced

PERSONALITY DISTURBANCES

Information is available as to the presence or absence of personality disorders in 350 patients previous to phenacemide therapy (Table 5) There was some evidence of psychiatric disturbances in 83, or 24%, of these patients Thirty-two, or 39%, of the 83 patients showed definite improvement after the administration of phenacemide, as contrasted with 23, or 27% whose behavior was aggravated by use of the drug In 28 patients, previously existing personality difficulties were not affected With 73% of these patients, therefore, phenacemide therapy could be continued In 19, or 5%, of the 350 patients who had not previously exhibited personality difficulties psychic changes developed after phenacemide therapy was started Depression developed most frequently. Other psychological manifestations reported were violence, paranoia, irritability, and suicidal tendencies

Since administration of phenacemide has brought about an improvement in behavior in some patients, the existence of personality disorder need not be considered a contraindication to the use of the drug, but in patients with previous psychotic background there is a greater tendency for personality disturbances to develop However, the patient should be very carefully observed, preferably hospitalized temporarily If the disorder becomes exaggerated or new personality changes occur, use of the drug should be promptly stopped Withdrawal and loss of general interest may indicate the onset of serious personality disturbance

TOXIC EFFECTS ON LIVER

As shown in Table 4, there were 31 cases in which signs of liver damage were clinically observed In 27 of these jaundice cleared when the medication was discontinued In the other four patients hepatitis was the immediate cause of death The role of phenacemide in producing liver damage is difficult to evaluate in two of the cases [7] These deaths occurred during the early stage of the clinical investigation, before the possible hepatotoxic effects of phenacemide were realized At the time of writing, there have been no reports of deaths during a period of 14 mo This, in all probability, is due to closer supervision of the patient by the physician and to the observance of recommended precautions

It is difficult to evaluate the reports of abnormal deviation of liver function, as shown by tests such as cephalin flocculation and thymol turbidity and flocculation In some cases these tests have become positive, but continuation of the drug has not produced further indication of liver damage Urine urobilinogen excretion was not significantly increased, and no retention of sulfobromophthalein (bromsulfalein®) occurred These observations do not minimize the danger of possible liver damage but show that laboratory findings must be correlated with sound clinical judgment in the use of the drug, which has been implicated in the production of pathological changes in the liver Urine urobilinogen determinations should be made on all patients before phenacemide therapy is started and at frequent intervals thereafter If the test becomes positive to a degree considered significant (1 to 20 or over), other liver-function tests should be made, preferably the sulfobromophthalein retention

TABLE 5—*Special Study of Personality Changes*

		No	%
Total no of patients		350	
Patients with previous psychological disturbances		83	24
Effect of phenacemide	Personality improved	32	39
	Personality worse	23	27
	No change	28	31

BLOOD CHANGES

Blood changes have been reported in 36 patients Leukopenia (leukocyte count of 4,000 or less per cubic millimeter of blood) was the commonest condition observed, and it developed in 22 patients while phenacemide was being given The leukocyte count returned to normal in 20 patients upon withdrawal of the drug In the other two patients death, due to aplastic anemia,[8] occurred The role of phenacemide in producing aplastic anemia is uncertain In one patient [9] other anticonvulsant medications were used concurrently [8a] In the second patient [8b] other antiepileptic medications had been given with phenacemide for a time, but they had been discontinued some weeks before the onset of toxic symptoms

OTHER SIDE EFFECTS

Gastrointestinal symptoms were reported in 130, or 8%, of 1,539 patients (Table 4) Anorexia, nausea, and vomiting occurred most frequently In some patients these symptoms were severe enough to require discontinuing the drug Administration of vitamin B complex has controlled these symptoms in some patients Rash was observed in 79, or 5%, of the patients In most patients this indicated a real sensitivity to the drug In a few patients a second trial with phenacemide did not produce a recurrence of the rash Abnormal urinary findings were reported in 21 patients In recent months there have been no reports of damaging effects on kidney function Drowsiness has been noted in 4% of the patients, headache in 2% Insomnia, fatigue, and dizziness have been seen less frequently Insensitivity to pain was reported in one patient [10]

DOSAGE

The dose of phenacemide must be individualized, based on the response of the patient It has been observed by some investigators that side effects are less likely to develop if the dosage is gradually built up to that which will control the seizures It is recommended that if some degree of control of seizures has been obtained with other medication such medication be continued and phenacemide added at a dosage of 0 5 gm three times a day The dosage of phenacemide should be increased above this starting dosage until seizures are controlled or limiting side effects develop If it seems that the control of seizures can be maintained with use of phenacemide alone, other medication can be reduced, but if a combination of phenacemide with other drugs produces better control of seizures, or allows control to be maintained with a lower dosage of phenacemide or with less disturbing side effects, the combination should be continued as maintenance medication It is recommended that an initial course of 0 5 gm three times a day at meals be prescribed to adult patients After one week an additional 0 5 gm may be taken when the patient rises, and in the third week the dose may be increased by 0 5 gm at bedtime An average dose of 2 to 3 gm per day has been adequate for most adults If seizures continue in spite of medication and the drug is well tolerated, the dosage may be increased at a more rapid rate than that suggested above Doses up to 5 gm per day have been given However, some patients obtain relief with small doses, for instance, one 0 25 gm tablet three times a day, but will not tolerate large amounts For children of 5 to 10 yr approximately one-half the adult dose is recommended Since the duration of action of the drug appears to be three to five hours, the above distribution of dosage would be optimal The maintenance dose should be the smallest amount which will adequately control seizures

Precautions —For the safety of the patient the following precautions must be observed

1 Except in carefully selected patients, phenacemide should not be administered until other accepted anticonvulsants have been tried and found ineffective in controlling epileptic seizures

2 A careful history should be taken to determine the presence or absence of pre-existing personality disorders Since phenacemide has brought about an improvement in behavior in many patients, the existence of personality disorder need not be considered a contraindication to the use of the drug However, the patient should be very carefully observed Should the disorder become exaggerated or undesirable personality changes occur, the drug should be promptly withdrawn

3 A careful history regarding previous allergic reactions to drugs should be taken

4 Careful clinical observation of the patient, particularly during the early months of treatment, is very important Gastrointestinal upset, general malaise, and fever may be indicative of early liver damage or blood dyscrasia psychological signs such as withdrawal and loss of general interest may indicate the onset of serious personality disturbance It is recommended that the interval between examinations be not more than two weeks for the first four months and monthly thereafter

5 The patient or his family should be advised that the use of phenacemide entails a certain risk which must be weighed against the possible benefits to be derived The patient and his family must be instructed to watch for the occurrence of a dark urine or yellow sclera, the occurrence of a rash, or evidence of gastrointestinal upset, such as anorexia, nausea, and vomiting In addition, the family must be instructed to look carefully for changes in the behavior of the patient If any of these changes occur, they must be reported promptly to the physician In some patients the gastrointestinal symptoms have yielded to treatment with vitamin B complex, which has permitted the continued use of phenacemide

6 Complete blood counts should be made before institution of phenacemide therapy and at monthly intervals thereafter If no abnormality occurs within 12 mo , the interval between counts may then be extended Emphasis should be placed upon erythrocyte and leucocyte counts and the total number of polymorphonuclear cells per cubic millimeter of blood, as these are a better index of possible blood dyscrasia than the percentage of cells

7 The patient should be carefully observed for evidence of liver damage The urine urobilinogen test is the simplest test and can be performed in the physician's office If this becomes positive (1 to 20 or more), other liver-function tests should be done The sulfobromophthalein retention test is suggested The drug should be used with caution to patients with histories of previous liver dysfunction.

8 Only enough phenacemide to last for a designated interval should be prescribed

CONCLUSIONS

The statement regarding the use of anticonvulsant drugs which appeared in a fairly recent article [11] seems *entirely logical*

---

[10] Forster F M and Frankel K. Insensitivity to Pain as a Complication of Phenurone Therapy in Epilepsy Dis Nerv System 11 24 (Jan.) 1950

[11] Abbott J A and Schwab R S Serious Side Effects of Newer *Antiepileptic Drugs Their Control* and Prevention New England J Med. 242 943 (June 15) 1950

An efficient drug whose side effects can be largely prevented by care should not be condemned because of a small number of serious side effects attributed to its use in the literature Instead an understanding and perhaps overcautious, protective regimen should be set up and meticulously followed If this is done, side reactions tend to become fewer and fewer, and patients are not deprived of therapy they need

Phenacemide (phenurone®) has proved to be effective in controlling or definitely reducing the frequency of seizures in a fairly large percentage of patients who have not responded to other anticonvulsant drugs However, four deaths due to hepatitis and two due to aplastic anemia were reported prior to the initiation of controls for observing the patients Personality changes may also develop The drug should not be used unless other established anticonvulsants have failed to be effective The patient or his family should be fully aware of the nature of the drug and of the side effects which may be produced They should realize there is a certain risk which must be weighed against the possible benefits derived from its use The physician should instruct the patient to watch for signs of toxicity and report them promptly The patient should be seen by the physician at frequent intervals To this end, only enough phenacemide to last for a short, designated interval should be prescribed

HEMOPTYSIS IN MITRAL STENOSIS

A C Thompson, M D , Elkins, W Va ,
and
William C Stewart, M D , Charleston, W Va

Although the fact that mitral stenosis may cause hemoptysis long has been recognized, little emphasis apparently has been placed on its occurrence or prognostic significance Indeed, there is a paucity of literature on this subject. Stewart,[1] in 1934, reported three cases with autopsy findings He enumerated five situations in which blood appears in the sputum of patients suffering from mitral stenosis, namely, (1) pulmonary edema, (2) pulmonary infarction, (3) during the course of primary pneumonia, (4) paroxysmal pulmonary hemorrhage as described by Oppenheimer and Schwartz,[2] and (5) as a sign of "acute cardiac failure" More recently, Wolff and Levine [3] reported 50 cases of mitral stenosis with no selection of cases as to etiology of the hemoptysis

In reviewing hospital records of these cases, it became apparent that there is considerable lack of understanding of this problem, especially in the absence of congestive failure In the investigation of the symptom, bronchoscopy was carried out in two cases, in one of which the patient was put at bed rest for eight months in spite of a normal chest x-ray Disturbed by the recent publicity regarding the early symptoms of cancer, these patients now, more than ever, demand an explanation of the cause of the hemoptysis, and the physician should be aware of the frequency of its occurrence in mitral stenosis For these reasons a discussion of this subject seems justified

MECHANISM

In addition to the pulmonary or lesser circulation, the lungs have a bronchial blood supply at systemic pressure which nourishes the stroma. These bronchial arteries follow each bronchus and its subdivisions, but ultimately this blood joins the pulmonary arterial blood through bronchopulmonary anastomoses Distinct bronchial veins are found only at the hilus of the lung, the greater part of the blood of both bronchial and pulmonary arteries being returned by way of the pulmonary vein If inflammation, thrombosis, or embolism involving smaller branches of the pulmonary artery occurs, alterations take place in this dual circulation, the bronchial arteries rapidly increase in size,[4] and a collateral circulation is established Ferguson, Kobilak, and Deitrick,[5] in 11 autopsied cases with mitral stenosis, were able by injection methods to demonstrate dilated venous channels, in four of which cases there were innumerable wide submucosal channels running parallel to the lumina of the secondary and tertiary bronchi They are apparently beyond the visualization of the bronchoscope In four of the 11 cases there was a history of hemoptysis, and dilated venous channels were demonstrated in three of them, the fourth had acute hemorrhagic bronchitis, making it impossible to see these vessels It was the opinion of these observers that the increased pressure in the pulmonary vein in the presence of mitral stenosis surpassed the pressure in the right auricle, causing a reverse flow of blood through the anastomoses with dilatation to handle the collateral flow

Bland and Sweet,[6] who have successfully increased the collateral flow in these cases by a venous shunt between the azygos and pulmonary veins, found pressure readings from 425 to 535 mm of water in the left auricle at the time of surgery (normal being about 100 mm) Ferguson [5] and his group compared bleeding from these bronchial varicosities to that of hemorrhoidal or esophageal varices which, like bronchial veins, are submucosal

shunts between large venous areas A severe coughing spell, mild ulcerative bronchitis, or any rise in the left auricular pressure could initiate such attacks of hemoptysis Wolff and Levine[3] suggested that sclerosis of pulmonary vessels was a necessary precursor of hemorrhage, however, two of Ferguson's four patients with hemoptysis showed no evidence of pulmonary sclerosis Diapedesis of blood has been suggested as a mechanism but seems incredible as an explanation of large quantities of frank blood such as is seen in many cases of mitral stenosis

MATERIAL

Records of 85 cases of mitral stenosis admitted to the Charleston General Hospital were reviewed, of which 15, or 17 7%, had a history of hemoptysis In addition, 83 cases of mitral stenosis seen in the private practice of one of us (W C S) were reviewed, of which number, 14 carried a history of hemoptysis making a combined total of 17 3% All cases in which hemoptysis could be attributed to pneumonia or pulmonary infarction or to any other incidental cause were eliminated, as we were interested only in those cases in which the hemoptysis was consequential to a stenosed mitral valve We found that the cases fell into three distinct groups which will be presented and discussed separately These groups are (1) those with none to slight cardiac enlargement with no congestive failure, (2) those with moderate to great cardiac enlargement without signs of congestive failure, and (3) those with moderate to great enlargement of the heart, with congestive failure

GROUP ONE

In Group 1, there were 10 cases, in eight of which the patients were women The age range was from 19 to 36 years, averaging 27 years at the time of onset of hemoptysis The length of time since onset of hemoptysis averaged 37 months, varying from one to 70 months All patients were well when last seen

Brief histories of three representative cases are given.

Case 1 —Mrs B F H , aged 32 years, had rheumatic fever in childhood, and was found to have mitral stenosis nine years ago About one year before this report, she coughed up one pint (473 cc) of blood, and since then had spit a considerable quantity of blood on three or four occasions There had been no cough nor any wheezing Her exercise tolerance was good, and there were no symptoms of congestive failure Several chest x-rays, a bronchogram, and three bronchoscopic examinations were noncontributory

Physical examination revealed the following blood pressure 116/70, mitral stenosis with slight cardiac enlargement, sinus rhythm, no signs of congestive failure

Case 2 —Mrs E E T , aged 23 years, had chorea at the age of 12 years Three and one half years before this report hemoptysis had occurred after intercourse Recently, on two occasions, hemoptysis had followed intercourse For two days previous to examination the patient noted slight dyspnea on exertion Her exercise tolerance was otherwise good

Physical examination revealed the following blood pressure 106/70, heart not enlarged, typical presystolic rumble of mitral stenosis, with sinus rhythm, no signs of congestive failure

Case 3 —Mr V W aged 25 years, was admitted to the hospital May 13, 1949, with chief complaint of coughing up blood The patient gave a history of intermittent hemoptysis, usually after exertion, for two years X ray of the chest made two years previously had been noncontributory Three days previous to admission the patient coughed severely, with moderate hemoptysis (sufficient to regurgitate into the nose) No other symptoms except slight dyspnea on exertion were present

Physical examination revealed the following blood pressure 130/70, mitral stenosis, with no cardiac enlargement, sinus rhythm, no signs of congestive failure X ray of the chest revealed clear lung fields, there was no evidence of mitral configuration Electrocardiogram showed diphasic P waves and right axis deviation The patient was discharged May 19, 1949, with his condition unchanged

The patient was readmitted Oct 2, 1949, with a history of persistent, severe hemoptysis of one week's duration The physical findings were unchanged except for moderate anemia The red blood cell count was 3 million, with 62% hemoglobin Treatment consisted of small transfusions, the hemoptysis ceasing Oct 6, 1949 A recent communication from his family physician stated that the patient had been seen recently, was feeling well, and was working

The cases in this group are comparable with those designated by Bland and Sweet[6] as "tight mitral stenosis " This type of case associated with hemoptysis constitutes the greatest puzzle to the physician, since there usually is no genuine evidence of congestive failure and the exercise tolerance often is quite good In only three of our cases did the history indicate that hemoptysis occurred after exertion This fact is surprising, since apparently all observers agree that blood spitting occurs as a result of increased pulmonary hypertension In the cases just summarized, the amount of blood varied from scanty to an amount sufficient (in one case) to produce moderate anemia It seems reasonable to conclude, therefore (as did Wolff and Levine[3]), that hemoptysis in this group offers no prognostic significance Not only were all these patients living after an average period of 36 months, but none of them had any significant cardiac enlargement Of the five patients seen during the past year, the average length of time since onset of hemoptysis has been 45 months

GROUP TWO

There was a striking difference in ratio of male to female in Group 2 as compared with Group 1, there being 12 males and one female The onset of hemoptysis occurred at ages ranging from 18 to 41 years, with an average age of 33 years Auricular fibrillation had developed in five cases, and there were aortic lesions in four When these patients were last seen, the average length of time since onset of hemoptysis was 44 months

Brief histories of a few cases in this group follow

Case 1 —Mrs M P , aged 42 years, had had rheumatic fever as a child In 1944 there was beginning loss of cardiac reserve In 1945, while in congestive failure, she coughed up bloody sputum About two years previous to this report, while running a vacuum cleaner, she suddenly coughed up about a pint of bright red blood There was no increased dyspnea before or after this episode, and she did not go to bed She was not on a digitalis regimen at that time There had been no hemoptysis since During the two weeks previous to examination marked congestive failure had developed

Physical examination revealed the following blood pressure 92/60, bilateral hydrothorax, aortic and mitral stenosis and insufficiency, auricular fibrillation with extreme cardiac enlargement

The patient responded well to treatment and was discharged in one week, much improved

Case 2 —Mr R F , aged 29 years, had had rheumatic fever at the age of 16 There was beginning loss of cardiac reserve five years previous to this report with dyspnea on exertion About four and one half years previous to this report he had hemoptysis with a bout of left sided failure He was relieved by a shot' after coughing up large quantities of bright red blood, and the coughing continued until hospital admission On this occasion the hemoptysis was not associated with dyspnea nor with orthopnea

Physical examination revealed the following blood pressure 100/70, heart enlarged to the left, typical murmurs of mitral stenosis and insufficiency minimal passive congestion of lungs X ray of the chest showed enlargement of the left auricle, with mitral configuration and slight passive congestion

The patient was treated expectantly with maintenance doses of digitoxin and sedation Hemoptysis continued subsiding in six days.

CASE 3 —Mr J L L., aged 39 years, was seen in August, 1947, giving a history of rheumatic fever at the age of 3 years There had been gradual loss of cardiac reserve since 1940 In April, 1946, he coughed up some blood He was in frank failure in December, 1946 The patient when last seen was dyspneic on exertion, there was orthopnea but no edema

Physical examination revealed the following blood pressure 150/80 lungs clear, mitral stenosis with auricular fibrillation Marked cardiac enlargement was revealed by examination and fluoroscopy

We have been informed that this patient died in congestive failure in May, 1949

CASE 4 —Mr C N A, aged 37 years, had had rheumatic fever at the age of 20 Valvular involvement was noted 10 years previous to this report He was dyspneic and had raised blood eight months previous to this report Two weeks previous to being seen, he had another attack, with hemorrhage There was no edema, and no dyspnea on exertion

Physical examination revealed the following blood pressure 130/84, lungs clear, moderate enlargement of heart, mitral stenosis, with sinus rhythm

The patient was seen again Jan 19, 1948, with a history of recent severe hemorrhage He knew of no reason for the attack and has been well since, with no symptoms of congestive failure His lungs were clear

When seen again Nov 9, 1948, the patient's condition was unchanged (This patient is known to be still living)

Evaluation of this group offers the most difficulty Classification was attempted by determining from the history, to the best of our ability, whether or not the hemoptysis occurred while the patient was *not* in congestive failure, although four patients had a history of congestive failure prior to onset of hemoptysis It is recognized also that some of these patients may have had normal-sized hearts at the time of hemoptysis, several years before a record was made of the heart size Ten patients in this group are known to be alive, and all but two have been seen in the past year by one of us Three, or 23 per cent, have died 17 months, 38 months, and 10 months, respectively, after onset of hemoptysis In the series of cases reviewed by Wolff and Levine,[3] 22 of which would appear to fall in this group, 11 were dead at the end of six months after onset of hemoptysis Of the 12 cases in our group with an adequate follow-up (the 13th case having been followed for only one week after onset), all survived for six months, 11 survived for one year, 10 for two years, and six are known to have survived for four years or longer Although any accurate evaluation from a statistical standpoint could be made only if all the cases had been followed until death, it seems likely that these patients survived as long as they could have had they never had a hemoptysis

GROUP THREE

Six cases fell in Group 3, four of these being males and two females The patients' ages ranged from 16 to 45 years, averaging 33 5 years at the time of onset of hemoptysis Half of the number had fibrillation and four had aortic lesions Three (50%) of these patients are now dead

Brief reports of representative cases in this group follow

CASE 1 —Mr E J, aged 33 years, had had rheumatic fever at the ages of 12 and 16 years He was unable to work for two years because of extreme lack of cardiac reserve Marked orthopnea and edema developed one month previous to hospital admission

Physical examination revealed the following blood pressure 150/60/0, moderate respiratory distress, marked pulmonary congestion, extreme enlargement of the heart, with aortic and mitral stenosis and insufficiency, liver enlarged, grade-4 edema of the legs Fluoroscopy of the chest revealed marked enlargement of all chambers of the heart and marked pulmonary congestion The electrocardiogram was interpreted to show left bundle branch block

This patient's course continued downhill Twelve days after admission to the hospital he began spitting up moderate quantities of dark red blood, continuing to do so until he died, two days later

CASE 2 —Mrs B B, aged 46 years, was admitted to the hospital Oct. 20, 1949, with a history of rheumatic fever in 1925 She complained of paroxysmal nocturnal dyspnea of two years duration, with blood streaked sputum one year previous to admission She had had marked orthopnea for one week

Physical examination revealed the following blood pressure 128/74, moisture in the right lung base, aortic and mitral stenosis and insufficiency, with auricular fibrillation heart moderately enlarged (This patient is known to be still living)

CASE 3 —Mrs P R., aged 32 years, was admitted to the hospital June 20 1948 with no history of rheumatic fever or chorea Onset of cardiac symptoms with failure occurred near term of a previous pregnancy four years ago The patient was in the seventh month of pregnancy when seen for cardiac symptoms, onset of dyspnea and orthopnea having occurred two weeks previously On the day before admission to the hospital, she coughed up a moderate amount of blood which was bright red This was her seventh pregnancy, with no abortions

Physical examination revealed the following blood pressure 100/60 acute pulmonary edema present, also mitral stenosis, with auricular fibrillation heart moderately enlarged X-ray of chest revealed prominence of left ventricle, mitral configuration, and marked pulmonary congestion The patient responded well to treatment, and subsequently was delivered at term with no difficulty

In all the cases in this group the only stress necessary for hemoptysis to occur was the burden of congestive failure, with the added burden of pregnancy in the first trimester in one case (Mrs P R) Whereas all patients in Group 1 and all but one patient in Group 2 had had repeated bouts of hemoptysis, only one in Group 3 had had more than one bout None of these patients had massive hemoptysis, two instances were described as moderate Three patients are dead, two days, five days, and 50 months, respectively, after onset of hemoptysis The average period of survival for the entire group was 14 months, while that for the number known to be dead was 19 months Although congestive failure is in itself an ominous prognostic sign, it would appear that hemoptysis in this group increases the likelihood of impending death

SUMMARY

Of 168 cases of clinically diagnosed mitral stenosis seen both in the hospital and in private practice, 29 carried a history of hemoptysis Cases were not included in this group unless the sputum was heavily streaked with blood or consisted almost entirely of frank blood The amount of blood raised varied and, although as much as a pint was raised in some cases, it was never a serious

threat to life The amount of blood coughed up had no prognostic significance since several of the patients who suffered the largest hemorrhages subsequently have done best

Prior to the suggestion by Ferguson [5] and his associates that hemoptysis in mitral stenosis is due to rupture of varices of the bronchial veins, no plausible explanation of this symptom had been offered, and while the idea is credible, proof that such rupture actually is the mechanism producing the hemorrhage is not conclusive since several patients in this series underwent bronchoscopy with no bronchial varices being noted

An attempt has been made to place these patients in three groups, largely on the basis of heart size and the presence or absence of congestive failure Group 1 includes patients with slight or no cardiac enlargement and no congestive failure Group 2 includes those with moderate to great cardiac enlargement and no congestive failure Group 3 includes those with moderate to great cardiac enlargement, with congestive failure

Patients in Group 1 correspond to those considered by Bland and Sweet [6] to have "tight mitral stenosis " These observers noted that acute pulmonary edema in their patients was at times associated with hemoptysis In several of our cases the patients were suffering from acute pulmonary edema at the time of their hemoptysis, but in most instances this was not true In three cases in this group, hemorrhage was severe but not dangerous The threat of pulmonary edema is a more compelling reason for the venous shunt operation devised by Bland and Sweet than is the danger of subsequent hemorrhage All our patients in this group have had more than one episode of bleeding, but their prognosis has nevertheless been good All cases have been observed for an average follow-up period of 36 months, and none has shown any appreciable deterioration The predominance of females in this group, as noted also by Bland and Sweet,[6] is striking

Thirteen patients have been seen who had had one or more episodes of hemoptysis, and who had moderate or great cardiac enlargement, who were not in congestive failure at the time hemoptysis occurred In some of these cases congestive failure subsequently has developed, but a particular effort was made to determine that congestive failure was not present at the time of hemorrhage before including the case in this group In most instances, careful follow-up in these cases has shown that hemoptysis was an isolated episode and not related to any worsening of the patient's cardiac condition In some of these cases the failure of hemoptysis to alter the patient's prognosis was very impressive Six patients in this group have survived for more than four years, and several of them have continued at their usual occupation

Six patients who had large hearts and who were in congestive failure have had hemoptysis Two of these died of congestive failure in two days and five days, respectively, after hemorrhage One patient lived for 50 months, and died in recurrent congestive failure The three survivors do not provide a statistically significant follow-up It appears that patients with mitral stenosis in congestive failure who have hemoptysis probably do not do so well as those not suffering a hemoptysis In view of the beneficial effect of reducing blood volume by venesection in congestive failure, this situation is difficult to explain It is possible that study of a larger number of cases in this group will reveal that hemoptysis has not actually contributed significantly to the decline of the cardiac condition

Disturbances in the metabolism of potassium are a problem of clinical significance The study of the behavior of this ion in disease was accelerated by the development of the flame photometer [1] This instrument has allowed rapid quantitative determinations to be made in volume Considerable information, primarily on a research basis, has accumulated concerning mechanisms of shifts in body potassium [2] and the symptoms and signs associated with these changes [3] Relatively little information, however, has been tabulated concerning the prophylaxis or therapy of potassium deficits, except in a few selected situations, such as infantile diarrhea,[4] diabetic acidosis,[5] and a small series of postoperative patients [6]

The following report summarizes briefly the mechanisms responsible for deficits of potassium and the associated clinical symptomatology Actual experience as to the etiology and treatment of potassium deficits in 150 patients is tabulated and discussed, with recommendations concerning treatment schedules

MECHANISMS CAUSING DEFICITS OF POTASSIUM

Intracellular and Extracellular Potassium Deficits — In general, there are two mechanisms which may cause loss of potassium from both the intracellular and extracellular compartments of the body The first is inadequate intake of potassium This occurs when food intake is restricted and parenteral fluids which do not contain

[1] Hald P M The Flame Photometer for the Measurement of Sodium and Potassium in Biological Material J Biol. Chem **167**: 499 (Feb) 1949 Berry J W Chappel D G and Barnes, R B Improved Method of Flame Photometry Indust & Engin Chem (Analyt Ed) **18** 19 (Jan 15) 1946

potassium are used Potassium deficits arise in such situations because the urine is never potassium-free, and the ion continues to be lost from the body although none is supplied [7]

The second mechanism is the accelerated loss of potassium from the body The two major routes for the excretion of potassium, in health, are the urine (90%), and the stool (10%) Increased excretion in the urine may occur because of altered tubular function, with impaired reabsorption Altered tubular function may be caused by changes in pH, notably alkalosis,[8] shock, anoxia, hormones (desoxycorticosterone acetate),[9] and pathological changes in the tubules secondary to various types of renal disease, such as the healing stages of the upper or lower nephron nephrosis,[10] rare forms of primary renal tubular disease, and occasional instances of chronic glomerulonephritis Accelerated potassium excretion in the urine also occurs in any state associated with a negative nitrogen balance of any etiology as potassium, often in excess of the nitrogen loss, moves out of the cells with nitrogen during tissue catabolism [2] This action has been demonstrated recently secondary to corticotrophin (ACTH) and cortisone therapy [11] Administration of large volumes of isotonic saline may cause loss of potassium by diuresis [12] Increased loss of potassium in the urine also occurs with dehydration [6]

Since 6 to 7 L of gastrointestinal fluid—gastric juice, bile, pancreatic fluid, intestinal fluid—with a potassium concentration which varies but is usually approximately equal to or higher than that of the extracellular fluid [13] is secreted daily into the intestinal tract and reabsorbed, important loss of potassium from the body may occur if the gastrointestinal content is lost via fistulas of any type, nasogastric suction apparatus, or diarrhea

Deficit of Extracellular Potassium —Rapid shifts of potassium from the serum and interstitial fluid into the cells of the body occur because of the effect of drugs or other substances which accelerate either carbohydrate or protein synthesis Thus, insulin,[14] large amounts of dextrose,[15] and testosterone [16] cause a shift of potassium from the extracellular to the intracellular compartment The rare disease known as familial periodic paralysis [3] also causes a rapid shift of potassium from the extracellular to the intracellular fluid Any factor, as administration of large volumes of parenteral fluid, that results in hemodilution will also cause a drop in serum potassium concentration [12]

The serum potassium level is adequate for most clinical purposes, since the symptomatology of potassium deficits can usually be correlated with the serum concentration Also, the intracellular levels (which cannot be determined) are usually reflected by the serum concentration if hydration and renal function are normal

SYMPTOMS AND SIGNS OF POTASSIUM DEFICIT

Symptoms and signs of potassium deficit have usually been related to the change in the serum potassium level (Some workers feel that the balance between the extracellular and intracellular components may be the more important factor [17] Decreased serum potassium concentration affects neuromuscular physiology involving skeletal muscle, cardiac muscle, and the smooth muscle of the gastrointestinal tract Weakness to paralysis of the muscles of the trunk and extremities (rarely the muscles supplied by the cranial nerves) may occur when the serum potassium level falls below 8 to 10 mg per 100 cc (2 05 to 2 56 mEq per liter) [18] Changes in conduction, irritability, and contractility of cardiac muscle occur with levels under 10 to 12 mg per 100 cc (2 56 to 3 07 mEq per liter) These changes are manifested by alterations in the electrocardiogram,[3] consisting of prolongation of the Q-T interval, and occasionally the P-R interval, S-T depression, and decrease in amplitude and change in contour of the T waves Clinically, systolic murmurs and gallop rhythms, cardiac dilatation, and hypotension have been noted If the potassium deficit is severe, cardiac arrest and death may occur Actual necrosis of cardiac muscle has been produced by potassium depletion [19] Lowered serum potassium may affect the musculature of the gastrointestinal tract to cause decreased motility and inhibition obstruction (adynamic ileus) [20]

INCIDENCE AND CAUSE OF POTASSIUM DEFICIT IN 150 PATIENTS

In the two-year period March 1, 1948, to March 1, 1950, there were 6,196 serum potassium determinations made in patients in a 3,000 bed hospital The flame photometer mentioned earlier was used in these studies Results in 1,803 (29 1%) determinations were lower than 15 mg per 100 cc (3 84 mEq per liter) and 383 (6 2%) were higher than 23 mg per 100 cc (5 89 mEq per liter), giving a total of 35 3% abnormal determinations (The normal range for serum potassium in our laboratory is 16 to 22 mg per 100 cc [4 1 to 5 6 mEq per liter]) The increasing number of determinations per month, as more knowledge of

and interest in electrolyte problems developed, is clearly demonstrated by the increase from 26 serum potassium determinations in March, 1948, to 509 determinations in August, 1949

The figure of 6,196 determinations represents approximately 3,098 patients This figure is estimated on the basis that each patient had two potassium determinations (This estimation was obtained from the figures for two periods—January, 1949, and November, 1949—when each patient had 1 7 and 2 08 determinations, respectively) The number of patients with a low serum potassium level, using the figure of two determinations per patients, would be approximately 1,000 for the two-year period (This is in a hospital of 3,000 beds)

One hundred and fifty of these patients, the majority of whom were seen by us in the six-month period from January to July, 1949, form the basis of this report (We constituted a committee who supervised potassium therapy during this six-month period, until the problems involved became adequately clarified and the procedures standardized) There were 100 patients who had medical conditions or unoperated surgical conditions, and 50 postoperative surgical patients The vast majority of the patients (122, or 81%) had gastrointestinal disorders, such as intestinal obstruction, cholecystic disease, peritonitis, pyloric obstruction, pancreatitis, and gastrointestinal malignancy A small group (28, or 19%) were due to a variety of causes, as diabetic coma undergoing vigorous insulin therapy (10 patients), renal disease (five patients), and acute infection (five patients)

Table 1 tabulates the basic etiology responsible for the low serum potassium in each patient. The significant role of poor or no potassium intake as a cause of low serum potassium is demonstrated since 131 of the 150 patients (87 4%) had decreased potassium intake Ninety of these 131 patients were on nasogastric suction and were receiving parenteral fluids which did not contain potassium The average period the patients were on nasogastric suction prior to the development of the low serum potassium was 5 3 days, plus an average of 7 5 days of poor or no food intake prior to the use of naso gastric suction Forty-one of the patients were not on nasogastric suction but had had prolonged periods of poor or no food intake, averaging 16 3 days

Nine (6%) of the 150 patients had a low serum potassium due to accelerated loss of potassium from the body via the urine or gastrointestinal tract—nasogastric suction, fistulas, or diarrhea

Ten (6 7%) of the 150 patients had low serum potassium levels owing to the rapid shift of potassium from the extracellular fluid into the cells under the influence of insulin used in the therapy of diabetic coma

The importance of alkalosis as a cause of serum potassium deficits is demonstrated by the fact that 64 (42 7%) of the patients had alkalosis, in addition to the mechanisms listed in Table 1 Acidosis was present in 15 patients (10%), occurring primarily in those patients with diabetic coma or diarrhea Thirty-six per cent of the patients had a normal carbon dioxide combining power, and 11 3% had not had a determination of the carbon dioxide combining power

While it was frequently impossible to evaluate the symptoms and signs due to hypopotassemia in the presence of a serious primary disease, an attempt was made to determine the relation of the serum potassium level to the state of the patient and the outcome The clinical condition of 34 patients (22 6%) with a serum potassium under 10 mg per 100 cc (2 56 mEq per liter) was very poor, as evidenced by such findings as profound muscle weakness, inhibition obstruction (adynamic ileus), cardiac dilatation, hypotension, and gallop rhythms

Electrocardiograms were taken on many of the patients These tracings showed the characteristic changes described in hypopotassemia in the majority of instances

In retrospect, 10 patients (6 7%) may well have died of hypopotassemia

TREATMENT RESULTS

The problems in therapy resolved themselves into three considerations (1) the best type of solution to use and the mode of administration, (2) the prophylactic requirement for potassium in patients who were not eating, and (3) the average amount of potassium required to correct acute and chronic deficits

Type of Solution —The solution to be used for the prophylaxis and treatment of potassium deficits in a large hospital had to be simple to prepare and in such form as to be practical for use in many different types of electrolyte imbalance For these reasons we used potassium chloride, 1 gm in 15 cc of distilled water, prepared in vials and autoclaved, as our stock solution for intravenous use The proper number of grams of potassium could then be added to whatever intravenous solution was required for other purposes, as dextrose in water, isotonic saline, ⅙ molar sodium lactate, or 0 9% ammonium chloride

TABLE 2 —*Potassium Requirement Calculated from Balance Studies*

Diagnosis	Potassium in Urine (Range) Gm	Potassium in Naso-gastric Suction Fluid (Range) Gm	Total Potassium Lost (Range) Gm 24 Hr	Total KCl Required on Basis of Measured Loss Gm /24 Hr

* Received 0.5 gm K.

For prophylaxis of potassium deficits we used a 0 1 to 0 2% solution of potassium chloride (1 to 2 gm of potassium chloride per liter of any type of intravenous fluid required) given no faster than 1 L (1 gm) per hour For therapy of serious potassium deficits we used a 0 3 to 1 0% solution (3 to 10 gm of potassium chloride per liter of any type of intravenous fluid required), administered slowly and followed by frequent serum potassium determinations or electrocardiograms (This solution is hypertonic and may cause pain in the vein We have seen no thrombi from its use) Potassium has also been administered in any of the fluids which can be given by hypodermoclysis, in 0 1 to 0 2% concentration, without local reactions

For oral administration we used a 1% potassium chloride solution, as it was frequently necessary to administer this medication through a nasogastric tube

Prophylaxis of Deficits —Table 2 shows the average daily loss of potassium via the urine and in the nasogastric suction fluid in four patients who were not receiving potassium and in whom potassium balance studies were done The daily potassium requirement in these patients, expressed as grams of potassium chloride, varied from 1 8 gm to 6 1 gm

The 24-hour loss of potassium in nasogastric suction fluid varied in our patients from 0 1 to 1 4 gm The concentration of potassium in the gastric fluid varied from 5 to 51 mg per 100 cc (1 3 to 13 1 mEq per liter) with an average of 20 to 30 mg per 100 cc (5 12 to 7 68 mEq per liter) An average range of urinary potassium loss cannot be given, since the amount varied widely, depending on the serum potassium concentration, the urine volume, renal function, and pH of the blood

The prophylactic requirement of potassium chloride to maintain a normal serum potassium level in five patients receiving parenteral fluids for several days varied from 2 to 6 4 gm of potassium chloride, with an average of 4 gm While such studies are obviously less accurate than balance studies, since the amount of potassium required is not known unless the urinary potassium excretion is measured, certain information can be obtained from them concerning range of dosage

From such studies we concluded that 3 to 6 gm of potassium chloride daily is an average prophylactic amount for patients requiring several days of parenteral fluid therapy We prefer to err on the side of too much rather than too little potassium for prophylaxis, since excess potassium is readily excreted by the kidney unless renal function is seriously impaired

Treatment of Acute and Chronic Deficits —Our experience in the correction of potassium deficits has developed with practice and is documented, with illustrative examples from the series of 150 patients, in Tables 3, 4, and 5

With a large staff of interns and residents, considerable caution was entertained early with regard to rapid correction of deficits, because of the potential dangers of intravenous potassium therapy If symptoms were not alarming, it was felt wiser to take several days to correct deficits Thus, early, far too little potassium was given per day (2 to 6 gm of potassium chloride), so that many days elapsed before the serum level became normal With low serum potassium levels of long standing, large amounts of potassium are required, as can be seen in Table 3, where in 15 patients the requirements for correction of the serum level varied from 8 to 35 gm of potassium chloride given over a period of 3 to 21 days

Table 4 illustrates more rapid, competent correction of acute and chronic potassium deficits This Table also illustrates the difference in the amount of potassium chloride required to correct acute deficits (3 to 9 gm), as contrasted with chronic deficits associated with serious cellular depletion (33 to 40 gm)

As the result of our studies, shown in Tables 3 and 4, we now give 3 gm of potassium chloride intravenously in 24 hours for the correction of acute deficits This is in addition to the prophylactic maintenance dose of 3 to 6 gm For serious, chronic deficits we now give 10 to 20 gm of potassium chloride intravenously in 24 hours, or 10 gm intravenously and 10 gm orally, if the oral route can be used

As soon as patients are able to eat, potassium deficits usually cease to be a problem since an adequate amount of potassium can be obtained from the average diet for maintenance and gradual correction of deficits For this reason we have laid little stress on oral potassium, usually, if the patient is able to take oral medications, some form of diet can also be taken. Oral potassium in liquid form has been administered to some patients through a nasogastric tube It has also been used to supplement the dietary intake of potassium in some instances

The results of potassium therapy in five patients with diabetic coma are listed separately, as this is a somewhat special problem In patients 1, 2, and 3 in Table 5, potassium administration was started early in the course of the treatment of the diabetic coma, with the result that the serum potassium was maintained at a normal level throughout treatment. In patients 4 and 5, therapy was started only after a drop in the serum potassium had occurred The amount of potassium required to correct the body potassium deficit in these five patients ranged from 8 88 to 20 48 gm of potassium chloride in 24 hours

As the result of the above experience and other studies in diabetic coma,[5c] we now give 12 to 16 gm of potassium chloride to all patients in diabetic coma during the first 24 hours of intensive insulin therapy, starting as soon as serious dehydration is corrected and renal function is known to be adequate Two to 4 gm of potassium chloride is given intravenously as a 0 1 to 0 2% solution, and 10 to 12 gm orally as a 1% solution

There were several infants and children in our series of 150 patients with potassium deficits The majority of these patients had infantile diarrhea In most instances we used the formula recommended by Govan and Darrow[4] for infants and children (0 20 gm of potassium chloride per kilogram of body weight per 24 hours)

HIGH SERUM POTASSIUM LEVELS

For completeness, it might be briefly stated that high serum potassium concentrations occur because of impaired glomerular filtration, hemoconcentration, rapid tissue breakdown, or too rapid intravenous administration of potassium Therapy is frequently difficult The type used depends on the etiology of the increased level, and includes extrarenal removal of potassium by such procedures as the artificial kidney, renal removal by diuresis induced by large volumes of isotonic saline administered intravenously, shift from serum into the cells by use of insulin and dextrose, and antagonism of the physiological effects of high serum potassium by the use of calcium In our series, high serum potassium levels were usually associated with impaired renal function or hemoconcentration

COMMENT

Our clinical results are in accord with present concepts of the mechanisms of potassium loss as outlined above The largest number of deficits occurred in patients with poor or no intake of potassium, and many were related to the occurrence of alkalosis A smaller number of serum potassium deficits were due to accelerated loss from the body via gastrointestinal content loss, urinary loss, or rapid shift into the cells in the therapy of diabetic *coma*

While the gross mechanisms of potassium changes in the body are known, many of the fundamental problems, such as the mechanisms by which potassium enters the cell against a high diffusion gradient, the factors governing tubular reabsorption, and the forces that prevent cellular potassium from being supplied to correct serious but small extracellular deficits, are unsolved

Since the normal kidney can conserve potassium rigorously in the face of need, it is hard to understand why, in the presence of a supply of potassium from tissue breakdown (this occurs in most postoperative patients or patients who are not eating), the serum level cannot be maintained In some patients, factors, such as alkalosis or shock, which alter the ability of the kidney to conserve potassium are known, but in other patients the mechanisms are obscure and may well be hormonal In this regard we have seen a few patients on nasogastric suction receiving potassium-free parenteral fluids, who nevertheless maintained a normal serum potassium level for some time (five to 10 days) This is presumably owing to the derivation of potassium from tissue breakdown, combined with decreased renal excretion

The two major problems in therapy are the hazard of intravenous potassium administration and the estimation of the amount of potassium required to correct deficits The hazard of intravenous therapy lies in the narrow range of normal serum potassium 16 to 22 mg per 100 cc (4 1 to 5 6 mEq per liter) and the small amount of potassium in the total extracellular fluid (1 5 to 2 5 gm) Small alterations in the serum potassium may be lethal, since death due to cardiac standstill occurs at serum potassium levels between 40 and 50 mg per 100 cc (10 26 to 12 8 mEq per liter) One to 2 gm of potassium given rapidly may cause such a concentration This is avoided by dilution of the potassium in a liter of fluid

When a serious potassium deficit associated with symptoms is present, large amounts of intravenous potassium are urgently required If frequent serum determinations cannot be made, the direct writer electrocardiogram is an excellent method of following the serum potassium level[21] With the use of serial tracings, a fairly good estimation of the serum concentration can be made from the character and height of the T waves Potassium can be given safely until the T waves become high and peaked

Since the body store of potassium is approximately 150 to 175 gm , most of which is in the cells, 20 to 40 gm of potassium chloride may be required to correct serious deficits In such circumstances, intravenous therapy appears to be of little hazard since there is a rapid shift of the administered potassium into the depleted cells

While we were well aware of the value of previously recommended repair and prophylactic fluids[22] (particularly those containing such ions as calcium, magnesium, and phosphate), we were faced with the problem of being unable to obtain more than one solution for both prophylaxis and repair of potassium deficits Also, we prefer to "tailor make" repair solutions to meet the particular electrolyte problem involved This is done most easily by the use of stock solutions of potassium, calcium, or magnesium, added to the ordinary standard intravenous fluids, such as isotonic saline and 5 to 10% dextrose in water or saline, in the amounts required to correct the particular deficit or deficits

SUMMARY

In the two-year period, March, 1948, to March, 1950, 6,196 serum potassium levels were determined Of the levels, 29 1% were low and 6 2% were high Approximately two serum potassium determinations were done per patient

The disease entities and the mechanisms responsible for serum potassium deficits in 150 patients, the majority of whom were seen during a six-month period by us, are tabulated One hundred and thirty-one (87 4%) patients had various types of gastrointestinal disorder Ninety patients (60%) were on nasogastric suction and were receiving no potassium in their parenteral fluids They had an average of 7 5 days of poor or no intake of food before suction was started and an average of 5 3 days on suction before the serum potassium was found to be low Forty-one patients (27 4%) who were not on nasogastric suction had had a prolonged period of poor or no food intake, averaging 16 3 days As to the role of acid-base balance, 42 7% of the patients had alkalosis, 10% acidosis, 36% a normal carbon dioxide combining power, and 11 3% had no determination of the carbon dioxide combining power

Results of therapy are listed As the result of our studies, the following treatment schedule is suggested for adults For prophylaxis of potassium deficits, in patients who are not eating and are maintained on parenteral fluids, 3 to 6 gm of potassium chloride intravenously is required daily in 0 1 to 0 2% concentration (1 to 2 gm per liter of whatever intravenous solution is required)

For the correction of deficits assuming adequate renal function the following is suggested

For recent, acute deficits, 3 gm of potassium chloride daily given intravenously as 0 1 to 0 2% solution until deficit is corrected is recommended, in addition to the daily prophylactic dose

[21] Stephens F 1 Paralysis Due to Reduced Serum Potassium Concentration During Treatment of Diabetic Acidosis Ann Int. Med 30 1272 (June) 1949

[22] Footnotes 4 and 5a Burnett, C. H., and Barrows B A Repair Solutions in the Treatment of Metabolic Acidosis and Alkalosis M Clin North America 32 1293 (Sept) 1948

In cases of diabetic coma undergoing treatment, 12 to 16 gm of potassium chloride should be given during the first 24 hr of intensive insulin treatment—2 to 4 gm of potassium chloride intravenously (0 1 to 0 2% concentration), and 10 to 12 gm orally Therapy should be started as soon as dehydration is partially corrected and renal function is found to be adequate

In severe chronic deficits, 10 to 20 gm of potassium chloride should be given intravenously as a 0 3 to 1% solution, or 10 gm intravenously and 10 gm orally, if the oral route of administration is possible

For infants the dosage schedule recommended by Darrow (0 20 gm of potassium chloride per kilogram of body weight per 24 hours) may be used

HYPOVENTILATION SYNDROME IN BULBAR POLIOMYELITIS

Stanley J Sarnoff, M D , James L Whittenberger, M D
and
John E Affeldt, M D , Boston, Mass

Because of the complex nature of respiratory inadequacy due to bulbar poliomyelitis and the severity of associated disturbances in acutely ill patients with this disease, there is little precise knowledge of the disturbed respiratory mechanism itself In a patient whose muscles of respiration do not coordinate and whose respiratory air flow pattern is grossly irregular, it is sometimes difficult to tell whether the irregularity is caused by involvement of the respiratory center or by the airway difficulties engendered by cranial nerve involvement Detailed attention to the maintenance of a clear airway, auscultation over the larynx, and visual observation of the character of the patient's respiratory effort often help to differentiate respiratory center involvement from the irregularity that arises as a result of the protective reflexes that are invoked to prevent the pulmonary aspiration of mucus and saliva

The gross irregularity of breathing and the ventilatory inadequacy which may be associated are part of the classical picture of bulbar poliomyelitis, and have been adequately described by numerous observers When a clear airway has been ensured and the respiratory defect persists, the latter is then attributable to respiratory center involvement The nature of the defect may be apparent clinically in two ways (1) gross irregularity of the rate and rhythm of respiration, and (2) incoordination of the various muscles of respiration In addition, a third and perhaps more important type of respiratory defect occurs This has received passing notice by the clinician,[1] but has not been subjected to precise investigation

This third type of respiratory defect in bulbar poliomyelitis, or what shall be termed the hypoventilation syndrome, consists of a decreased sensitivity of the respiratory center to the partial pressure of carbon dioxide in arterial blood This results in lowered pulmonary ventilation which, in these circumstances, is not attributable either to a compromised airway, to a significant defect of lower motor neurones or muscles of respiration, or to the incoordination of respiratory motor activity It is attributable to a diminished respiratory drive, and in some ways is analogous to the situation in which the respiratory center has been depressed by an overdose of barbiturate The hypoventilation syndrome is the subject of this communication

During the course of an investigation of the management of respiratory difficulties in bulbar poliomyelitis, four patients were seen whose respiration was such as to include them for consideration in this category [2] The first of these was a 17-year-old male with bulbospinal poliomyelitis, who at times breathed at a rate of only 4 respirations per minute and became cyanotic when permitted to lapse into these periods of bradypnea Underventilation could be prevented, even though his mental state was somewhat clouded, simply by giving him fairly frequent and firm verbal orders to breathe Later grossly irregular and inadequate breathing developed in this patient and he was treated with electrophrenic respiration during that period [3] The second patient was a 43-year-old woman with bulbospinal poliomyelitis who exhibited the same phenomenon but was more refractory to voluntarily sustaining adequate ventilation because of her mental state That is to say, she responded to single and repeated orders to breathe more deeply, but would not continue to do so for more than two or three breaths after the last command The third and fourth patients were 9 and 11-year-old boys with bulbar poliomyelitis Inasmuch as they were the only ones in whom quantitative data were obtained, only their cases will be reported in detail

METHOD

Arterial blood gas tension analysis by the method of Riley and others [4] was begun within 20 min after obtaining the samples The arterial oxygen and carbon dioxide contents were determined by the method of

Van Slyke and Neill [5] Electrophrenic respiration (EPR) was administered by applying an intermittent electrical potential over the motor point of the phrenic nerve [6] Respiratory air flow patterns were taken with the clinical pneumotachograph of Silverman and Whittenberger [7]

REPORT OF CASES

CASE 1 —A B, a boy aged 9 years who was admitted to the hospital Sept 25, 1949, had had coryza and moderate headache for three days prior to admission The following day a slight fever and stiff neck developed, and this was followed with difficulty in swallowing, a nasal voice, and regurgitation through his nose on the day before admission On admission, the temperature was 102 4 F, pulse 104, and respirations 32 The patient was drowsy and irritable, and an accumulation of secretions was noted in the pharynx He exhibited moderate stiffness of the neck, and spasm of the back and hamstring muscles Both divisions of the left facial nerve were paralyzed The tongue deviated slightly to the left and the palate to the right, with poor motion on both sides There was thought to be slight weakness of the right anterior tibial muscle and the left upper abdominal reflex was absent

The cerebrospinal fluid contained 210 white blood cells of which 80% were lymphocytes The Pandy test for globulin showed a trace, the test for sugar being negative The blood pressure remained in the vicinity of 110/80

The patient s temperature fell to normal, and there did not seem to be any progression of the paralysis Although the mental state was somewhat clouded, it was felt that the patient was doing reasonably well until 5 00 a m of Sept 27, at which time it was noted that his respirations became quite shallow, without becoming either rapid or irregular, for varying periods of time, and that this hypoventilation was severe enough to cause a definite change in his color Accordingly, oxygen was administered by nasal catheter These periods of hypoventilation alternated irregularly with periods of apparently adequate ventilation until seen by us later that morning

Observation of the patient during the subsequent six hours confirmed the above description of the patient's respiratory status The alternation of periods of hypoventilation with periods of adequate ventilation occupied more prolonged time intervals than were consistent with Cheyne-Stokes breathing. There was no apparent regular periodicity or rhythm to the changes Rather, the period of hypoventilation seemed to last as long as the patient was quiescent and undisturbed

As soon as the patient was aroused, or spontaneously became restless, respiration returned to apparently normal proportions To demonstrate further that the patient had full control of his respiratory muscles, it was but necessary to ask him to breathe forcefully If urged, the patient was capable of performing inspiratory motions that appeared to approach the inspiratory limit of his vital capacity, with vigorous excursion of both his diaphragm and intercostal muscles

Quantitative evidence was obtained concerning the blood gas tensions during these different phases of respiratory activity The nasal oxygen was discontinued at 2 05 p m on Sept 27, a needle was subsequently introduced into the right femoral artery, and three 10-cc samples were obtained The first was drawn at 2 55 p m, after about two minutes of commanded hyperventilation The needle was left in situ and the patient permitted to remain undisturbed with moderate hypoventilation until 3 12 p m, at which time the second sample was drawn The insertion of the syringe into the three-way stopcock at this time disturbed the patient a little and increased ventilation slightly, but nevertheless this sample showed evidence of significant hypoventilation Electrophrenic respiration was then applied on the right side for seven minutes, with suppression of spontaneous respiration At the end of this time the third sample was drawn Table 1 lists the results It is evident that during command ventilation the boy had sufficient voluntary control of his respiratory muscles to accomplish considerable hyperventilation as evidenced by the low pCO and high pO_2 Likewise, stimulation of only one phrenic nerve, presumably active during spontaneous ventilation, was capable of maintaining a normal pO_2 and decreasing the pCO In contrast to this are the low pO and high pCO_2 which were present when the patient was left undisturbed to breathe according to the dictates of his diseased respiratory center

CASE 2 —T R Q, a boy aged 11 years was admitted to the hospital on Aug 24, 1950, with a diagnosis of bulbar poliomyelitis He had been well until the day preceding admission, when he had malaise, vomited three times, and had a rectal temperature of 103 F

TABLE 1 —*Data on Patient A B pO_2 and pCO_2 in Arterial Blood of Patient with Respiratory Center Involvement Due to Bulbar Poliomyelitis*

Type of Breathing	pO_2 Mm Hg	pCO_2 Mm Hg	Serum CO_2 Vol %	pH	O Content Vol %	O_2 Capacity Vol %	Saturation %
1 Forced	115	34	62 03	7 53			
2. Spontaneous	87	50	65 68	7 37	19 03	20 35	92.5
3. Electrophrenic respiration	98	27	65 98	7 65			

Normal values pO₂ 95-100 mm Hg pCO₂ 40 ± 2 mm Hg pH serum 7 40 ± 05 serum CO₂ 55-60 vol per cent (assuming the supine position and barometric pressure of 760 mm Hg)

On admission his rectal temperature was 103 6 F, his pulse was 76, and his respirations were full and regular at 20 per minute The patient was apprehensive, exhibited a nasal, gurgling speech, and was unable to swallow sips of water Additional positive neurological findings were deviation of the tongue to the right, generalized left facial weakness, and slight stiffness of the neck and back Saliva was puddled in the posterior pharynx

On Aug 24, a lumbar puncture showed 113 white blood cells of which 83 were polymorphonuclear On Sept 2, nineteen white blood cells were present, all of which were mononuclear

A pneumotachogram at 10 00 a m on Aug 25, revealed an air flow pattern that deviated little or not at all from the normal and confirmed the impression gained from gross observation of the patient s breathing (Fig 1) At 3 00 p m the air flow pattern became somewhat irregular and shallow and had pauses not usually seen in normal breathing By 7 30 p m the patient s respirations exhibited the irregularity and the series of three or four rapid short breaths that resemble panting which are frequently seen in bulbar poliomyelitis Arterial blood analysis on the morning of Aug 25 revealed a pO_2 of 95 mm Hg and a pCO of 37 mm Hg

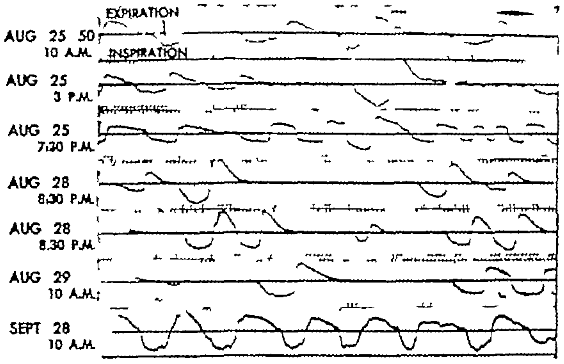

Fig 1 (Case 2) —Pneumotachograms on patient T R Q from Aug 25 to Sept 28 1950 The progress from normal on Aug 25 to abnormal and back to normal again on Sept 28 can be seen

On the evening of Aug 26, because the irregularities persisted, electrophrenic respiration was tested on this patient in anticipation of more serious difficulty It was found to function well both on the left and right phrenic nerves On this and subsequent occasions the application of electrophrenic respiration promptly suppressed all spontaneous respiration and was accompanied with a diminution or cessation of the patient s restlessness

Although the irregular respirations persisted and the patient was frequently restless and disoriented, he was not thought to be hypoventilating except for brief periods At these times verbal stimulation could re-establish apparently adequate ventilation, until 10 00 p m on Aug. 27, at which time his respiration became shallow and fell to between 6 to 8 per minute Electrophrenic respiration was applied by external stimulation and maintained by means of the bedside clamp until 2 30 p m on Aug 28, at which time, although still breathing irregularly, he was responsive and again able to maintain apparently more adequate ventilation than previously

The arterial blood gas tensions obtained on the afternoon of Aug 28 are shown in Table 2, and indicate the subnormal ventilation of this patient during spontaneous breathing Soon afterward respiratory minute volumes were obtained several times while the patient was breathing room air and again while breathing 100% oxygen (Fig 2) At 8 30 p m the pneumotachograms were still such as to indicate derangement of the respiratory center (Fig 2)

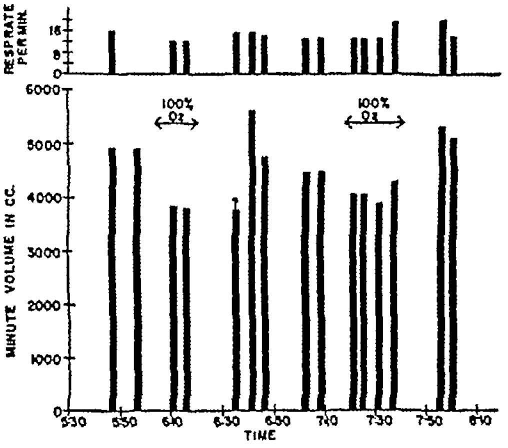

Fig 2 (Case 2)—Respiratory rates and minute volumes of patient T R Q while breathing room air and 100% oxygen. The decreased ventilation that occurred during the administration of 100% oxygen can be seen. The question mark over the value at 6 34 p m indicates what was thought to be a leak occurring during that collection period

On Aug 29, the arterial pO_2 was 96 mm Hg and the pCO_2 was 37 mm Hg It should be mentioned, however, that through an oversight the blood sample was drawn promptly after the insertion of the needle into the femoral artery, before the patient had a chance to quiet down from the reaction engendered by the needle puncture

Again at 1 00 a m on Aug 30, respirations became shallow and fell to between 0 and 4 per minute, and the patient did not react to either verbal or physical stimuli Electrophrenic respiration was again promptly applied and maintained until 8 00 a m, at which time he was again able to maintain apparently adequate ventilation Since it was felt that a catastrophe had been only narrowly avoided, the implantation of a phrenic electrode was considered so as to maintain adequate ventilation until the patient was clearly over his respiratory defect The use of the tank respirator was not felt to be indicated in this case At this point, however, the patient began to improve noticeably, and further respiratory support was not required The patient was discharged on Sept 12, and a follow up pneumotachogram on Sept 28, 1950, showed a normal respiratory air flow pattern

COMMENT

It becomes likely, in view of the data obtained on these patients, that a third type should be more clearly recognized in the classification of central respiratory defects in bulbar poliomyelitis That is, in addition to irregularities of rhythm and incoordination of muscular effort, one must postulate that an altered sensitivity to CO_2 may occur presumably as a result of involvement of the respiratory center Sedation had not been administered to these patients Patient A B (Case 1) presented the bulbar hypoventilation syndrome in relatively "pure culture," that is, without gross irregularity of rate and depth and without incoordination of the respiratory muscles Patient T R Q (Case 2), however, exhibited what we anticipate may prove much more common, namely, gross irregularity of rate and depth (Fig 1) as well as lowered sensitivity of the respiratory center to CO_2 It might well be that in other patients with bulbar involvement who show some irregularity and incoordination, this factor is also present to a significant extent, but the inadequate ventilation is attributed to the irregularity of the respiratory attempts rather than a lessening of the central respiratory drive, the diminished sensitivity of the respiratory center being masked by the more obvious motor dyskinesias

The management of this situation is simple if the patient responds to verbal or gentle mechanical stimuli with increased ventilatory efforts It is only necessary to watch him carefully, reminding him to breathe adequately when his center "forgets" to do so If he does not respond adequately to such commands, he must, of course, receive some form of artificial respiration Patient A B (Case 1) continued to lapse into his typical periods of hypoventilation with diminishing intensity for the subsequent 72 hours, the nurse in attendance reminding him to breathe each time After that period, he appeared to breathe adequately An electrophrenic respirator was kept at the bedside in order to provide for the possible emergency arising out of failure to respond adequately should that have occurred

Patient T R. Q (Case 2), on the other hand, failed to respond adequately on two occasions, and artificial respiration was clearly indicated The amount of fatigue induced in the patient by continued response to verbal commands (not to mention fatigue of the nursing personnel) must be estimated and weighed appropriately in any decision involving the question of whether or not to provide artificial respiratory support instead of verbal reminders In retrospect, one cannot help but wonder if early implantation of the phrenic electrode and steadily maintained electrophrenic respiration during the critical period would not have conferred a more reassuring margin of safety in the management of this case The concensus of the majority associated with patient T R. Q is that if presented with the same or a similar situation early electrode implantation is indicated On the other hand, if patient A B (Case 1) had had an implantation it would have been superfluous since he managed quite well without it

The spontaneous and readily induced fluctuations of the adequacy of respiration make it necessary to observe two precautions in the interpretation of blood gas data from these patients

1 The blood must be drawn in such a way as to leave the patient undisturbed, since any stimulus sufficient to irritate the patient may produce an increase in ventilation of sufficient magnitude to produce normal

blood gas values It seemed to us that the best technique was to connect a three-way stopcock to the needle after it is inserted, connect the syringe, and flush it with saline After at least five minutes, or when it is apparent that the respiratory disturbance resulting from the arterial puncture has abated, the handle of the stopcock is gently turned so as to empty a few drops of blood out the side of the three-way stopcock and then permit the blood to flow into the syringe

2 There are spontaneous fluctuations in the adequacy of ventilation from hour to hour with no apparent relation to external stimulation Data on blood obtained during the periods of more adequate ventilation would confer a false sense of security in the clinical management of the patient

In view of these factors, it is important to realize that the obtaining of blood values indicative of hypoventilation is diagnostic of the hypoventilation syndrome *in the presence of* bulbar poliomyelitis but that *normal* blood values do not provide assurance of a normal respiratory center drive at times other than at that moment when the blood was drawn The fact that normal values (Table 2) were obtained on the morning of the day (Aug 29, 1950) when the near catastrophe occurred in patient T R Q, reveals the false sense of security that normal values can produce under these circumstances In this case, the Aug 29 blood sample was obtained immediately after the arterial puncture without regard for precaution 1 mentioned above

TABLE 2—*Data on Patient T R Q pO and pCO_2 in Arterial Blood of Patient with Respiratory Center Involvement Due to Bulbar Poliomyelitis*

Date 1950	Sample	pO_2 Mm Hg	pCO_2 Mm Hg
Aug 28	Spontanous respiration *	90 5	48
	Forced respiration †	105 5	38
Aug 29	Spontaneous respiration	96 0	37

* Drawn five minutes after arterial puncture

† Drawn after two minutes of forced respiration which immediately followed the drawing of sample 1

Marshall and Rosenfeld[8] demonstrated that when the sensitivity of the respiratory center is depressed by barbiturates, the remaining activity of the center results largely from the hypoxic stimuli arising in the carotid and aortic bodies For, by giving oxygen under these circumstances and thus removing the hypoxic stimulus, the already subnormal respiratory minute volume falls even further The result is that the pCO_2 in the arterial blood, already at high levels, rises still further and may produce a secondary deepening of the respiratory center narcosis This produces a state of affairs in which, even when the oxygen is stopped, spontaneous respiration may not be resumed since, at the level of carbon dioxide present, the center may then be refractory even to hypoxic stimuli

It has been thought that the administration of carbon dioxide with oxygen under these circumstances would stimulate the lagging respiratory center to more adequate activity We feel that there are two palpable objections to such a maneuver First, the continued administration of carbon dioxide must of necessity produce a significant deviation from normal of the acid-base balance of the organism Second, the administration of carbon dioxide to a patient with a slightly or moderately elevated arterial pCO_2 might well increase ventilation However, if the patient's arterial pCO_2 already is elevated to the point where a further elevation will produce carbon dioxide narcosis and respiratory depression, it is apparent that the administration of carbon dioxide to such a patient is unwise[9]

Since the urgent demands of the critical situation sometimes preclude precise analysis before initiating therapy, we feel that inhaled carbon dioxide under these circumstances might be hazardous

Clinicians and physiologists are becoming increasingly aware that the abrupt administration of oxygen to an emphysema patient whose respiratory center has in some way become adapted to a high level of carbon dioxide (lowered sensitivity) can be hazardous[10]

There are two practical implications of the above-presented data First, there is the possibility that the respiratory center attacked by the poliomyelitis virus is depressed and that it may depend to a certain extent on the hypoxic stimulus for the level of its respiratory activity as described above Since the care of such patients frequently includes the administration of oxygen, it is suggested that the precise determination of its effect on ventilation and arterial carbon dioxide levels is highly desirable Should the administration of oxygen be accompanied with a decrease in ventilation, some form of artificial respiration is clearly indicated

Secondly, while there is a reluctance on the part of a great many persons to treat the patient with bulbar poliomyelitis in the tank respirator, it is obvious that under these conditions some kind of respiratory support is required As indicated by the sequence in the case of patient T R Q, the electrophrenic respirator may be of help under these circumstances, either alone or as a stopgap until the patient can be acclimatized to the tank respirator Although making a prognosis of any kind in poliomyelitis is hazardous, at 1 30 a m on Aug 30, when patient T R Q was breathing at a rate of 0 to 4 respirations per minute and it was no longer possible to arouse the patient by verbal stimuli, it was clear that some sort of respiratory support was required if a catastrophe was to be avoided In this episode, as in others of its kind, the brevity of the period of electrophrenic respiration required to re-establish a relatively normal sensitivity of the respiratory center was of considerable interest One other patient, reported previously,[3] also responded in this manner after eight hours of electrophrenic respiration It may be that the period of induced adequate ventilation breaks some vicious arc The latter may be thought to consist of a series of events which impose a high pCO_2 and low pO_2 on the respiratory center, thus impairing its function and in turn producing an even higher pCO_2 and lower pO_2 to the point where carbon dioxide nar-

10 Marshall and Rosenfeld[8] Comroe J H, Jr, Bahnson E R. and Coates E. O Jr Mental Changes Occurring in Chronically Anoxemic Patients During Oxygen Therapy J A M A 143 1044 1950 Grandpierre R. Franck C and Lemaire R L action paradoxale de l oxygène J physiol 42 5, 1950

cosis of the center occurs The period of induced adequate ventilation reverses this pattern and partially restores the sensitivity of the respiratory center The patient can then maintain himself until, because of some unknown factor, the sequence begins again This line of reasoning will be recognized as highly speculative, since it may well be that an increased supply of oxygen to the medulla during adequate ventilation is responsible for restoring its sensitivity It is, however, clear that the type of poliomyelitis patient described above may exhibit a severely diminished ventilation, which, if supported by artificial respiration for brief periods, may be a rapidly reversible state

SUMMARY AND CONCLUSIONS

Diminished respiratory center activity, either with or without gross respiratory irregularity and incoordination, may occur in bulbar poliomyelitis It is suggested that this results from an altered sensitivity of the respiratory center to carbon dioxide consequent to medullary involvement in this disease

Verbal artificial respiration can be effectively administered under these circumstances if the patient is responsive and is observed continuously by competent personnel, and if it is not required for too prolonged a period

This type of respiratory defect may occur more frequently than supposed, but may be masked by the more obvious abnormalities of breathing in bulbar poliomyelitis

The possible hazards of oxygen administration under these conditions have been mentioned These potenial hazards would, however, be readily overcome if any significant diminution of spontaneous ventilation is reversed by some means of artificial respiration

Electrophrenic respiration may be of help under circumstances wherein spontaneous respiration is inadequate or becomes so following the administration of oxygen It is obvious that at least one phrenic nerve must be uninvolved by the disease if electrophrenic respiration is to be used

INTRODUCTION OF BLOOD INTO THE PERITONEAL CAVITY

AN EXPERIMENTAL STUDY

William F Mengert, M D , Stephen W Cobb, M D , Dallas, Texas
and
W W Brown Jr , M D , Waco, Texas

Intraperitoneal hemorrhage is frequently encountered on an active obstetric and gynecologic service Therefore, correlation of quantity of free blood with resulting symptoms and with its fate represents information of considerable value to the clinician For this reason whole blood and other similar materials varying in amounts were introduced at varying rates into the human peritoneal cavity

SUBJECTS

Sixteen women about to undergo laparotomy formed the subjects of this study Twelve were puerperal and awaiting tubal sterilization Four had noninvasive, or intraepithelial, cervical carcinoma Preoperative patients were chosen in order to afford opportunity for direct inspection during the subsequent operation In addition, the protocols of three patients, each with accidental and massive intra-abdominal hemorrhage, were included Essential data on these 19 patients are presented in the accompanying Table

METHOD

Injections were made under local anesthesia through a 16-gauge needle inserted 2 to 4 cm below the umbilicus and usually in the mid-line Sometimes they were made in either the right or the left lower quadrant Generally, whole blood was withdrawn from the patient's antecubital vein into a 20-cc syringe, the barrel of which had been previously lubricated with mineral oil or melted petroleum jelly The use of multiple syringes and two operators made it possible to inject as much as 500 cc of whole blood at one time Toward the end of the study, isotonic saline, plasma, and washed red blood cells were injected in a similar manner in some patients The rate of injection varied with each patient and appeared to be a factor in the causation of various symptoms Temperature and pulse rate were recorded carefully before injection, and afterward at hourly intervals for at least 12

From the Department of Obstetrics and Gynecology of Parkland Hospital and the Department of Obstetrics and Gynecology of the Southwestern Medical School of the University of Texas Dallas Texas hours White blood cell counts were made before injection, a few hours after injection, and on the following day Blood was injected prior to operation so that we could know for certain that it was in the peritoneal cavity and could study its fate, as well as possible peritoneal reaction In this series, in each of the 16 patients with a planned injection, the material was found within the peritoneal cavity In a patient not included in the series, 330 cc of whole blood supposedly injected intraperitoneally was totally lost The blood was not found in the peritoneal cavity and did not appear in the stools, and there was no parietal hematoma or any soft tissue mass anywhere

RESULTS

Naturally there were no definite end points, and evaluation of the experiments depended on the subjective observations and opinions of the observer and on the pain threshold and vocal response of the patient

Following injection of less than 300 cc of blood, the patient usually complained of fullness in the lower abdomen, and a desire to pass gas or belch Some patients complained of uterine cramping or said the afterpains were intensified Following injection of 300 to 550 cc of blood, moderate to severe pain immediately ensued, gradually diminished, and disappeared after 15 to 30 minutes However, if additional blood was injected, the pain recurred Even when patients were unaware that additional fluid was injected, pain and discomfort were produced This is one of the important findings of the study Moreover, with each succeeding injection, symptoms could be evoked with decreasing amounts of fluid and tended to persist for increasing periods of time Pain invariably disappeared within two hours after conclusion of injection However, a few patients, when questioned closely, admitted a feeling of fullness in the lower abdomen at this time Tenderness in response to deep palpation increased temporarily, but disappeared by the following morning This was true even in patients who at operation were discovered to have as much as 500 cc of bloody abdominal fluid

Most patients were operated on within 24 hours of the initial injections Approximately four-fifths of the injected blood was found remaining in the peritoneal cavity in each one It was always liquid, and clots were seldom found in the patients in whom whole blood had been injected

Five of the 16 patients received injections of materials other than whole blood Five hundred cubic centimeters of isotonic saline solution was injected into one patient The injection was begun rapidly, but, as with some of the other patients, was interrupted once or twice during its course Pain appeared after about 200 cc was injected Subsequently, the pain could be reproduced with diminishing amounts of saline When the abdomen was opened, there was merely a slight increase in the amount of intraperitoneal fluid In other words, practically all of the saline was absorbed during 24 hours This is entirely in accord with the experiments of Blackfan and Maxcy [1] reported in 1918

Plasma was absorbed rapidly, but not so rapidly as isotonic saline solution We employed Red Cross-prepared plasma In one patient receiving 100 cc, pain developed, and at operation some peritoneal reaction was exhibited A second patient received 475 cc of plasma, and was found to have approximately 75 cc of brownish fluid in the peritoneal cavity the next day It seemed to the observer that there was proportionately more peritoneal reaction with plasma than with similar quantities of blood in other patients However, this cannot be considered a valid observation since it was made on only one patient

Two patients received red blood cells washed and resuspended in Ringer's lactate solution In the patient receiving 260 cc, more than 100 cc of bloody fluid was found at operation In the patient receiving 520 cc, more than 300 cc was found at operation In other words, it would seem that because of the presence of the erythrocytes, rate of absorption of the Ringer's lactate solution was not so rapid as it might have been

Pain could be produced with each of these materials as well as with whole blood In other words, it would seem that the intensity of the pain reaction, in addition to depending on the pain threshold of the patient, is roughly proportional to the quantity of injected material, rather than dependent on the composition of injected material Experimental work by Capps and Coleman [2] in the human being suggests that localized pain results either from pressure on the parietal peritoneum with a stretching of the nerve endings in the subserosal layers, or from the tearing of the serosal cells with direct irritation to the subserosal nerve endings Also, Capps and Coleman believe that abdominal rigidity is the result of reflex action from the irritated parietal peritoneum, or of an inflamed viscus in contact with parietal peritoneum

Temperature elevations in excess of one degree Fahrenheit were not noted Following injection of a large amount of fluid, a mild leucocytosis, sometimes to 19,000 cells per cubic millimeter, resulted within four to six hours but disappeared by the next day At operation, the entire visible portion of the peritoneal surface was slightly injected, but no marked erythema or fibrin response was seen No patient suffered any abnormal after-effect because of the injection

REPORT OF TYPICAL PATIENTS

M E W was seven days postpartum After injection of 200 cc of whole blood she complained of epigastric pain She was placed in Trendelenburg position, but suffered no shoulder pain After her restoration to horizontal recumbency, an additional 60 cc of blood was injected, the epigastric pain recurred but was practically gone at the end of an hour At this time the patient complained of gas pains and stated that she felt better after passing gas Following injection, no pulse change was noted and the temperature rise was insignificant At the time of injection the white blood count was 12 800 per cubic millimeter It was 15 600 four hours after injection and 9 200 twelve hours later, or 16 hours postinjection During the night there was no difficulty, and at operation the next morning more than 200 cc of liquid blood was found in the peritoneal cavity

S M was four days postpartum Red blood cells removed from 500 cc of blood were washed and suspended in an equivalent amount of Ringer s lactate solution Two hundred and fifty cubic centimeters of this washed blood cell suspension was injected during the course of 15 minutes The patient complained of a feeling of fullness and a desire to defecate These symptoms decreased and after 15 minutes the injection was resumed with an additional 120 cc The discomfort reappeared, and actual pain was experienced for the first time Nevertheless, when she was placed with the head down in moderate Trendelenburg position and remained there for five minutes, there were no symptoms of diaphragmatic irritation After she had resumed the horizontal position, the injection was continued with another 75 cc At this time marked discomfort with moderate to severe abdominal pain appeared In other words, she had now received 445 cc over a period of 40 minutes Twenty minutes later another 55 cc of washed cells produced definite pain, which disappeared during the next 30 minutes At this time the symptoms were reproduced with 25 cc Not only were they reproduced, but the patient now had really severe pain (chiefly in the epigastrium), fulness, and tenderness on gentle palpation One and one half hours after conclusion of the injection the pain had decreased so that there was only a slight tenderness in response to palpation and a minimal subjective sensation of fulness Two hours after conclusion of the experiment the temperature was 98 6 F , the pulse, 80 beats per minute, and the white blood count, 19,000 per cubic millimeter Three hours after conclusion of the experiment the patient had no complaints and was out of bed and walking around the ward At this time the white blood count was 12,700, the temperature was 99 4 F , and the pulse varied between 80 and 90 beats per minute The following day more than 300 cc of bloody fluid was found in the peritoneal cavity and the peritoneum was slightly injected All conversation with the patient was through the medium of an interpreter, since the patient spoke no English It was felt at the time that suggestion of ideas, from physician to patient, was minimized

[1] Blackfan K D and Maxcy C F Intraperitoneal Injection of Saline Solution Am J Dis Child 15 19 28 (Jan) 1918

[2] Capps J A and Coleman G H Localization of the Pain Sense in the Parietal and Diaphragmatic Peritoneum Arch Int Med 30 778 789 (Dec) 1922

The following report is typical of a patient with accidental hemorrhage

C L , age 22, was in shock when first seen At this time she complained of no pain The abdomen was soft but there was moderate lower abdominal tenderness on deep palpation She was found to have a ruptured right interstitial tubal pregnancy and there was nearly 3 L of fluid blood with a few clots in the peritoneal cavity

Apparently the general dulling of sensations of the patient with shock makes the symptoms and signs of abdominal pain and palpatory tenderness totally unreliable as a means of ascertaining the presence or absence of blood in the peritoneal cavity Two other patients with massive accidental intraperitoneal hemorrhage exhibited similar symptoms, namely, absence of pain response and minimal tenderness on palpation Nevertheless, one of them had 1,200 cc of liquid blood in the peritoneal cavity, and the other, about 1,500 cc Many other patients with subsequently proved massive hemorrhage were observed All presented similar symptoms and signs, and their inclusion in this study would be unduly repetitious

COMMENT

Whole blood injected into the peritoneal cavity of experimental animals is harmless and produces almost no reaction [3] Single injections caused no adhesions or evidence of peritoneal irritation Massive coagulation did not occur, but there was slight microcoagulation On the other hand, when multiple injections over a period of time were used in the rabbit,[4] hyperplasia of the connective tissue cells of the omentum and increased monocytic cell response of the peritoneal fluid were produced

Frog erythrocytes injected into the peritoneal cavity of the white mouse [5] were absorbed intact, principally through the diaphragmatic lymphatics, although all of the peritoneal lymphatics are probably concerned with absorption Hahn and others [6] confirmed lymphatic absorption in the dog, using radioactivated iron incorporated in the erythrocytes Moreover, the red cells passed into the lymph spaces, vessels, and nodes without suffering injury or phagocytosis The absorption of red blood cells is augmented by acceleration of the rate and depth of respiration and by increased intra-abdominal pressure [7] However, the rate of absorption [6] varied in the dog from 20 to 100% in 24 hours

Cunningham [8] observed that 10% aqueous dextrose solution was absorbed primarily by way of the blood capillaries of the rat and postulated that this must be the route of absorption of the fluid portion of peritoneally injected blood

The therapeutic injection of blood into the human peritoneal cavity was performed as early as 1875 by Ponfick [9] Since then, many have employed the method in acute and chronic primary and secondary anemia More recently, Cole and Montgomery [10] injected 237 transfusions into the peritoneal cavities of 117 children On the other hand, no study was found directly relating to the subjective reactions produced by the experimental introduction of blood into the human peritoneal cavity

SUMMARY AND CONCLUSIONS

Sixteen women about to undergo laparotomy received injections of whole blood (11), saline (one), plasma (two) and washed red blood cells resuspended in Ringer's lactate solution (two) The records of three additional patients with accidental hemorrhage in excess of 1,200 cc were included in the study in order to indicate the effect of massive amounts of intraperitoneal blood

After injection of whole blood or resuspended erythrocytes, temperature elevation did not exceed one degree Fahrenheit There was usually a transient leucocytic response, but in no instance more than 19,000 cells per cubic millimeter By the day following injection there was usually a generalized peritoneal redness About four-fifths of the total quantity of injected blood remained in a liquid state in the abdominal cavity Clotting was invariably minimal

From work done by others, it is known that red blood cells are absorbed chiefly by the lymphatics of the diaphragm, while the fluid portion of the injected blood enters the circulation by way of the blood capillaries

Following injections of less than 300 cc of material, patients of this series complained of fullness in the abdominal cavity and a desire to belch and to pass gas Such patients seldom experience true pain When more than 300 cc was injected, moderate to severe abdominal pain, depending on the emotional threshold of the patient, appeared at once, but in every instance was gone within two hours On the other hand, tenderness in response to deep palpation sometimes persisted after this period of time After the initial injection, it was possible to bring back the abdominal pain by small additional amounts of injected material Translating this into clinical terms, it may be stated that in patients with suspected intra-abdominal hemorrhage, continuance of the complaint of fullness and pain indicates continuing or repeated hemorrhage The pain response of the patient depends on her emotional threshold, and apparently on the quantity and not the character of the injected material In three patients with massive accidental hemorrhage, the complaint of pain or fullness was conspicuously absent. Apparently the shock resulting from loss of quantities of blood into the peritoneal cavity dulls the sensorium, and therefore abolishes the reaction of pain

INACCURACY OF FOUR CHEMICAL PROCEDURES AS DIAGNOSTIC TESTS FOR CANCER

Richard J Henry, M D , Sam Berkman, Ph D , Beverly Hills, Calif , Marshall S Little, A B ,
and
Richard J Winzler, Ph D , Los Angeles

During the past several years, interest in the chemical serodiagnosis of cancer has been revived by the introduction of several new procedures Among these have been the methylene blue reduction time,[1] the heat turbidity index,[2] the Huggins iodoacetic acid index,[3] and the level of the mucoprotein fraction in blood [4] Although none of the originators of these tests claimed them to be specific for the diagnosis of malignant disease, the suggestion has been made that some of these tests would be a definite aid in cancer diagnosis The early evaluations of some of these tests indicated that they were fairly accurate More recent studies on two of these procedures, however, have been rather discouraging [5] It has been suggested that a battery of tests might prove to be more accurate than any one of its component parts It has been the purpose of this study to compare the accuracy of the above tests run simultaneously on the same patients and to determine whether a battery of the four tests would give greater accuracy than any single test

All patients were ambulatory and were referred for determination of suspected cancer or for therapy of an already diagnosed tumor It was felt that such a series would provide the most rigid indication of the value of the tests from the point of view of practical cancer diagnosis Both sexes and all age groups are represented In the majority of cases, final diagnosis was made by biopsy

Of 274 cases studied, there were 149 in which the diagnosis of cancer was ruled out, 77 in which the diagnosis of cancer was well established, and 48 in which there was doubt as to whether or not malignant disease was present at the time of the test Data for the latter group are not included in this report Many types of cancer were represented, including carcinoma of the breast, cervix, larynx, prostate, uterus, rectum and tongue, and malignant melanoma, basal cell carcinoma, and lymphosarcoma The determinations were made by persons having no knowledge of the case histories

METHODS

The blood samples were centrifuged within four hours of collection and the serum or plasma kept at refrigerator temperature (about 4 C) until analyzed The iodoacetic acid test was that of Huggins and his coworkers,[6] who used serum, the test being run within one week after the specimen was obtained The end-points were read by the wire-loop technique and, to minimize variations in their reading, all tests were read by the same person Total serum protein was determined by a biuret method [7]

The methylene blue reduction time was determined by the method of Black [1b] (with use of 0 15% methylene blue, and the addition of caprylic alcohol to decrease foaming [8]) The test was run on plasma within 24 hr after obtaining the specimen The heat turbidity index obtained was that of Black and his colleagues [2] and was run on plasma within 24 hr

The mucoprotein in serum or plasma was determined by the method of Winzler and others [9] within two weeks after the specimen was obtained, a period over which this fraction is stable

RESULTS

In the chart are bar graphs showing the distribution of results of the four tests for both groups, the values for individuals with cancer being shown by solid bars, and those for cancer-free patients, by open bars No attempt was made in this evaluation to separate the cancer-free but diseased from normal patients, since the primary concern of this project was to evaluate the procedures as diagnostic tests for cancer Actually, owing to the nature of the sources of test cases, very few "normal" cases were encountered As seen from the bar graphs, there is a great spread with considerable overlapping for both groups in each test, although there is an unmistakable tendency for a shift when the group with malignant disease is taken as a whole

The arbitrary values chosen to divide positive tests from negative ones were taken or estimated from the literature and were as follows an iodoacetic acid index less than 9 0 was positive, and greater than 9 0 was negative, a methylene blue reduction time of more than 10 min was positive, and of 10 min or less was negative, a heat turbidity index greater than 96 was positive, less than 96 was negative, a mucoprotein value greater than 4 5 was positive, less than 4 5 was negative

Two methods were used to evaluate the accuracy of the tests and of their combinations The first of these, shown in column six, is the "over-all per cent accuracy" calculated by averaging the per cent accuracy of the two groups, those with cancer and those without cancer The second method for expression of the data given in column seven is the Youden index or "J" value for the tests,[10] this value ranging from zero when there is no correlation of the test values with disease up to a value of unity when perfect correlation exists This index has been recently criticized [11] on the basis that it does not take into account the "critical value" chosen to divide positive tests from negative, and that different "J" values can be obtained merely by changing the "critical value" "J" values, therefore, must be regarded as valid only for the "critical value" used in the test—i e, the "critical value" chosen is considered part of the test. Inspection of the bar distribution graphs in the chart indicates that any increase in "J" values achieved by choosing different "critical values" could be only slight.

In the first four rows of Table 1 are given the results of the individual tests Since no sharp lines of demarcation between positive and negative tests could be drawn for these data it was believed advisable to establish "doubtful" zones for each test around the arbitrary points dividing positive from negative The zones arbitrarily chosen for these tests were as follows iodoacetic acid index, 8 6 to 9 4, methylene blue reduction time, 9 75 to 10 5 min, heat turbidity index, 90 to 100, and mucoprotein, 4 1 to 4 9 mg per 100 cc The correlation values for the four tests in which all values falling into these "doubtful" zones were discarded are given in rows five to eight, inclusive, of Table 1

In Table 2 are given the statistics on the four tests used as a battery In the first row are the results obtained when the battery is considered positive if at least one of the four tests is positive Thus, out of 70 patients with cancer, in 67 at least one of the four tests was positive, of 117 who were cancer-free, however, in 24 not even one test was positive Likewise, in the second row, the battery is positive if two or more are positive, and, in the last row, if any three of the four are positive Values falling in the "doubtful" zones were not discarded in these calculations

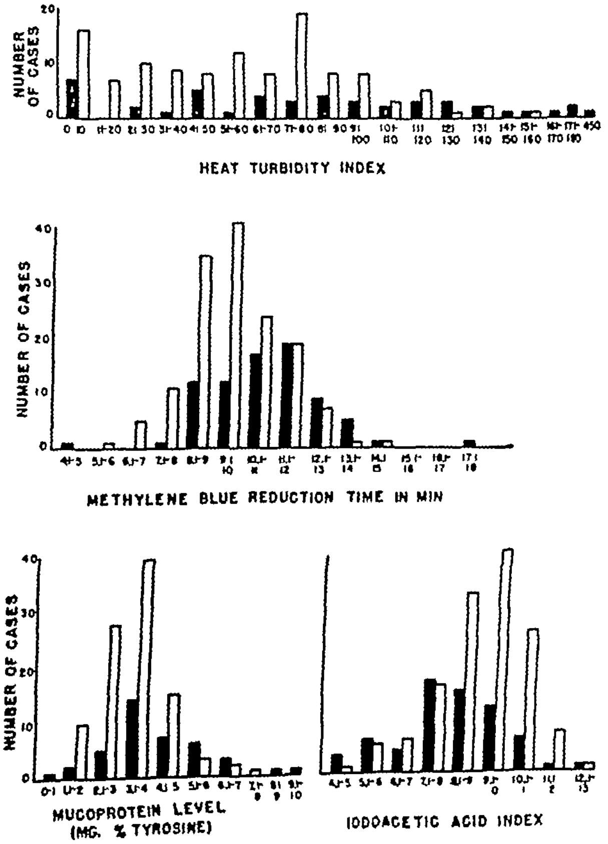

Chart showing distribution of test results among patients with cancer (solid bars) and without cancer (open bars)

The over-all per cent accuracy of the individual tests ranged from 61 to 69, and the "J" values lay between 0 2 and 0 4 The variation in the corresponding "J" values was not found to be statistically significant As was expected, the "J" values tended to show an increase with the introduction of the "doubtful" zones although the individual increases were not statistically significant If the battery of four tests was considered positive when one individual test or more was positive, it is seen that there

is a low percentage of false negatives but a high percentage of false positives If the battery was considered positive when three of the four tests were positive the situation was reversed, namely, a high percentage of false negatives and a low percentage of false positives When the battery was considered positive with a minimum of two tests positive, a balance between these two extremes was achieved, giving a higher over-all per cent accuracy and a significantly higher "J" value (significant by *t* test)[10] This "J" value is not, however, significantly higher than that of any of the individual tests employing the "doubtful" zones

It is possible that such chemical tests for cancer might be more accurate for one type than for another The only type of cancer sufficiently well represented in this series to warrant such an evaluation was that of carcinoma of the breast (20 cases) The iodoacetic acid index and the methylene blue reduction time were positive in 72 and 65% of the cases, respectively, in contrast to 69 and 66% for all types of cancer

COMMENT

As stated in the introduction, the early reports on these tests showed rather promising results Calculating "J" values from the published data, 0 857 was obtained for the iodoacetic acid index,[8] 0 765 and 0 552 for the methylene blue reduction time and heat turbidity index, respectively,[9] and 0 700 for the mucoprotein level[4] Later reports on the iodoacetic acid index yield "J" values of 0 161 and 0 233 [5b c] which compare closely to the value of 0 244 obtained in the series reported here It seems quite probable that the main cause for the apparent discrepancy between the earlier reports and the later ones, including the one presented here, is that the earlier ones dealt with patients hospitalized for cancer, who were therefore, on the average, further advanced, rather than ambulatory patients This point has already been emphasized by Bodansky and McInnes[5c] The "J" value of 0 700 for the plasma mucoprotein level calculated from the data of Winzler and Smyth[4] was in hospitalized cancer patients compared with normal individuals The mucoprotein determinations in the present series, yielding a "J" value of 0 211, were performed in the same laboratory and clearly demonstrate the degree to which the extent of the cancer and the presence of other illnesses may cause overlapping of groups

The accuracy of any one of the four tests reported on here is certainly not sufficient to warrant its classification as a diagnostic test for cancer When the four tests are run as a battery and interpreted as positive if a minimum of two tests is positive, the accuracy is somewhat improved but still cannot be regarded as a diagnostic procedure The idea of running a battery of such tests, however, has received some support here and deserves further consideration with other existing tests as well as with future tests

The ideal diagnostic test gives neither false positives nor false negatives In the statistical analysis used in this report both types of error are regarded as equally undesirable, although it is admitted that this is a debatable question

CONCLUSION

The evaluation of four potential blood tests for cancer, the iodoacetic acid index, the methylene blue reduction time, the heat turbidity index, and the mucoprotein level have been carried out on ambulatory individuals with cancer or with nonmalignant diseases Analysis of the results shows that these tests give correct results in only approximately 60 to 70% of the cases and thus cannot be regarded as accurate diagnostic tests for cancer When the four tests are run as a battery and interpreted as positive if a minimum of two individual tests is positive, the correlation is slightly improved but still cannot be regarded as a test diagnostic of malignant disease

CLINICAL NOTES

ALLERGY TO PITUITARY CORTICOTROPHIC HORMONE

Samuel M Feinberg, M D
Alan R Feinberg, M D
and
Edward Bigg, M D , Chicago

In view of the fact that the corticotrophic hormone (ACTH) is a protein, it is not surprising that hypersensitivity reactions to it would be encountered Our early work on the repeated use of corticotrophin to prevent anaphylactic reactions in guinea pigs sensitized to horse serum indicated that the animals were being sensitized to corticotrophin Our first experience with human sensitivity to corticotrophin is summarized in the following case report

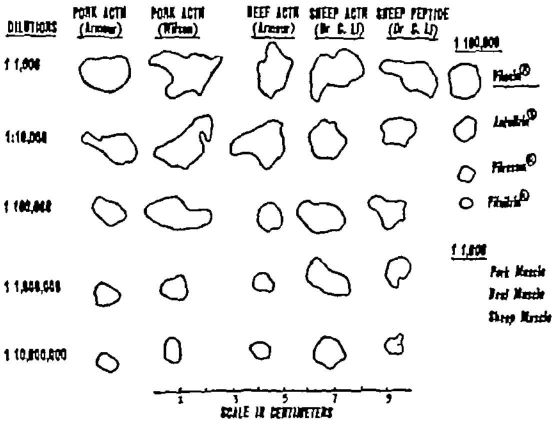
REPORT OF A CASE

F J , a woman, 60, was admitted to Passavant Memorial Hospital in August, 1950, under the service of one of us (E B) Her major complaint was a crippling rheumatoid arthritis of about 20-years' duration Cortisone was administered for 12 days, with some improvement in the arthritic symptoms Because the improvement was not considered adequate, a course of corticotrophin therapy was planned An injection of 25 mg of corticotrophin (Armour) was followed within five minutes by alarming symptoms, consisting of generalized urticaria and angioneurotic edema, probable edema of the larynx, signs of asthma, and profound shock After the injection of epinephrine and the use of additional measures, the patient recovered from this attack

Inquiry elicited the following pertinent information In the autumn of 1949 this patient had been treated at another hospital with corticotrophin The first injection produced a mild urticaria The injections were continued and the urticaria progressed On the 12th injection the reaction was severer and was associated with angioneurotic edema and shock The injections were then discontinued No history of previous injections of pituitary products could be elicited The personal or family history of allergy was not decisive

Preliminary skin tests made with corticotrophin (Armour) about two weeks after the last constitutional reaction indicated a high degree of allergy to this substance Subsequently, more complete studies were made These are summarized graphically in the Figure When corticotrophin solutions were injected intradermally in amounts of about 0 01 cc , whealing reactions were produced from dilutions as high as 1 10 million Use of another corticotrophin of pork origin [1] prepared by somewhat different methods produced identical results That this reactivity was not confined to the porcine corticotrophin was shown by the fact that use of beef corticotrophin [2] produced similar findings, and sheep corticotrophin [3] showed possibly even a greater reactivity This cross reactivity was not due to any generic relation between the animals in question, since 1 1,000 dilutions of extracts of pork, beef, and sheep muscle injected intradermally were completely nonreactive Of further interest is the fact that other pituitary preparations—anterior pituitary (antuitrin®), posterior pituitary (pituitrin®), vasopressin injection (pitressin®), and oxytocin injection (pitocin®)—also produced positive reactions It was thought possible that a peptide preparation of corticotrophin might be free from allergenic properties Use of a sheep corticotrophin peptide [3] also produced a high titer of skin reactivity The skin of a normal subject was injected in several sites with the patient's serum A positive passive transfer reaction was obtained to the porcine corticotrophin (Armour and Wilson) The other corticotrophin preparations produced false reactions in the 1 1,000 dilutions, while in higher dilutions no positive passive transfer test was obtainable No positive transfer to the other pituitary substances was demonstrable

The significance of allergy to corticotrophin is threefold First, it is of practical importance because it must be taken into consideration as a hazard in this type of therapy At the First Clinical ACTH Conference, several allergic reactions to this hormone were reported [4] At the Second Clinical ACTH Conference, December, 1950, Brown and Hollander [5] described the reactions in seven patients (out of a total of 212 treated) with allergy to corticotrophin In the discussion of that paper additional cases were cited by others



Tracings of the wheals produced by the intradermal injections of corticotrophin and other substances in the patient. Note that the end point had not yet been reached with 1 10 million dilutions of corticotrophin Attention is called to the entirely negative responses to tests with muscle extracts

Second, it is of interest that a substance which is presumed to improve allergic manifestations is capable of giving allergic reactions This seeming contradiction can be resolved when we realize that the action of corticotrophin is delayed and probably never adequate to prevent severe allergic reactions The fact that a 12-day therapy with cortisone did not sufficiently modify the allergic reaction to an allergenic substance like corticotrophin obviously indicates that we should not depend on such agents to provide complete prophylactic measures against allergy

Third, this case is of immunologic interest In some of the patients of Brown and Hollander, beef corticotrophin did not produce skin reactions and was tolerated clinically These were apparently examples of species specificity The nature of the other reactions was not definitely stated, but it may be assumed that they were organ or corticotrophin specific In our patient the specificity was related to corticotrophin or possibly to pituitary preparations in general Further work would have to be done to clarify this point It is interesting that our patient had an allergic reaction on the very first injection of corticotro-

phin This is not in accordance with accepted immunologic principles and would suggest that this patient had previously received pituitary substances

SUMMARY

An instance of severe allergic reaction to corticotrophin (ACTH) is described The patient was allergic to all forms of corticotrophin in high dilution as well as to other pituitary preparations The significance of the immunologic and clinical aspects of this subject is emphasized

DECUBITUS ULCER IN RHEUMATIC FEVER TREATED WITH CORTISONE

J Gordon Barrow, M D
and
Clayton R Sikes, M.D , Atlanta

The increasing availability of cortisone and pituitary adrenocorticotropic hormone (ACTH) to the medical profession merits careful consideration of possible complications resulting from the use of these potent agents The following case demonstrates the probable interference with normal wound-healing processes by cortisone

REPORT OF A CASE

M K., a Negro girl aged 13, was admitted to the medical service of Grady Memorial Hospital on Feb 12, 1950, with the chief complaints of joint pain and fever

Six weeks before admission she had noted a mild sore throat which lasted three to four days and then disappeared Ten days before admission she experienced the onset of migratory polyarthritis, fever, anorexia, and occasional episodes of sharp precordial pain She was confined to bed at home two days prior to admission and finally reported to the hospital because of increasing severity of joint pain

Physical examination on admission disclosed a fever of 102 F , and diffuse swelling, heat, and exquisite tenderness over several joints Cardiac examination revealed minimal enlargement, tachycardia, and apical protodiastolic gallop rhythm No murmurs or pericardial friction rub were heard Laboratory work revealed leukocytosis, and elevated sedimentation rate, but no evidence of the sickling phenomenon An electrocardiogram was interpreted to be consistent with acute pericarditis

The admission diagnosis was acute rheumatic polyarthritis and pancarditis, and the decision was made to treat her with cortisone This medication was begun two days after admission, in doses of 100 mg intramuscularly every 12 hr Pain and tenderness associated with the polyarthritis were severe and were not controlled in spite of as much as 60 mg of codeine by oral administration every four hours Salicylates were not given The slightest movement in bed caused extreme pain, and the patient voluntarily remained quiet and resisted any attempts to change her position Six days after admission a dime sized sacral decubitus ulcer surrounded by a small zone of necrotic skin was discovered Thereafter she was moved from one side to the other at frequent intervals in spite of marked joint pain, and she was never allowed to remain on her back The area of skin involved had never been the site of a cortisone injection

One week after admission and five days after cortisone had been started, her rheumatic symptoms and fever were much improved In another 48 hr all evidence of polyarthritis had completely disappeared, and her temperature was normal At this time the dose of cortisone was reduced to 50 mg intramuscularly every 12 hr

During the next week the patient felt quite well, and there was no return of rheumatic symptoms However, the decubitus enlarged rapidly in spite of the absence of significant gross infection and every effort to prevent weight bearing on the area involved At the end of the second week of cortisone therapy it became obvious that the enlarging decubitus was assuming more serious significance than the underlying rheumatic fever No fresh granulation tissue was apparent, and gross infection from which colon bacilli were cultured was present The diameter of the ulcer at the skin surface was 7 in (17 8 cm) and underlying tissues were involved down to the sacrum Because of the postulated depression of mesenchymal tissue formation by cortisone and experimental data concerning wound healing, cortisone was discontinued and systemic antibiotics were begun Five days later, adequate debridement was carried out, in addition to the measures which had been instituted when the decubitus was first discovered The latter included protection of surrounding skin, moist dressings, and local antibiotics Thereafter, healthy granulation tissue appeared, and normal healing progressed slowly but steadily

Nine days after cortisone was discontinued, polyarthritis and fever reappeared, but an uneventful remission was produced with salicylates

Total duration of hospitalization was four months, the last three of which were required for treatment of the decubitus At the time of discharge it was thought that her rheumatic carditis had subsided

COMMENT

Ragan and others [1] have demonstrated delayed healing in cortisone-treated rabbits, employing the techniques of surgical incision of the ear and experimental femur fracture Subsequent microscopic examination revealed absence of the normal healing mesenchymal tissue response Poor granulation tissue formation has also been noted in three patients while on pituitary adrenocorticotropic hormone therapy [2] One patient with dermatomyositis exhibited delay in the healing of a biopsy incision A second patient being treated for disseminated lupus erythematosus demonstrated failure of two abscess drainage incisions to heal while pituitary adrenocorticotropic hormone was continued and prompt appearance of healthy granulation tissue after it was discontinued In a third patient a decubitus ulcer developed, similar to the one reported here, while under treatment for lupus Again, the well-recognized weakness of supporting tissues in Cushing's syndrome is worth recalling

In this case the decubitus ulcer probably appeared because of pressure necrosis of the skin, secondary to severe polyarthritis and immobilization during the first five hospital days when cortisone was ineffective in alleviating the exquisite joint pain and tenderness Since the relief of joint pain in acute rheumatic fever by cortisone may require as long as four to seven days, in the future we shall use salicylates in addition to cortisone when the expected beneficial results from the latter are delayed as in this case It is believed that this case merits attention because of the rarity of decubiti in well-nourished young persons and the possible relationship to cortisone It seems unlikely that cortisone directly produced the lesion, but the early rapid increase in size in the relative absence of gross infection and the failure of granulations to appear in spite

---

National Heart Institute, United States Public Health Service Fellow in Cardiology (Dr Sikes)

From the Medical Service Grady Memorial Hospital and the Department of Medicine Emory University School of Medicine

Cortisone used in this case was purchased by the Georgia Heart Association as part of a grant for the study of rheumatic fever

[1] Ragan C and others The Effect of ACTH and Cortisone on Connective Tissue Bull New York Acad Med 26:251 1950

[2] Ragan C Grokoest A W and Boots R H Effect of Adrenocorticotrophic Hormone (ACTH) on Rheumatoid Arthritis Am J Med 7 741 1949

of heroic local measures were quite probably secondary to a cortisone inhibitory effect upon the normal wound-healing process

SUMMARY

A sacral decubitus ulcer developed soon after cortisone treatment was initiated in a case of acute rheumatic fever The rapid increase in size of the decubitus and failure of all local measures to induce healing were attributed to suppression of the normal wound-healing mechanism by cortisone Further use of this drug after the development of such a complication would seem inadvisable It is recommended that salicylates be used in addition to cortisone in the presence of severe polyarthritis

ACTIVE RHEUMATIC FEVER DURING PREGNANCY

William Horowitz, M D
Eugene Gersh, M D
and
Julius Burstein, M D , New York

Active rheumatic fever occurring during pregnancy is rare Hamilton and Thomson[1] found seven authentic cases of recurrent rheumatic fever in 781 pregnant women with chronic rheumatic heart disease This represented 700 patient-years of study These authors further state that they "made the diagnosis with more or less certainty only ten times in twenty years of extraordinary opportunity "

The following case is reported in order that experience in the management of this complication may be gained

REPORT OF CASE

H R , a Negro female, had had no significant illnesses until she was 14 years old, when there was pain in the left foot and ankle for approximately one week She was then apparently well until age 18, when she became ill, having a painful, swollen right wrist, and fever As the wrist improved the fingers and knees became painful but not swollen She was treated at home with acetylsalicylic acid and was well after three weeks No mention of heart involvement was made to her

Again she was well and able to work until age 21, at which time she entered Morrisania City Hospital with migratory polyarthritis, fever, a soft systolic murmur at the apex of the heart, and a coarse systolic murmur noted at Erb's point The sedimentation rate was 24 mm in 30 minutes P-R intervals varied from 0 22 to 0 24 sec and the QT complex was 0 434 sec The S T segments were slightly elevated in leads 1, 2, and CF_4 The initial blood pressure of 164/84 fell to 140/80 after bed rest Hemoglobin value was 65% red blood count 3,400,000, white blood cell count 23,000, with 82% polymorphonuclear cells and 18% lymphocytes She responded to salicylate therapy and was sent home after three months The final diagnosis was inactive rheumatic heart disease and mitral insufficiency Fluoroscopy was not done

At age 23 she had an uncomplicated pregnancy with spontaneous delivery of a normal girl, weighing 6 lb 5 oz (2 8 kg), after 13½ hours of labor Postpartum one observer noted systolic and presystolic apical murmurs The urine on two occasions showed albumin No electrocardiograms were taken

She was next hospitalized the following year, on Feb 13, 1949, because her right knee had been hot, painfully swollen and tender for 24 hours Her menstruation had previously been regular, and because she had missed her last two periods she believed she was pregnant (the last menses was on Nov 26, 1948) Two weeks previously cardiac fluoroscopy, performed in the outpatient department, revealed enlargement of the left auricle, and of the inflow and outflow tracts of the left and right ventricles The electrocardiogram at that time gave a rate of 92 per minute, P-R interval 0 24 sec , and the QT complex 0 496 sec

The patient was a markedly obese, normally developed Negro woman, 24 years old, not too distressed except for pain around her right knee joint which was hot, swollen, tender, and reddened Her temperature was 101 F , pulse regular at 110 per minute, and respirations 26 per minute Blood pressure was 130/70 There was no dyspnea, cyanosis, clubbing of fingers or toes, or peripheral edema The neck veins were not distended No skin nodules, rash, or enlarged lymph nodes were observed The lungs were clear The liver edge was not palpable The heart was not enlarged to percussion, the point of maximal impulse was in the sixth left interspace within the midclavicular line Sounds were rapid, rate 110 per minute, regular, and of good muscular quality No thrills were felt Mitral first sound was not accentuated A harsh apical systolic murmur was transmitted to the aortic area P_2 was greater than A_2 Pelvic examination was omitted Hemoglobin value was 70%, white blood count was 13,500, with 78% polymorphonuclear cells and 22% lymphocytes Sedimentation rate was 30 mm in 30 min Repeated blood cultures were normal, as was the serologic study Electrocardiogram showed a sinus tachycardia, rate 120 per minute, P-R interval 0 26 sec , and QT complex 0 460 sec Urinalysis revealed no abnormality The Aschheim Zondek test (for pregnancy) was positive

The second day after admission the left knee and both ankles became swollen and tender She was treated with acetylsalicylic acid, 8 gm (120 grains) daily in divided doses Within 24 hours all signs and symptoms referable to the joints had disappeared She remained comfortable although tachycardia of 100 to 120 per minute and a low grade fever (100 F) persisted Digitalis leaf, one cat unit daily, had been given from admission until March 10 Salicylates had been stopped on March 4 Occasional extra systoles of ventricular origin were noted P R interval continued at 0 26 sec and a second stage conduction block was manifest in the electrocardiogram of March 7 Opinion was divided regarding interruption of pregnancy, and thus the patient continued the second trimester

Suddenly, on March 18, the 33rd hospital day, the temperature rose to 103 F and the pulse was regular at 160 per minute The patient was extremely apprehensive, dyspneic, sweating profusely, and coughing pink, frothy sputum Blood pressure was 186/86 Medium moist rales were present at both lung bases The electrocardiogram revealed a sinus tachycardia, rate 150 per minute, the P waves were buried in the T waves, and the QT complex was 0 569 sec She was treated with oxygen, morphine, mercurial diuretics, and penicillin At this time the clinical impression was either acute left ventricular failure, pulmonary embolus, or bronchopneumonia

Next day the temperature remained at 103 F , pulse 144 per minute, regular, blood pressure 130/80 The basal rales had cleared The neck veins were not distended The heart sounds were muffled at the apex The liver edge was not palpable There was no evident phlebitis, calf tenderness, or Homan's sign By the following day the temperature dropped to 100 F and the patient both felt and looked better After two days oxygen and penicillin were discontinued However, the signs of rheumatic activity persisted the temperature near 100 F , elevated sedimentation rate (24 mm in 30 min), increased P-R interval (0 26 sec), and tachycardia of 100 per minute Again staff opinion was divided on interruption of pregnancy, so the patient was allowed to proceed to term

During the latter part of March systolic and diastolic murmurs were heard at the base in addition to the apical systolic murmur previously present Blood pressure was 180/50 It was believed that aortic insufficiency could now be diagnosed definitely Since rales were heard occasionally at the lung bases on

From the Prenatal Cardiac Clinic (Dr Horowitz, Chief) and the Department of Electrocardiography (Dr Burstein Director) Morrisania City Hospital

[1] Hamilton B E and Thomson K J The Heart in Pregnancy and the Childbearing Age Boston Little Brown & Company 1941

March 30, the patient was started on digitoxin and digitalized during the next three days She was maintained on 0 1 mg daily thereafter

She felt so much better on this regimen that she asked to return home She was therefore placed under the supervision of the Home Care Department on May 3, her 79th hospital day, and was visited by a medical resident physician each week On May 18, she was brought to the hospital for an electrocardiogram which showed a rate of 120 per minute, P R interval 0 20 sec, QT complex 0 465 sec, diphasic T in leads 1, 2, and CF$_4$, and depressed S T segments in leads 1 and 2 The sedimentation rate was 30 mm in 15 min

The following day she was markedly orthopneic and showed edema about the ankles Numerous moist wheezes were present The liver was tender to palpation and was found 3 fingerbreadths below the right costal margin On direct questioning the patient admitted that she had not taken any digitalis after her discharge from the hospital 16 days previously She was immediately given digitoxin and meralluride (mercuhydrin®), and kept at bed rest, and once again she responded

Spontaneous rupture of the membranes occurred on May 21 She was again hospitalized, continued on digitoxin 0 2 mg daily, and 2 cc. of meralluride twice weekly She was quite comfortable on bed rest, all signs of failure cleared Electrocardiogram on June 1 revealed a rate of 100 per minute, P-R interval 0 24 sec, and QT complex 0 460 sec The obstetric consultant stated that interruption of pregnancy was not warranted at this time

She was permitted to return to the home care service on June 3, and remained on complete bed rest with digitoxin and mercurials, as before, with no signs of failure About 8 a m on June 28 spontaneous labor began, this was about the seventh month of pregnancy Because of an outbreak of diarrhea in the nursery, the patient was transferred to another city hospital for delivery

Within several hours the patient became markedly orthopneic and apprehensive Her temperature rose to 101 F, pulse to 160 per minute (regular), respirations to 60 per minute, and the blood pressure to 240/70 Rales were present at both lung bases, the neck veins were distended, the liver edge was down 2 fingerbreadths, and the ankles were edematous The heart was enlarged both to left and right mitral systolic and diastolic and aortic diastolic murmurs were audible

She was treated with continuous oxygen by mask, morphine, intravenous mercurial injections, and 1 6 mg lanatoside C ("cedilanid) intramuscularly Her condition deteriorated steadily By 7 30 p m the cervix was completely dilated She was given a saddle block anesthesia and was easily delivered by low forceps of an apparently normal 3 lb (1 3 kg) male infant During the procedure she was given oxygen continuously and kept in high Fowler's position She seemed to improve for a short time after delivery, but despite therapy her failure increased and she died at 5 35 a m, 10 hours and five minutes after delivery Gradual respiratory embarrassment developed in the infant and he died 13 hours and 15 min after birth

Permission for post mortem examination was not obtained

COMMENT

The presence of active rheumatic carditis in pregnancy poses problems to both the internist and obstetrician First, the diagnosis of activity must be established, and second, a course of action must be determined During pregnancy it may be especially difficult to decide on the presence of activity, and, since this complication occurs so rarely, sufficient experience has not been accumulated to establish criteria for its management[2]

It should be emphasized that during a normal pregnancy new systolic murmurs may appear as well as a low grade fever, leukocytosis, elevated sedimentation rate, and vague joint pains Diseases such as sickle cell anemia, lupus erythematosis, and rheumatoid arthritis, must be differentiated In order to make a definite diagnosis of acute rheumatic fever, Jones[3] requires the presence of at least one major and two minor criteria Sokolow and Snell[4] state "the diagnosis of carditis, has depended largely on significant transient electrocardiographic changes, particularly partial auriculo-ventricular block and inverted T waves in Leads 1, 2, and 4, alone or in combination Other objective evidences of carditis have been less frequently observed " Taran[5] believes that electrocardiographic changes are most sensitive indicators of rheumatic activity Pardee[6] notes that sometimes in the electrocardiogram only was there any sign of rheumatic activity to be found

The question of the invariable presence of carditis in every case of acute rheumatic fever remains Sheehan and and Sutherland[7] believe that in any pregnant chronic rheumatic cardiac patient recurrent endocarditis may develop without any recognizable exciting cause other than the pregnancy itself In none of their cases were Aschoff bodies found, but this in itself does not exclude a diagnosis of rheumatic carditis[8] McKeown[9] describes the findings in six pregnant rheumatic cardiac patients with mitral stenosis who died in congestive failure Of these, four had rheumatic vegetations and Aschoff bodies of recent development in the myocardium One patient had the pregnancy itself In none of their cases were Aschoff nodules In only one was there complete absence of any evidence of recent rheumatic carditis

Active rheumatic fever lingers a variable length of time under present medical management The use of corticotrophin (ACTH) or cortisone gives promise of stopping the rheumatic infection[10] Until these substances become more generally available, the presence of a smouldering rheumatic carditis plus the load of pregnancy weights the balance toward congestive failure and possibly death

Cohen and Thomson,[11] and more recently Hamilton,[12] and Palmer and Walker[13] have shown by means of cardiac catheterization studies that the cardiac output in normal pregnant women increases gradually from the

10th week A maximum level, about 26% above the nonpregnant state, is reached between the 26th and 29th weeks, after which there is a slight fall From the 38th week there is a marked fall in cardiac output almost to nonpregnant levels which continues through the puerperium[12]

Therefore, if a pregnancy is to be interrupted for cardiac reasons, this must be done as early as possible before the sixth lunar month Until the third lunar month this may be accomplished by a dilatation and curettage Afterward an abdominal hysterotomy must be performed Unless there are compelling obstetric indications, interruption should not be attempted after the sixth lunar month The cardiac load is reaching its maximum[14] The additional strain of an abdominal operation on the overburdened heart may cause failure and death Furthermore, toward term the cardiac burden of pregnancy falls markedly[12]

In the patient discussed here, three definite episodes of acute rheumatic fever occurred before the final pregnancy In the second month of pregnancy, two weeks before hospitalization, the electrocardiographic demonstration of an increased P-R interval, 0 24 sec, and a QT complex of 0 496 sec indicated another episode of active carditis which waxed and waned throughout the pregnancy and ended in the death of mother and infant Interruption in the first trimester was withheld because she seemed to improve Unfortunately, during the early part of the second trimester she went into congestive failure but passed the sixth lunar month before interruption was again feasible She went into spontaneous labor during the seventh month while the cardiac burden was at its maximum Death of the mother and infant followed within the first day postpartum

Thus, in the presence of active carditis, early interruption of the pregnancy might have saved the life of the patient The rheumatic fever would have been treated in the usual manner and, statistically, her chances for recovery from the acute carditis would have been excellent[15]

SUMMARY AND CONCLUSIONS

A case of active recurrent rheumatic fever with carditis beginning before the second month of pregnancy, and ending in the death of both mother and infant during the seventh month, is described

From a study of the pertinent literature and our experience with this patient we believe that when active rheumatic carditis is diagnosed pregnancy should be terminated as early as possible before the sixth lunar month Since the cardiac burden of pregnancy reaches its maximum after this time, interruption by an abdominal operation imposes an additional load which may cause failure and death In the last trimester the patient should be permitted to go to term, unless obstetric complications supervene, in the expectation that the physiological decrease in the cardiac load after the 38th week of gestation will change the prognosis

THROMBOCYTOPENIC PURPURA IN PREGNANCY

Louis J Glick, M D
and
Nelson J Weiser, M D, New York

In 1948 Barnes and Doan[1] found only six authenticated cases in the literature of thrombocytopenic purpura complicating pregnancy in which splenectomy was done, to this series they added two cases of their own In the literature there is still uncertainty regarding the influence of pregnancy on the indications for splenectomy, and our purpose in presenting a ninth case is to attempt to assist in resolving this problem

REPORT OF A CASE

B D, a 24-yr-old Negro woman, had a history, which dated back to early childhood, of easy bruising and of prolonged bleeding following injury Two years prior to admission she had bled profusely after a tooth extraction, and 18 mo prior to admission she had had a prolonged and profuse menstrual period diagnosed by a clinic physician in another hospital as a spontaneous abortion, however, her menses immediately prior to this episode had been regular, and the physician had made no pelvic examination or performed a curettage

She was seen in the third month of her second pregnancy, the first had gone uneventfully to term five years before, and the child is living and well except for bronchial asthma

At the first examination her hemoglobin content was 7 gm per 100 cc, and, despite therapy with iron for three months, it never rose above 8 gm per 100 cc Throughout her pregnancy her gums bled easily when she brushed her teeth, and in the sixth month of her pregnancy a generalized petechial eruption developed

Physical examination findings were normal at this time, except for those incident to her pregnancy and evidence of bleeding at the sites mentioned The spleen was not felt Laboratory findings included a bleeding time of seven minutes, normal clotting time, 90,000 platelets per cubic millimeter of blood, and a normochromic anemia with a hemoglobin content of 8 gm per 100 cc The percentage of reticulocytes, the prothrombin level, and the white cell count and differential count were normal There was no clot retraction in 24 hr

The patient deteriorated rapidly, both from a hematologic and clinical standpoint The platelet count fell progressively to 5,000 per cubic millimeter of blood Protamine sulfate was given intravenously because of the finding of increased heparin tolerance, but new petechiae appeared and a hemorrhage into the urinary tract developed Bone marrow aspiration showed all elements, including megakaryocytes, to be normal

The patient was given a transfusion and splenectomy was done Technical difficulty was encountered because of the large uterus, despite double ligation of the splenic pedicle, there was troublesome bleeding owing to the tearing of adhesions between the spleen and the parietal peritoneum

Postoperatively the rise in the platelet count was disappointing reaching a maximum of 50,000 per cubic millimeter of blood by the sixth postoperative day There was bloody drainage from the operative site The blood pressure was at shock level for two hours following the operation, and fetal heart sounds were not heard after this time

On the seventh postoperative day while still showing clinical evidence of active thrombocytopenic purpura, the patient was delivered of a stillborn macerated fetus with a blood loss of less than 150 cc from the placental site

During the following three days the patient became increasingly icteric and had daily hematemesis A presumptive diagnosis was made of splenic vein thrombosis On the 12th postoperative

---

From the Departments of Medicine and Obstetrics The Bronx Hospital.

[1] Barnes A C and Doan C A. Splenectomy in Pregnancy Its Hematologic Indications and Obstetric Management, Am. J Obst & Gynec 55: 864 (May) 1948

day the patient had a massive hematemesis, she died the following day in shock and semicoma, despite transfusions, oxygen, and other supportive therapy

COMMENT

Pregnancy complicating thrombocytopenic purpura may modify the therapeutic approach with regard to the liability, if any, of these patients to exsanguinate from the placental site, the liability to premature separation of the placenta, and the liability of the newborn infant to be thrombocytopenic, if the mother is in relapse at the time of delivery

At first glance it would appear obvious that a patient with hemorrhagic tendencies would be likely to hemorrhage severely from the placental site Several reports in the literature have supported this view, notably, those of Mosher [2] in 1923 and of Rushmore [3] in 1925 Mosher states, "Nearly all cases of purpura hemorrhagica which go to term end fatally at delivery or soon after labor from hemorrhage " The evidence presented, however, is not convincing The majority of the 44 cases presented are culled from the literature of the 19th century, and clear differentiation is not made between idiopathic thrombocytopenic purpura, symptomatic purpura, and hemorrhagic states associated with scurvy and pregnancy toxemia Eleven of the cases are abstracted, and the stated cause of death in nine of these is not hemorrhage from the placental site Rushmore also reports (in 1925) a high maternal mortality in cases collected from the literature, probably including many of those reported by Mosher two years earlier Case reports are not offered in support of his statements

On the other hand, there are those authors who feel that thrombocytopenic purpura, even in relapse at term, does not increase the liability to postpartum hemorrhage Barnes [4] observed that postpartum blood in normal patients does not clot spontaneously unless seeded by blood from a cervical or vaginal tear He collected postpartum blood in normals from the cervical os and found that it behaved like defibrinated blood He concluded that the cessation of uterine bleeding depends only to a minor degree on hematologic factors and to a much greater degree on the closing of uterine sinuses by muscular contraction This view has been supported clinically by McGoldrick and Lapp,[5] who collected from the literature 76 cases of leukemia in pregnancy Of these only three died of postpartum hemorrhage, and two of the three had adequate obstetrical causes to explain the bleeding Burnett and Klass [6] in 1943 found in the literature only four authenticated cases of thrombocytopenic purpura in pregnancy, they added a fifth of their own Of the five cases, two delivered while in spontaneous remission, one delivered without excessive blood loss, although in relapse at the time and bleeding excessively from other sites, one had splenectomy intrapartum with remission, and one died of postpartum hemorrhage Polowe [7] did a splenectomy intrapartum with remission, the patient went normally to term Finn [8] delivered two previously splenectomized patients in relapse, neither bled excessively

It is difficult to assess the incidence of placental separation in these cases, since the only large series reported are those which had not received diagnosis that was sufficiently critical

It appears established that infants of thrombocytopenic mothers in relapse at the time of delivery may be themselves thrombocytopenic Finn [8] reported a thrombocytopenic infant in one of his two cases, Burnett and Klass [6] reported a case of hemorrhagic disease in the infant, although blood studies were not done, and Wintrobe [9] reported an additional case

In summary, a case has been presented of a woman with typical thrombocytopenic purpura who failed to respond clinically or hematologically to splenectomy in the course of pregnancy Nevertheless, she was delivered of a stillborn fetus a few days postoperatively without excessive blood loss This is in conformity with one school of thought found in the literature As a postmortem was not permitted, we only can speculate that this patient's failure to respond may have been caused by the presence of an accessory spleen

We feel that patients with thrombocytopenic purpura in pregnancy should be evaluated for splenectomy according to the usual indications and contraindications and without reference to the presence of the fetus

Dr Isadore Rothstein and Dr Ira Miller, of the Department of Pathology, assisted in the hematologic studies

HOMOTRANSPLANTATION OF THE KIDNEY IN THE HUMAN

SUPPLEMENTAL REPORT OF A CASE

Richard H Lawler, M D
James W West, M.D
Patrick H McNulty, M D
Edward J Clancy, M D
and
Raymond P Murphy, M D , Chicago

Successful homotransplantation of human tissue is a subject of great interest to the medical profession Because widely diversified and conflicting theories still exist as to the efficacy of this procedure (since most of the important experimental work has been done on laboratory animals and the results may not always be similar in man), and inasmuch as these conflicting views have led to an attempt to evaluate homografting in man, this study was made

[9] Wintrobe M Clinical Hematology Lea & Febiger 1949 p 618

The preliminary report of this case appeared in THE JOURNAL, Nov 4, 1950 [1] Therein it was reported that the operation took place on June 17, 1950 At that time a kidney from a woman of approximately the same age, blood type, and Rh type as the patient was transplanted to the renal pedicle of the patient after the removal of a polycystic left kidney An end-to-end anastomosis of the renal vessels and ureter around a catheter was done, and the blood supply to the grafted kidney was noted to be re-established The postoperative course was essentially uneventful, and by the third postoperative day the urinary output was observed to exceed total fluid intake by 1,750 cc , this urinary output diminished to the normal level in relation to total intake by the 14th postoperative day Experimentally, it has been shown that transplanted kidneys sometimes excrete more than twice the amount secreted by normal kidneys for a short time following *transplantation* [2]

SUPPLEMENTAL REPORT OF A CASE

On the 52nd postoperative day indigo carmine dye was observed to emerge from both ureters following parenteral injection Ten days later (the 62nd postoperative day) a retrograde injection of contrast medium on the grafted side revealed an incomplete stricture of the ureter A small amount of the dye was observed by x ray to pass upward beyond the site of the obstructive stricture On the 63rd postoperative day an exploratory operation through the original flank incision showed the kidney to be normal in size and consistency It was living, and the blood supply from the renal vessels was present Repair of the ureteral stricture was deferred because of the presence next to the kidney of a small abscess 3 by 3 cm , which was probably due to fat necrosis and did not involve the homograft This abscess was drained and the wound was closed in 10 days

The general health of the patient continued to be excellent, *results of her blood chemistry studies and urinary output being* within the normal range (nonprotein nitrogen of Jan 25, 1951 was 35 mg per 100 cc) It is believed by us that the progressive ureteral stricture gradually greatly diminished the urinary output

On April 1, 1951, the patient was again operated on through the original incision The homograft had diminished in size from that of a normal kidney to approximately 4 by 3 by 2 cm The ureteral and pelvic structures were absent, but the sutures disclosed the site of the original ureteral anastomosis The blood supply was still present The tissue itself was not enveloped in fibrous tissue, it was brownish red, similar in color to normal kidney tissue, and still definitely alive but apparently not producing urine

The reports of Servelle and others [3] in Paris in THE JOURNAL, May 26, 1951, reveal three cases, in each of which kidney function has been observed following homotransplantation to the iliac vessels with a cutaneous ureterostomy

One of us has had personal communication with Drs Kuss and Tienturier [4] at the Hospital of Paris, who state that they have completed 16 kidney homotransplants, using cutaneous ureterostomy, and that several of their homografts have functioned for several months and are still functioning

In the experimental laboratory we have used the splenic pedicle as the site of renal autotransplantation, employing cutaneous ureterostomy, with good results

ACUTE STAPHYLOCOCCIC ENDOCARDITIS CURED WITH THE AID OF BACITRACIN

Charles K Friedberg, M D
and
Mortimer E Bader, M D , New York

The accompanying case of staphylococcic endocarditis is reported because it is the first instance in which recovery from this disease may be credited largely, if not entirely, to the use of bacitracin Although the recovery rate from subacute bacterial endocarditis is very high if appropriate antibiotic therapy is instituted within a few weeks after onset, the outlook in cases of acute bacterial endocarditis, including those of staphylococcic endocarditis, is still very poor Only five of the patients in the 25 cases of Staphylococcus aureus endocarditis collected by Wilhelm and others [1] recovered after penicillin therapy, and only three patients in the nine cases studied by Levinson and others [2] recovered after treatment with penicillin and aureomycin The cure in the case presented here merits particular attention because the clinical manifestations were extremely severe and control of the infection had not been attained despite two weeks of treatment with massive doses of penicillin, aureomycin, and chloramphenicol

It is important to call attention to the usefulness of this additional antibiotic, bacitracin, in the control of staphylococcic endocarditis because in some, or many, cases the causative organism may be more sensitive to bacitracin than to penicillin or other available antibiotics Recent reports indicate that more than 50% of the strains of Staph aureus isolated are now resistant to penicillin [3]

Finally, some interesting observations will be noted as to the nature of a urinary abnormality that occurred in the course of parenteral bacitracin therapy

REPORT OF A CASE

A 28-yr -old diamond cutter was admitted to Mount Sinai Hospital for the first time on May 30, 1950 with a chief complaint of chills and fever of 10 days duration Since his childhood the patient, who had no history of rheumatic fever, had been regarded as a 'cardiac," had attended special classes in school,

and had been deferred from military service For five years he had occasional episodes of palpitation, and two years prior to admission he was digitalized and placed on maintenance doses of this drug.

Two weeks prior to admission the patient became listless and three days later experienced chills and fever with the temperature rising as high as 106 8 F At the onset of his illness he was treated with penicillin for three days with no apparent effect, he was therefore admitted to a hospital where three cultures of blood and agglutination tests for Salmonella and Brucella organisms were taken and reported negative A diagnosis of subacute bacterial endocarditis seemed probable despite the negative cultures He was treated with 4 gm of aureomycin daily with an unsatisfactory response Therapy was therefore changed to the daily administration of 5 million units of procaine penicillin combined with 2 gm of streptomycin parenterally and 4 gm of chloramphenicol for five additional days Despite this combined antibiotic therapy, the patient continued to have a high spiking temperature Petechiae were observed in the eye grounds, and tender spots appeared in the fingers and toes The patient experienced a sharp attack of pain in the left upper quadrant of the abdomen after the 12 days of therapy described above

Examination Findings—On admission to Mount Sinai Hospital the patient was obviously acutely ill The temperature ranged daily between 100 F and 106 F The blood pressure was 132/74 The heart was enlarged almost to the anterior axillary line with the point of maximum impulse in the sixth interspace just within the anterior axillary line The rhythm was grossly irregular due to auricular fibrillation There was a grade III apical systolic murmur, harsh, loud, and well transmitted to the axilla A soft apical diastolic rumble was also audible at the apex The liver was enlarged 4 cm below the right costal margin, smooth, and nontender The spleen was palpable There was minimal clubbing of the fingers, and on the left thumb there was a small, nontender, erythematous patch 3 mm in diameter Scattered, tiny, reddish macules were noted on the small toe of the right foot There was no abnormality in the lungs

Laboratory Data—The urine was alkaline, its specific gravity was 1 026 There was a trace of albumin The sediment revealed six to eight white cells, four to six red cells, and many granular casts The hemoglobin content was 11 9 gm The red blood cell count was 3,950,000 The white blood cell count was 20,200, of which 59% were segmented neutrophils, 36% band forms, 2% lymphocytes, and 3% monocytes The electrocardiogram showed auricular fibrillation, left axis deviation, and a low T wave in lead 1 The blood urea nitrogen was 18 mg., the fasting blood sugar 80 mg., the serum bilirubin 0 4 mg, and the serum cholesterol 131 mg per 100 cc The erythrocyte sedimentation rate was 26 mm per hour (Westergren) The cephalin flocculation reaction was 2 + The sternal marrow was very cellular and showed no significant abnormality

Course—Within eight hours after admission the patient had a shaking chill, and his temperature mounted to 106 8 F A culture of blood drawn at this point yielded 26 colonies of Staph aureus A a cubic centimeter It was now apparent from the clinical course and the causative organism that the patient was suffering from acute, not subacute, bacterial endocarditis Since the portal of entry of the causative organism is usually more apparent in acute bacterial endocarditis than in the subacute form and since the Staphylococcus is often introduced through an infection of the skin, the patient was reexamined with these facts in mind Tenderness and swelling were found to be present over the medial aspect of the right great toe Review of the history disclosed that there had been a purulent infection at this site and that it had been grossly manipulated immediately preceding the onset of the present illness On May 31, the day after admission, the patient received 4 million units of crystalline penicillin, and on June 1 the dose was increased to 3 million units every three hours (24 million units daily) and 1 gm of aureomycin every four hours After three days of this regimen the temperature still rose to 104 F The clinical appearance improved slightly at first but then grew rapidly worse On June 3, the fourth hospital day, a positive blood culture of Staphylococcus was again obtained, but only in one flask Because two weeks had now elapsed since the onset of the disease without control of the infection despite the use of penicillin in huge doses alone and in combination with aureomycin and chloramphenicol in full dosage, and because of the well known speed at which acute bacterial endocarditis runs a fatal course, more vigorous antibiotic therapy or a modification in treatment appeared urgently indicated

A review of the sensitivity of the causative Staphylococcus (table 1) revealed that it was moderately resistant to penicillin in vitro, but the dosage administered was theoretically more than adequate to control the infection The microorganism was even more sensitive to aureomycin and chloramphenicol in vitro, but clinically aureomycin and chloramphenicol had proved ineffective The most potent antibiotic in vitro was bacitracin, which inhibited growth with half the concentration needed to inhibit the standard test organism Furthermore, the causative Staphylococcus was extremely sensitive to a combination of bacitracin and penicillin, much more so than to bacitracin or penicillin alone or to the combination of penicillin and aureomycin

TABLE 1—*Sensitivity of the Infecting Organism, Staph Aureus*

Antibiotic	Concentration, per Cc.	Index of Resistance (X Standard)
Penicillin	0.3 units	15 0
Aureomycin	0 4 γ	2.0
Terramycin	0.8 γ	8 0
Chloramphenicol	2 0 γ	3 8
Bacitracin	0 2 units	0.5
Penicillin Bacitracin	0 09 units 0 06 units	in combination
Penicillin Aureomycin	0 12 units 0 10 γ	in combination

Accordingly, bacitracin therapy was begun the evening of June 4, the fifth hospital day, with 10,000 units administered intramuscularly every four hours The bacitracin in combination with the penicillin and aureomycin produced a blood level of more than 40 units of penicillin activity and a bacitracin level of 17 units per cubic centimeter of serum (table 2) There followed a progressive decline in temperature, within two days the temperature did not exceed 101 F and thereafter fell over a week's time to levels between 99 F and 100 F With the abatement of fever there was a concomitant improvement in the remainder of the clinical course Except for one brief episode of tenderness of the left costovertebral angle on June 10, the embolic phenomena subsided

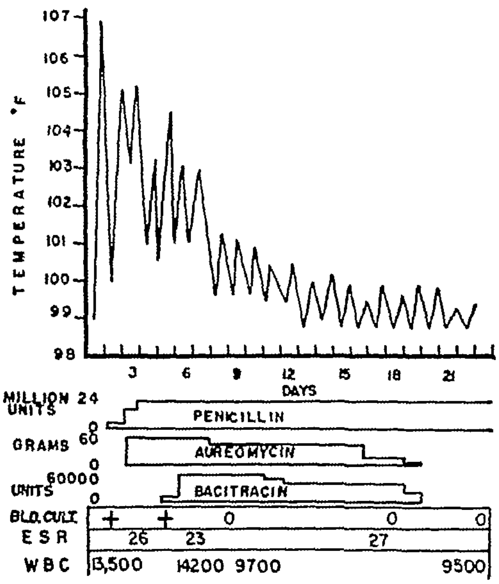
TABLE 2—*Antibacterial Activity of Serum After Antibiotic Administration*

Date	Antibiotic	Dosage Units	Antibiotic Level of Serum 3 Hours After Administration (Staph Aureus A Units per Cc)
6/2/50	Penicillin Aureomycin	3 million q 3 h 1 0 Gm q 4 h	Total 8
6/7/50	Penicillin Aureomycin Bacitracin	3 million q 3 h 1 0 Gm q 4 h 10 000 q 4 h	Total greater than 40 Bacitracin level 17 (bacitracin units per cc)
6/21/50	Penicillin	3 million q 3 h	20
6/20/50	Penicillin	3 million q 3 h	13
7/3/50	Penicillin	3 million q 3 h	13
7/11/50	Penicillin	3 million q 3 h	10

The patient tolerated the large doses of aureomycin poorly, suffering intense nausea and vomiting even before bacitracin was given The oral administration of aureomycin was therefore discontinued on June 14 and 900 mg of aureomycin a day was administered intravenously for two days and omitted thereafter

The bacitracin dosage was reduced to 40,000 units daily on June 9, the seventh day of its use, and after an additional seven and one half days it was discontinued A culture of blood drawn on June 17 showed no growth Penicillin was continued, the dosage being 24 million units a day, until June 19

The urinary findings were of particular interest The urine was studied daily and was consistently acid, with a specific gravity of 1 026 on admission and with random specimens consistently above 1 022, during the entire course of bacitracin therapy Subsequently, slightly lower values were found, but before the patient s discharge values of 1 024 were again noted Albuminuria was present only in faint traces There was no significant abnormality in the sediment Reducing tests for sugar were negative until June 17, the 14th day of bacitracin therapy, when a positive reaction equivalent to 1 + to a test for glucose was obtained Thereafter the urine was tested at frequent intervals revealing the same positive reaction At no time was acetonuria noted The fasting blood sugar was 80 mg per 100 cc, and an oral glucose tolerance test revealed a normal curve The blood urea nitrogen remained normal, and urine culture showed only Staphylococcus albus B The reducing substance in the urine was studied, and it was demonstrated that while the color of a copper solution was changed no copper oxide precipitated at room temperature There was no fermentation with yeast and tests for pentose were negative The reducing substance disappeared on July 19 One month later tests for this reducing substance failed to reveal its presence Previous workers[4] noted excretion of approximately 25% of the administered dose of bacitracin in the urine, with urinary concentrations not exceeding 50 units a cubic centimeter Because the bacitracin itself may have been responsible for the reducing reaction, tests for reducing properties were made with 200 units a cubic centimeter of bacitracin, as well as with lower concentrations In no instance was there a *positive reducing reaction*



Clinical course first 22 days at Mount Sinai Hospital First hospital day represents 13th day of illness Prior to this hospitalization large doses of penicillin streptomycin aureomycin and chloramphenicol had been administered without effect

The patient was discharged on July 24, 1950, after 56 days of hospitalization He was afebrile His heart murmurs were unchanged, and the spleen was no longer palpable The blood leukocyte and differential count were normal A mild anemia and an elevation of sedimentation rate were present The urine was normal except for a trace of albumin The blood urea nitrogen was normal Three daily consecutive cultures of blood taken after all antibiotic therapy was discontinued revealed no growth During his stay at Mount Sinai Hospital the patient had received a total of 660,000 units of bacitracin in 15 days, 1 billion 11 million units of penicillin in 44 days, and 66 gm orally and 2 1 gm intravenously of aureomycin in 17 days He has remained well up to the time of writing, five months after treatment was completed

COMMENT

The clinical differentiation between acute staphylococcic bacteremia without endocarditis and acute staphylococcic endocarditis is often difficult The chills and extremely high fever, the positive blood culture, and even the splenomegaly occur in either disease In this case the additional findings of rheumatic cardiovalvular disease, petechiae, an Osler node, and the absence of an active bacterial focus (other than valvular vegetations) which could maintain the bacteremia supported the diagnosis of acute bacterial endocarditis Since there was no striking change in the character of the murmur and no development of a new murmur, there is no direct evidence that bacterial vegetations actually involved the endocardium However, the diagnosis of bacterial endocarditis appears justified whenever a persistent bacteremia is found in the presence of a valvular lesion and in the absence of any other overt bacterial infection in direct contact with the blood stream

The knowledge that acute bacterial endocarditis usually runs its complete and fatal course within four weeks interdicted any prolonged periods of experimental therapy and impelled us to rapid modifications when a brief trial of a given regimen failed to give prompt evidence of control of the infection Furthermore, delay in appropriate therapy might court the risk of suppurative focuses in the brain or other organs that would be difficult to eradicate with doses of antibiotics which would have been effective earlier Since the temperature, after a slight fall, had risen to 104 F and the patient's clinical condition had not significantly improved, despite a week's treatment with at least 5 million units daily of penicillin and three days of treatment with 24 million units daily of penicillin together with the 4 to 6 gm daily of aureomycin and chloramphenicol given previously, further change in therapy was considered urgently indicated At this point bacitracin therapy was instituted, both because the other antibiotics had failed and because in vitro sensitivity studies indicated that bacitracin might be more effective For the reasons mentioned above and because bacitracin alone had not yet been found curative in cases of staphylococcic endocarditis, the penicillin and aureomycin were continued together with the bacitracin The in vitro studies had also indicated that penicillin and bacitracin in combination were much more effective against the causative Staphylococcus in this case than bacitracin alone

Because the other antibiotics were continued, it is difficult to assess accurately the relative importance of bacitracin in effecting recovery It was felt that the patient's condition was critical and had been deteriorating under penicillin and aureomycin therapy and that there was a striking and rapidly favorable clinical response to the addition of bacitracin therapy Credit for recovery may be given to the action of bacitracin on the basis of other objective data, namely, the persistent fever and positive blood culture on the day that bacitracin therapy was begun and the rapid lysis of fever and the negative blood cultures after the therapy was instituted Nevertheless, the possibility cannot be excluded that the penicillin alone or in combination with aureomycin might have eventually effected a cure since the temperature had been reaching lower levels (104 F) and the blood culture, although still positive, suggested that relatively fewer organisms were present in a unit of blood It is also uncertain whether the bacitracin alone would have been equally effective or whether the potentiating effect of combined penicillin and bacitracin was essential

[4] Zintel H A Ma R A Nichols A. C., and Ellis H The Absorption Distribution Excretion and Toxicity of Bacitracin in Man Am J M Sc 218:439 1949

With respect to staphylococcic infections in general and staphylococcic endocarditis in particular, the availability of bacitracin as an effective antibiotic is especially timely An increasing number of reports [3] indicate that more and more strains of staphylococci are becoming resistant to penicillin, hitherto the preferred antibiotic against staphylococci British workers [3a,d] have reported that as many as 60 to 70% of the strains of staphylococci isolated from hospital patients were resistant to penicillin Reports in this country also indicate that there has been a striking and sudden increase in the percentage of penicillin-resistant strains of staphylococci [3c,e] Penicillin resistance is apt to be of particularly serious consequence in cases of bacteremia or endocarditis Nichols and Needham [3c] reported from Mayo Clinic that in a series of 15 patients with bacteremia due to Staph aureus the organism was resistant to penicillin in 12 instances Similarly, Hirsh and associates [3b] isolated penicillin-resistant staphylococci in four cases of bacteremia or endocarditis The importance of establishing the efficacy of other antibiotics against these penicillin-resistant staphylococci is apparent Streptomycin may be effective in vitro, but resistance to this antibiotic develops during therapy [3c] Aureomycin has sometimes proved effective in generalized staphylococcal infections after penicillin has failed [5] but did not control the infection in our case or in a case described by Astler and Morgan [6] The development of resistance to aureomycin in cases of staphylococcic endocarditis was noted by Levinson and associates [2] The encouraging experience with bacitracin suggests that this antibiotic may supply a much needed additional effective agent against these serious staphylococcic bacteremias with and without endocarditis

There have been several reports on the nephrotoxic activity of bacitracin [7] By means of clearance techniques reduction in both glomerular and tubular function was demonstrated [7e] Proteinuria was a constant early finding but disappeared rapidly (in 16 days), whereas, the reduced glomerular and tubular function required seven to nine weeks for recovery [7e] It is uncertain whether the toxicity is due to impurities or to bacitracin itself The observation that toxicity was much more frequent in lots of bacitracin prepared by the deep tank method than by the surface method suggests that the toxicity may be due to impurities The gravity of the case presented here appeared to warrant the use of bacitracin despite reports of its nephrotoxicity No significant increase in proteinuria occurred, and, while the specific gravity of random specimens fell slightly, there was no significant reduction in concentrating power of the kidney Several authors have observed that "fasting glycosuria" has occurred under bacitracin therapy [7d,e] Positive reactions to reducing tests for glucose were obtained here also, but it was demonstrated that the reducing substance was neither glucose nor pentose The findings in this case indicate that while a reducing substance may appear in the urine of bacitracin-treated patients there is no glycosuria The nature of the reducing substance was not identified Bacitracin itself is not a reducing substance in concentrations up to 200 units a cubic centimeter

No significant toxic manifestations of a gastrointestinal nature or local reactions at the site of injection were noted

SUMMARY

This is a report of the first case of acute Staph aureus endocarditis in which cure followed the parenteral use of bacitracin in conjunction with other antibiotics The bacitracin appeared to be effective after the disease had not been controlled by huge doses, over a period of 12 days, of penicillin, aureomycin, and chloramphenicol No significant renal or other toxicity was associated with the administration of bacitracin A reducing substance, previously regarded as glucose, was also noted in this case during bacitracin therapy It was, however, demonstrated to be neither glucose nor pentose Because of the increasing frequency of penicillin-resistant strains of Staph aureus, the availability of bacitracin as another potent antibiotic in serious staphylococcic bacteremias and endocarditis is noteworthy

Dr Frank L Meleney supplied the bacitracin used in this case

1088 Park Ave (Dr Friedberg)

Schism in Psychiatry.—The psychiatric view of man has changed in half a century Fifty years ago, the psychiatrist was likely to see only the somatic man The general psychiatric quest was for central nervous system pathology to explain the various derangements The reaction which followed, placed emphasis on psyche rather than soma, on function rather than structure Here, however, even when there was great protestation that the psyche was a function of a somatopsychic entity, that all psychiatric disorders must be considered in relation to physical factors, constitution, or biological determinants, there was a tendency to discuss mental disorders as if the soma did not exist. Meyer was one of the few to raise a voice against this professional schizoid behavior, and Meyer was venerated rather than followed, while Freud, his pupils and the deviant psychoanalytic schools, who all emphasized verbally that they were convinced of important somatic factors, did little to establish or study them

It is questionable if shock treatment and the psychosurgical procedures have dipped the balance back toward a somatic orientation Psychosomatic medicine has thrown a bridge across the psychiatric gap but it has been too narrow to accommodate the full breadth of the concepts on either side It has given access to a new field, rather than helped in exploration of the fundamental relationships of psychic and somatic factors in the major psychiatric disorders Any full exploration will include, among many things, hormone relationships —'Brighten the Corner," an editorial in the *Psychiatric Quarterly*, April, 1951

COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

This paper is one of a series requested by the Council on National Emergency Medical Service to inform the medical profession on problems pertaining to civil defense. It does not necessarily reflect, however, the opinions of the Council or of any other official body unless so stated in the article.

C. JOSEPH STETLER, *Secretary*

ATOMIC BOMB INJURY: RADIATION

Charles L. Dunham, M.D.
Eugene P. Cronkite, M.D.
George V. Le Roy, M.D.
and
Shields Warren, M.D., Washington, D. C.

The syndrome of acute radiation injury to be considered in this article is the term applied to the symptom complex, or diseased state, which results from exposure of the whole body or a major portion of it to the initial nuclear radiation of an atomic bomb. This term should be clearly distinguished from irradiation sickness, which is commonly used to describe the symptom complex resulting from therapeutic irradiation. It should also be distinguished from surface radiation injury. This term is properly applied to injuries of the skin and subcutaneous tissues resulting from x-radiation or from contact or near contact with radioactive material, such as fission products and induced radioactivity. Injuries of this type related to atomic energy are due largely to beta-ray-emitting isotopes. Internal radiation injury may result from the selective deposition, such as in bone or thyroid, of radioactive material that has been inhaled or absorbed through the gastrointestinal tract or wounds. The two latter types of radiation injury may be caused by residual radioactive contamination.

Initial nuclear radiation from an atomic bomb consists of gamma rays and neutrons emitted during the first minute after atomic explosion. Approximately one-half of the initial nuclear radiation is delivered in the first second, and 98% has been delivered by the end of one minute. The syndrome of radiation injury due to exposure of the whole body may occur as a result of any sort of atomic explosion: air burst, surface burst, or underwater burst. In an air burst or a surface burst, persons who are in the open, unshielded by buildings or natural objects, will constitute the most exposed group for any given distance. Those who are shielded by natural objects or who are in buildings made of brick, concrete, or metal will be less exposed, and those who are in tunnels, caves, or air raid shelters will be the least exposed.

When the data of the Japanese casualties were analyzed, it was found that it was possible to evaluate, in a general way, the effect of shielding afforded by buildings and shelters. The symptoms and the results of radiation injury to persons who were inside buildings were equivalent to those observed in persons who were in the open, unshielded, and approximately 500 yards farther away from the bomb. It is evident from animal experiments that effective shielding of some portion of the body, such as the spleen, the head, or the abdomen, may reduce the mortality. Only those who were certainly in the open and unshielded, or were in wooden buildings, can be assumed to have received the maximum dose of initial nuclear radiation which could be expected at a given distance. It is proper to assume that all others have received less than the dose that is theoretically possible. It is apparent that it will not be desirable to classify casualties solely on the basis of their distance from the bomb burst.

CLINICAL CLASSIFICATION OF THE SYNDROME OF ACUTE RADIATION INJURY

On the basis of the study of the Japanese casualties, and by analogy with other forms of trauma, casualties may be divided roughly into two classes: (1) uncomplicated radiation injury and (2) radiation injury complicated by burns and wounds. It is not now known how important such complications may be, but it appears that the effect may be considerable. This paper will be limited to uncomplicated radiation injury.

The syndrome of acute radiation injury due to exposure of the whole body to the initial nuclear radiation of an atomic bomb was found to occur in three fairly distinct forms, the features of which are summarized in the following outline:

1. Very severe cases (in general, radiation exposure of 600 r or more)
    (*a*) First day
        Malaise, nausea and vomiting beginning one to two hours after exposure and continuing for several days
        Prostration
        Rapidly developing and persistent severe leukopenia
    (*b*) Next few days
        Diarrhea and rising sustained fever
    (*c*) Up to two weeks
        Death in coma and delirium within 14 days after exposure
        Purpura and epilation may appear shortly before death
2. Severe cases (in general, radiation exposure of about 400 r)
    (*a*) First day
        Nausea and vomiting usually occurring a few hours after exposure but rarely persisting more than 24 hours
    (*b*) Second day
        Lymphopenia (about 800 lymphocytes per cubic millimeter)
        Total leukocyte count variable
    (*c*) Fourth to 20th days
        First, a period of relative freedom from symptoms, with
            (1) Perhaps some malaise and easy fatigability
            (2) Persistent lymphopenia
            (3) Fluctuating leukopenia

The opinions and assertions contained herein are the personal ones of the authors and are not to be construed as official or as reflecting the views of the Department of the Navy, the Naval Service at large, or the Atomic Energy Commission.

Chief, Medical Branch, Division of Biology and Medicine, United States Atomic Energy Commission, Washington 25, D. C. (Dr. Dunham); Commander, Medical Corps, United States Navy, Naval Medical Research Institute, Bethesda 14, Md. (Dr. Cronkite); Assistant Professor of Medicine, Northwestern University Medical School, and Consultant, Division of Biology and Medicine, United States Atomic Energy Commission (Dr. Le Roy); Director, Division of Biology and Medicine, United States Atomic Energy Commission (Dr. Warren).

Then, at any time up to the 20th day, the individual may become seriously ill, showing any or all of the following symptoms
(1) Epilation (chiefly limited to scalp)
(2) Purpura and other hemorrhagic complications such as melena, epistaxis, menorrhagia and metrorrhagia
(3) Oropharyngeal ulcerations
(4) Diarrhea
(5) Fever
(6) Severe leukopenia
(7) Infection and breakdown of healing wounds
(8) General sepsis
(*d*) 20th to 40th days
Death occurs in 50% of untreated persons with sepsis or with hemorrhagic manifestations dominating the picture

3 Mild to moderately severe cases (in general, radiation exposure of 200 to 300 r)
(*a*) First day
Vomiting may occur a few hours after exposure
(*b*) Next two weeks
No definite symptoms
Moderate lymphopenia
(*c*) After two weeks
One or a few of the following may appear
(1) Epilation (chiefly limited to scalp)
(2) Malaise
(3) Sore throat
(4) Petechiae
(5) Diarrhea
(6) Weight loss

Very Severe Radiation Injury —In this form, vomiting commences shortly after the bombing and may persist for several days Progressive malaise leading to prostration begins shortly after the bombing, and symptoms continue unabated until death Diarrhea usually appears within a few days and persists Fever of the sustained type occurs within a few days of the bombing and increases progressively Without therapy, death is invariable and may occur at any time from a few hours up to 14 days Epilation and purpura may appear shortly before death Hemorrhagic manifestations do not seem to be responsible for the fatal outcome Progressive leukopenia is present from the day of the bombing

Severe Radiation Injury —In this form, vomiting occurs shortly after the bombing and seldom lasts longer than the first day A latent period follows, during which the only symptom is increasing malaise The end of the latent period occurs in four to 20 days and is marked by the appearance of one or all of the following characteristic symptoms of radiation injury epilation, purpura, other manifestations of the hemorrhagic state, and oropharyngeal lesions Concurrently, a variety of conditions may develop (diarrhea, infection and breakdown of healing wounds) The patient rapidly becomes very ill with fever, and prostration and a severe hemorrhagic state may occur If death follows, it is usually due to acute blood loss, septicemia, or hemorrhage into vital structures Death may occur at any time between the third and sixth week after the bombing The hematological findings in these patients are most pronounced during the third to the fifth week and consist of severe leukopenia, thrombopenia, anemia, and prolonged bleeding and clotting time As recovery occurs, the hemorrhagic manifestations subside and spontaneous defervescence takes place Among the Japanese, the mortality rate for patients with severe radiation injury varied from 25% to more than 50% It is convenient to consider that severe radiation injury in man is equivalent to the type of injury that occurs in experimental mammals given a comparable dose of x-rays

Mild to Moderately Severe Radiation Injury —In this form, any of the characteristic symptoms may occur, but it is distinctly unusual for all of them to be present The interval between exposure and the occurrence of the general symptoms is longer than in the preceding types The changes in the hemogram are less profound than in the severe forms, and they occur somewhat later in the course of the disease Recovery is the rule for better than 90% of patients with moderately severe radiation injury The deaths that occur are usually the result of complications, such as tuberculosis, bronchiectasis, chronic abscesses, and refractory anemia, and as a rule *occur later than the sixth week*

Since the number of persons exposed to an atomic bomb increases geometrically with the distance from the explosion, it follows that there will be more patients with the mild to moderately severe type of radiation injury than with the severe type The smallest group would ordinarily be the very severe cases Because of the large number of casualties produced by a single atomic explosion, it is of the utmost importance to estimate, as promptly as possible, the severity of the radiation injury experienced by each patient It is obviously uneconomical of medical supplies and medical personnel—and, in fact, unnecessary—to devote much attention to patients with moderately severe and mild radiation injury

In general, few who are farther than one mile from the site of an atomic bomb[1] explosion will experience the syndrome of severe radiation injury, regardless of whether they were shielded or outdoors Badly burned patients may be an exception to this rule, but they would require extensive medical care for their burns in any event On the basis of our present knowledge, it would appear that the syndrome of severe radiation injury, uncomplicated by burns or wounds, would develop in not more than 5% of those who received less than 200 r Regardless of whether the exact location of the person at the time of exposure is known, or whether personnel dosimeters are available, the severity of the radiation injury can be judged with fair accuracy, once the symptoms have developed, by an evaluation of the symptoms and the laboratory findings

CLINICAL DIAGNOSIS OF RADIATION INJURY

Analysis of the data collected by the Joint Commission for the Investigation of the Effects of the Atomic Bomb in Japan disclosed that in persons exposed to an atomic explosion, epilation and purpura could be designated specific symptoms of radiation injury Three other symptoms were designated suggestive symptoms of radiation injury vomiting on the day of the bombing, oropharyngeal lesions which occurred before the 39th day, and hemorrhagic manifestations other than cutaneous purpura A variety of other symptoms were subjected to statistical evaluation, such as anorexia, malaise, diarrhea, bloody diarrhea, and fever, but the degree of correlation was low

---

[1] The type of atomic bomb referred to is equivalent to 20 kilotons of trinitrotoluene (TNT)

Among the Japanese, epilation commenced during the second week after the bombing and was largely confined to the hair of the scalp The mean day of onset of epilation was the 25th Regrowth of hair was apparent after the sixth week in most surviving patients and was usually complete by the fourth or fifth month

Among the Japanese, purpura was of the cutaneous variety, such as would be readily apparent on inspection It was rarely observed before the third week, and the mean day of onset was the 24th In general, patients with cutaneous purpura which was extensive displayed other signs of the hemorrhagic state

These two symptoms, epilation and purpura, offer the best clinical indication of the severity of the exposure to radiation Patients with both these symptoms usually had the suggestive symptoms referred to above It was found that patients with both these symptoms had the lowest leukocyte counts

As presumptive evidence of radiation injury, vomiting on the day of the bombing is most significant Its early occurrence, and the fact that it is not likely to be overlooked by the patient, makes it of great help in triage and in evaluation It is of interest that the Japanese physicians attributed the vomiting on the day of the bombing to psychological causes However, when the large volume of clinical data was subjected to analysis, the relation between this symptom and probable exposure was indubitable

The oropharyngeal manifestations consisted of a dusky inflammation of the mucous membrane, soreness of the gums, and, in severe cases, an ulceronecrotic breakdown of the tissues, such changes were rare before the third week, and the mean day of onset was the 22nd In severe cases, the appearance of the lesions resembled those seen in agranulocytic angina In some patients, the laryngeal and the upper tracheal mucosa were affected similarly

The hemorrhagic manifestations other than cutaneous purpura included epistaxis, menorrhagia and metrorrhagia, melena, hemoptysis, hematuria, and bloody emesis Most patients with cutaneous purpura of any extent also had some or all of these hemorrhagic manifestations In some whose exposure to radiation was less than the amount required to cause severe radiation injury, these other hemorrhagic manifestations occurred in the absence of cutaneous purpura This suggested that in certain persons with pre-existing disease, a mild hemorrhagic state tended to produce gross hemorrhage in the diseased tissue (e g , with pulmonary tuberculosis or uterine fibroids)

The most serious obstacle to the clinical determination of the severity of radiation injury is the late appearance of the clinical symptoms In general, the earlier the appearance of the so-called specific or suggestive symptoms, the severer the radiation injury

LABORATORY DIAGNOSIS OF RADIATION INJURY

There is no single laboratory procedure that is by itself diagnostic for radiation injury Severe radiation injury to the whole body produces pronounced leukopenia (lymphopenia and granulopenia), thrombopenia, and anemia

Total Leukocyte Count —Leukopenia invariably follows whole body radiation injury In the very severe type the leukocyte count falls to less than 1,000 per cubic millimeter within the first week With less severe degrees of radiation injury the lowest white cell counts are seen two to four weeks after exposure It was the opinion of the Japanese physicians that recovery was unlikely if the total leukocyte count was less than 500 per cubic millimeter

Lymphocytes —In the first few days after exposure the lymphocyte count has greater diagnostic value than the total leukocyte count Lymphocytes start to decrease immediately after exposure Pronounced lymphopenia appears within 24 hours A total lymphocyte count less than 800 per cubic millimeter 48 hours after exposure is presumptive evidence of severe radiation injury A lymphocyte count in excess of 1,500 per cubic millimeter 48 hours after an atomic bombing indicates that radiation injury of clinical significance is unlikely

Neutrophilic Granulocytes —With severe radiation injury, the neutrophils decrease less rapidly than the lymphocytes With doses of radiation that are uniformly fatal to experimental animals the total granulocyte counts are less than 1,000 per cubic millimeter within one week With lesser doses of radiation, such low levels may be attained but it takes much longer, perhaps 10 to 20 days

Thrombocytes —For the first three to four days following severe radiation injury, the thrombocyte count remains fairly stable Beginning four to five days after exposure, the thrombocyte count drops rapidly, attaining values close to zero during the second week Thrombocytes may remain at this low level for two to four weeks

Anemia —In severe radiation injury, anemia develops slowly It may be two to three weeks before it is evident The lowest red cell counts are observed four to five weeks after exposure A rapidly decreasing blood hemoglobin, red blood cell count, or hematocrit is a serious sign and suggests rapid blood loss

Reticulocytes —Reticulocytes decrease in number promptly and are almost absent for three to four weeks Any subsequent increase in reticulocytes is a good prognostic sign

A prominent clinical symptom of radiation injury is the hemorrhagic state that begins between the second and fourth week The severity of this hemorrhagic state is closely correlated with the level of thrombopenia It is characterized by an increased capillary fragility, prolonged bleeding time, and prolonged clotting time

SUMMARY OF THE DIAGNOSIS OF RADIATION INJURY

The diagnosis of the syndrome of radiation injury and the estimation of its severity depend on a proper evaluation of three factors 1 The probability that nuclear radiation sufficient to cause injury reached the patient. This will depend on a knowledge of the patient's location at the time of the bombing, and the estimate of the kilotonnage of the bomb If personnel dosimeters are available, the data obtained from them must be correlated not only with the foregoing but also with the clinical symptoms 2 The existence or the development of any or all of the typical symptoms of radiation injury Early after the bombing, it is proper to attach great significance to the presumptive diagnostic sign of vomiting on the day of the bombing Particular attention should be directed to the tempo at which symptoms develop Early appearance is indicative of greater severity of radiation injury 3 The occurrence and the time-trend of leukopenia and lymphopenia are significant, and should aid materially in the accurate evaluation of the severity of the injury In the absence of cutaneous purpura or other hemorrhagic manifestations, abnormality of clotting and bleeding time does not necessarily imply that the patient has a severe form of radiation injury In conclusion, the diagnosis of radiation injury and the estimation of its severity constitute, essentially, a clinical problem and should be possible on the basis of a brief history, physical examination, and a minimum of laboratory studies

TREATMENT OF THE SYNDROME OF ACUTE WHOLE BODY RADIATION INJURY

In the following discussion the recommended therapy is aimed only at the syndrome of radiation injury Actually, many if not the majority of cases will be complicated by some other type of injury—trauma, burns, or both—which will, of course, require appropriate treatment Certain general considerations must be borne in mind At present there are available no specific agents of proved therapeutic value either for prophylaxis or for treatment following radiation Treatment, therefore, is symptomatic This does not by any means imply that efforts at therapy are a waste of time

The syndrome of severe radiation injury (seen in persons who have received in the neighborhood of 400 r) is, essentially, that of a self-limited disease and at the outset resembles agranulocytic angina As the illness progresses, the hemorrhagic manifestations become more prominent If the patient can be tided over the two to five week period during which pancytopenia is more or less complete, he will in the majority of instances recover normal bone marrow function and normal ability to combat infection The purpura and other manifestations of a hemorrhagic state will disappear, the various formed elements will return to their normal concentrations in the blood, and the lymphoid tissue will return in normal abundance Furthermore, the individual tissues and organs in survivors will show no evidence of radiation damage greater than what they would have sustained singly from the given dose of radiation Treatment from the very beginning should be directed at minimizing the effects of the tendency to hemorrhage and inability to combat infection Wounds should be carefully débrided and every effort made to accomplish healing by primary intention in the shortest possible time This will minimize the tendency for wound disruption during the active stages of the illness All the symptoms other than the initial nausea and vomiting and the loss of hair seen at Hiroshima and Nagasaki can be adequately explained on the basis of pancytopenia, including thrombopenia, plus disturbances in the normal antibody function against bacterial infection Certainly there is, at the present time, insufficient evidence to warrant stockpiling of such items as flavonoid compounds, toluidine blue, protamine, and vitamin B_{12}, as essential to the proper treatment of this type of casualty On the other hand, the data from Japan attest the usefulness of antibiotics and transfusions The value of antibiotics has been substantiated by a number of experimenters

In the absence of data to the contrary, efforts to maintain water balance and good nutritional status, whether by oral or parenteral means, would seem to be of the utmost importance in the presence of diarrhea, hemorrhage, and infection

With these considerations in mind, the treatment of this syndrome can be outlined as follows

Very Severe Cases—In general, this includes cases in which upward of 600 r of whole body radiation was received There is no satisfactory method for treating patients who have received the certainly fatal doses of ionizing radiation which produce this form of the disease Nausea and vomiting appear in one or two hours, followed by prostration within the first 24 hours Before attributing such symptoms to severe radiation injury, however, one must rule out other types of injury as well as emotional disturbances that might produce similar symptoms but from which the patient might recover

Japanese experience indicated that these victims were very sensitive to physical activity, so that they should be given as much rest as possible as soon as possible They should not be transported long distances Treatment should emphasize fluid replacement and efforts to restore electrolyte balance and should include sedation when indicated There would appear to be no particular advantage in the use of antibiotics and blood transfusions in these persons merely on general principles On the other hand, when there are clear-cut clinical indications for their use, they should be employed

Severe Cases—In general, this includes cases in which in the neighborhood of 400 r of whole body radiation was received These persons need and profit most from good medical treatment Although in the absence of trauma and burns they do not require active care in the first few days, strenuous activities should probably not be permitted

Therapy should be directed at (1) restoration of water and electrolyte balance and maintenance of general nutrition, (2) control of infection, and (3) treatment for hemorrhage and anemia The diet should be bland and low in residue Intravenous fluids and parenteral alimentation should be given in the usual manner when indicated and when feasible, in an effort to maintain good nutritional status and to restore water and electrolyte balance in the presence of severe gastrointestinal symptoms Infection can be controlled, at least in part, by the use of antibiotics There is no reason to begin antibiotic therapy sooner than 48 hours after exposure unless required by wounds, burns, or infectious disease When there is little doubt that a victim has been exposed to several hundred roentgens, it is wise, if adequate supplies are available, to start oral maintenance doses of an antibiotic by the third or fourth day Once severe symptoms appear, combined oral and parenteral therapy should be instituted Beginning with several antibiotics at once has not been proved of value On the other hand, it may be necessary to use various combinations in certain cases

Sulfonamides are probably not drugs of choice in radiation injury However, if antibiotics are not available, they would undoubtedly prove lifesaving in certain instances

The only effective treatment for hemorrhage and anemia is replacement therapy by blood transfusion It would seem desirable, whenever possible, to maintain blood hemoglobin at a level of 10 gm or more per 100 cc

Moderately Severe and Mild Cases—In general, the treatment is similar to that suggested above, modified, of course, according to the clinical indications

ULTIMATE PROGNOSIS OF THOSE WHO HAVE SURVIVED SEVERAL HUNDRED ROENTGENS OF WHOLE BODY RADIATION

It is too early to write of the eventual outcome of the Japanese who recovered from radiation injury Radiation cataracts of varying severity have occurred in an appreciable number of those who were close enough to receive a significant amount of radiation It appears likely that the incidence of leukemia will be higher among the survivors than in the Japanese population as a whole There is enough information available now to warrant the statement that the survivors have regained their fertility and that, among the progeny of the survivors at Hiroshima and Nagasaki, no unusual incidence of abnormal offspring has occurred

COMMITTEE ON MEDICOLEGAL PROBLEMS

The Committee on Medicolegal Problems of the American Medical Association has approved the publication of the following report by Louis J Regan M D LL B

MALPRACTICE AND THE PHYSICIAN

The incidence of malpractice claims increased tenfold during the decade between 1930 and 1940 In some localities, malpractice claims have become so frequent that any patient with a less than perfect end result is a potential malpractice claimant If this alarming situation were evidence that the medical profession was becoming increasingly inefficient, then the solution would of course be obvious But the blunt truth is that the majority of all malpractice suits filed are without merit, more than half of them involve physicians who are above the median of their respective groups in skill, experience, and professional standing The search for a solution to this problem demands an understanding of what actually constitutes malpractice, an analysis of the causes of malpractice claims, and a universal knowledge among physicians as to the positive steps which may be taken to decrease both the relatively few justified claims and the preponderantly greater number of unjustified claims

ANY PHYSICIAN MAY BE SUED FOR MALPRACTICE

The bringing of a malpractice action does not even suggest that the claim has merit, for any patient may bring such an action against any physician who has attended him professionally Nevertheless, the practitioner who is the target of the accusation is damaged by the mere filing of the action Accordingly, it is necessary that every physician understand what constitutes malpractice under the law

WHAT CONSTITUTES MALPRACTICE UNDER THE LAW?

The law requires that a physician who undertakes to diagnose or to treat a patient must possess the skill and exercise the care commonly possessed and exercised by other reputable physicians in the locality If he holds himself out as a specialist, he must meet the standards of practice of the specialist in the designated field of practice These legal interpretations of his duty are not changed if the professional services are rendered gratuitously It follows, then, that no malpractice charge is justifiable unless the physician's service to the patient does not meet the requirements of good medical practice, unless in the diagnosis or treatment of his patient, the physician omits to do something he should do or does something he should not do in terms of accepted standards of practice The standard of practice is always determined by what other reputable physicians in the community, or in similar communities, would or would not do in the care of similar cases

This definition of standards needs further clarification for medicine is not an exact science, and not all patients who are given medical treatment get well Many are left with some disability or deformity There are few conditions in which there is available a sole, specific, universally utilized remedy or procedure There is frequently a great latitude for honest difference of opinion and often the attending physician must exercise his best judgment in deciding which of the several methods to adopt In certain circumstances, the physician's acts or omissions may be so unseemly and shocking as to be generally recognized as reprehensible and supportive of legal liability On the other hand, complications or untoward and unexpected results are not uncommon, and the mere fact that a patient is not cured or does not progress favorably does not suggest culpable ignorance or negligence on the part of the medical attendant

UNDER LAW, WHAT SKILL AND CARE HAS THE PATIENT THE RIGHT TO EXPECT?

In the absence of evidence to the contrary, the law presumes that a physician has exercised the ordinary skill and care required of him in treating his patient He is justified if his conduct of the case would be approved by even a respectable minority of his confreres in the same locality He may make a mistake in diagnosis or be guilty of an error of judgment, he may use medicines or methods of treatment different from those which some of his colleagues would have used, he may obtain a bad result instead of a satisfactory one but no one of these things is sufficient to fasten upon him the charge of malpractice Actionable malpractice consists in doing something that should not be done or in omitting to do something that should be done

MALPRACTICE SUITS LESSEN PUBLIC S CONFIDENCE IN MEDICAL PROFESSION

It is of primary importance, of course, that every physician familiarize himself with his legal interpretation of what does and what does not constitute malpractice But that is only the first part of the control of the malpractice contagion for experience has taught us that the most meticulous attention to the dictates of good medical practice is not sufficient to ward off unjust claims and that no physician, regardless of his excellence, is immune The misunderstanding, indeed the ill will, which has been engendered by the great number of unjust malpractice suits has tended to break down the public s confidence in the medical profession This situation has important and far reaching implications for both the public and the medical profession for the public interest is adversely affected when the physician in caring for his patient is forced to give thought, time, and energy to safeguarding himself against the possibility of an unjust malpractice claim The public should be informed of the facts of this problem, for in the long run it is the public—in the persons of individual patients—whose well being is being jeopardized There is no relationship outside the family which is so personal and intimate as that of physician and patient no relationship in which the character, integrity, and conscience of one party are so important to the well being of the other The overwhelming majority of physicians faithfully and unselfishly meet the demands and obligations of their calling, and the majority of patients do not unjustly file malpractice suits. The acts of the ignorant, the greedy, the callous few—among either patients or physicians—must not be permitted to destroy the merited esteem in which the profession as a whole is held.

HOW MUCH SHALL THE PHYSICIAN TELL HIS PATIENT?

As a basic step in improving the situation, the physician must realize that at all times he is obligated to act with the utmost good faith toward his patient. Thus, if he knows that he can not accomplish a cure or that the treatment adopted will probably be of no benefit, he is duty bound to advise his patient of these facts. It is extremely doubtful that a physician has a therapeutic privilege to withhold a specific diagnosis from a patient who is sick with serious or fatal illness. To the contrary, the confidential relationship requires in ordinary circumstances that the physician make a frank and full disclosure of all the pertinent facts to any adult and mentally competent patient. Such completely open handling of a case would do much to improve the physician-patient relationship and to remove the possibility of unjust malpractice actions. However, there are other unavoidable and even psychological factors in the practice of medicine which must also be considered carefully in this respect.

FACTORS THAT PROMOTE MALPRACTICE SUITS

If physicians were always able to obtain perfect results there would be, of course, no malpractice actions. But deaths, untoward and unexpected results, continuing disabilities, and complications occur and will continue to occur. Whether or not the uncured patient brings an action is often determined by his feeling toward the physician. Patients who have a feeling of friendly trust for the physician and who believe that everything possible has been done for them are not so likely to sue for malpractice—even when bad results ensue. Malpractice suits more often arise if the patient is resentful of some fancied or actual affront, if he believes that he has not been sufficiently closely attended, or—above all—if some third person raises a doubt in his mind as to the propriety of the treatment. In regard to this last point, it would be sheer folly to assume that the 'third person' is always—or even most often—a layman who is uninformed about the facts of the case. Regrettably, many of these people are physicians who are also uninformed about the details and facts but who precipitate unjustifiable suits by criticising directly or by implication the work of physicians who have cared for particular cases.

Another potential danger to the physician-patient relationship arises from the physician's lack of attention to certain elements of patient psychology as factors in malpractice causation. Although the patient is sick or injured when he comes to his physician, he nevertheless visualizes himself as he was prior to becoming sick—with his body structures intact. Thus, unless the physician understands this viewpoint and prepares the patient properly, the patient with a fracture, for example, is likely to compare the final result with the part prior to injury, not with the injured member as presented to the physician. As another example of patient psychology, the average patient is not disposed to understand an error in diagnosis or the failure to make an early diagnosis. Or again, the unwarned patient is not happy with the surface tissue changes which are sometimes associated with deep x ray therapy.

An analysis of malpractice claims reveals the significant fact that they arise almost invariably out of the first course of treatment. In other words, it is rare indeed that an old patient instigates a suit against his physician. It is obvious, then, that from the very first contact—indeed, especially with the very first contact—the physician should do everything within his power to develop an honest, frank, and psychologically sound relationship with his patient.

HOW PHYSICIANS MAY SAFEGUARD THEMSELVES AGAINST MALPRACTICE SUITS

The foregoing discussion has analyzed what malpractice is and what can be done in the physician's conduct to avoid real malpractice or to forestall the filing of an unjust claim. But it would be completely unrealistic to assume that any course of conduct on the part of the physician would prevent his being unjustly sued for malpractice. Good medical practice in itself is not enough, the physician must be able to defend his actions by proof of what he has done. He must not only know his legal duty to his patient, but he must fulfil it. He must know and take advantage of every measure to protect himself against the unjustified claim of malpractice. Under present circumstances, it is absolutely foolhardy for any physician to be ignorant of or careless of malpractice prophylaxis. He must take positive actions carefully based upon his legal responsibilities and liabilities.

To begin with, a physician is not legally obligated to undertake the care of any patient. But from the time he assumes the responsibility until he is discharged or withdraws from the case, he must give—or be sure that there is given—the care and treatment required by the condition of the patient. Before a physician may, without legal liability, withdraw from a case he must give reasonable notice of his intention and allow the patient reasonable opportunity to fill his place.

By notice or special contract, the physician may limit the service he is to render. He may agree to treat the patient only at a certain place, or for a limited time, or for certain conditions. On the other hand, he may increase his obligation by expressly agreeing or warranting that he will effect a particular result, in this circumstance, he will be liable on his contract or warranty if he fails to fulfil the agreement. A physician is not an insurer of results unless he makes himself one by his special promise.

Many malpractice actions are brought as the result of some unwise statement made by the attending physician, or his partner, assistant, or office nurse, to the patient or to a friend of the patient. Care should be taken to avoid making any remark constituting an 'admission' of fault, or one which may be construed as such. It is understandable that such remarks have been made under emotional stress or when exercising 'hindsight' in the face of an unsatisfactory result even when good practice has been followed throughout. A single careless statement might create liability for damages where actually no liability exists. The effect of such a remark when reported to a jury is incalculable and almost impossible to counteract. Further, an admission on the part of the defendant may free the plaintiff from the necessity of offering medical expert testimony.

EXPERT TESTIMONY AND RES IPSA LOQUITUR

Generally, the proof of a physician's negligence must be established by the testimony of medical expert witnesses. The application of the doctrine of *res ipsa loquitur*[1] in a case gives rise to an inference of negligence on the part of the defendant, and relieves the plaintiff of the necessity of proving the alleged malpractice by the testimony of experts. It places on the defendant the burden of making explanation, if he can, to offset the inference of negligence and by the majority rule a question is created for the jury, regardless of any and all evidence presented by the defendant.

The doctrine of *res ipsa loquitur* has been held applicable in the field of malpractice chiefly in cases which involve (1) slipping instruments, (2) sponges left in the tissues, (3) burns from heating modalities, (4) roentgen radiation injuries, generally limited to cases wherein the roentgen ray is being used diagnostically, (5) infection through the use of an unsterilized needle or instrument, and (6) injury to a portion of an anesthetized patient's body outside the field of treatment or operation.

A GOOD CASE RECORD IS A VALUABLE SAFEGUARD

The importance of good medical case records as a factor in malpractice prophylaxis can not be overestimated. A good medical case record should contain a history[2] of the case and a physical examination of the patient, together with reports of all indicated laboratory studies. These data constitute the foundation of the medical record and will generally serve as the basis for at least a working diagnosis. If diagnosis is not possible, consulta tion is desirable Consultation reports must be in writing Thereafter, a good record will reflect (by means of progress notes) a *sequential history of the case*, its course, complications, and sequelae and, thus, the justification for further or changed investigation and treatment Such a record will contain a statement of all treatment rendered in the case Copies of special forms and of reports used or made in a particular case are also a part of a good record It is desirable that an attending physician ask himself from time to time what he would wish to have in the record of the case under treatment in the event he should later be called upon to justify in court his conduct of the case If a patient discontinues treatment before he should or fails to follow instructions, the record should show it A good method is to file a carbon copy of the letter sent to the patient advising him against the unwise course [3]

---

[1] *Res ipsa loquitur* (literally, the thing speaks for itself) is a doctrine of the general law of negligence. It is held applicable whenever one person is injured by an instrumentality entirely in the control of another person, the use of which does not ordinarily result in injury if the person in control exercises due care.

[2] It is important to indicate the source of the medical history (from the patient, member of family, etc).

UNWARRANTED PROFESSIONAL CRITICISMS PROMOTE MALPRACTICE SUITS

The precipitating cause of a majority of all malpractice actions is found in the unwise comments or criticism of physicians with regard to treatment given to patients by other physicians Commonly it is criticism by a succeeding physician of the work of his predecessor Various authorities have estimated that 50 to 80 per cent of all the suits for malpractice would be eliminated if such destructive criticism could be stopped It is profitless to attempt to determine why physicians are so prone to criticise destructively and unethically, but the results of it are deplorable Legitimate criticism rests only on full knowledge of the facts as gathered from all parties, from the physician who treated the patient, as well as from the patient

OTHER PREVENTIVE PRECAUTIONS

The importance of tact can hardly be overemphasized It should be manifest especially in the handling of the patient and the patient s family, in the avoidance of fee disputes and unwise efforts and methods in the collection of fees (considering the provisions of the statute of limitations), in the avoidance of overoptimistic prognoses and especially of any promise constituting a guarantee of a particular result, in the avoidance of betrayal of privileged communications, in the avoidance of making any statement constituting (or which might be construed as) an ' admission ' of fault or negligence, in the avoidance of any reference to malpractice insurance protection, and in the securing of legal advice before making any statement in regard to a malpractice claim or suit

LIABILITY FOR ACTS OF OTHERS

In addition to being responsible for his own acts and omissions, a physician encounters, in his everyday practice, instances in which he may also be responsible for the negligent acts and omissions of others Thus, he is responsible for the acts of his assistants and employees, for their negligence occurring during the course of their employment Where doctors practice as partners, each partner is liable not only for his own acts and those of his partner, but for the negligent acts of any agent or employee of the partnership

When two independent practitioners are caring for a patient, each is liable not only for his own acts but for doing nothing about the negligent acts of the other which he has observed or which in the exercise of ordinary diligence he should have observed

The attending physician is generally not liable for the negligence of an interne, a nurse, or other hospital employee He is, however, responsible for the acts of the hospital personnel in so far as they are carried out under his immediate supervision and control Thus, the operating surgeon and not the hospital is held liable for any negligence of operating room attendants during the performance of surgery

CONSENT FOR OPERATIONS, TREATMENT AND AUTOPSIES

Consent for operation must always be secured Any adult in a clear state of mind may authorize operation upon himself Oral consent might be considered sufficient, but because of the difficulty in proving that it was given, the physician should invariably require a witnessed consent in writing If the patient is a minor (that is, a person under the age of twenty-one) consent is to be obtained from parent or guardian [4] If the individual is mentally incompetent, the consent of the one who stands in the position of guardian is required

When an operation is made compulsory by law (such as vaccination or sterilization [5]) the law furnishes the consent. If an operation is unlawful, consent to the performance thereof does not absolve the surgeon from liability

In an emergency which demands immediate action for the preservation of the life or health of a patient and in which it is not practicable to obtain his consent or the consent of any one authorized to speak for him, it is the duty of the attending physician to perform without consent such operation as good surgical practice demands [6]

If sterility is likely to result from the surgery which is contemplated, explanation of that probability should be made and a signed authorization obtained from both spouses It should be borne in mind that it is hazardous to sterilize any person except upon a positive medical indication Further, there should be no promise or guarantee that the patient will be sterilized as the result of the procedure undertaken.

The individual physician must secure consent to perform a postmortem examination This, too, should be in writing [7] and sufficiently comprehensive to allow the removal and taking away of tissue if such is to be done.

The trend of the cases in recent years indicates that it is extremely unwise to pursue a course of treatment in itself hazardous or capable of producing harmful effect without securing a written statement from the patient, or from someone legally responsible for the patient—a statement which clearly expresses understanding of and consent to the special treatment.

FAILURE TO USE RECOGNIZED DIAGNOSTIC AIDS

There are a large number of malpractice actions in the law reports which may be classified under the general heading of ' Insufficient Treatment Cases " In every field of medical practice there are cases illustrating "insufficient care the failure to make a blood count, a Wassermann, a pregnancy test, a culture, a smear, a urinalysis, a stool examination, an x-ray, original or follow up, failure to make a complete diagnosis or overlooking a reasonably determinable condition, failure to utilize an indicated prophylactic measure (diphtheria, tetanus, etc), the failure to give instructions, to follow up the original treatment or operation, to institute measures to protect contacts, etc, etc

Failure to use the x ray at all, or failure to make sufficient use of the x ray, has been the chief allegation in many malpractice actions Whenever a fracture is present which was not diagnosed and no x-rays were taken, the conduct of the attending physician is likely to be condemned as not coming within the standard of good practice [8] Whenever a bad result, deformity or limitation of motion occurs, the defense is immeasurably strengthened by the possession of a series of x rays taken at intervals during the progress of the case Whenever a patient refuses to have an x ray made, the physician should fortify himself with the strongest written evidence X-ray records, as well as the entire case record, should be carefully preserved beyond the time during which a malpractice action may be brought

The statute of limitations provides the period of time after which specified actions may not be brought The time provided varies greatly in the several states A physician should wisely inform himself of the situation in his own state

---

[3] There is a legal presumption that a letter mailed has been received by the addressee but there is no presumption that a letter has been mailed

[4] Statutory exception In California a female of the age of 18 or more who is or has been married is an adult for the purpose of this consent.

[5] Under Eugenic Sterilization Statutes

[6] 48 C. J 1131 Jackovach v Yocum (Iowa) 237 N W 444

[7] In California and several other states it is criminally illegal for any person to perform an autopsy without having first obtained the written authorization of the coroner or other authorized public officer or of the person who has the right of disposition of the body

[8] The failure to make use of x ray as an aid to diagnosis in cases of fracture amounts to a failure to use that degree of care and diligence ordinarily used by physicians of good standing in the community and the court, in absence of expert testimony may take judicial notice of such fact. Agnew v City of Los Angeles (Cal) 218 Pac. (2d) 66

OBLIGATIONS TO PATIENTS

To summarize, the physician who would understand his legal obligations, responsibilities and duties to his patient, must constantly bear in mind the following fundamental obligations

1 The physician must possess the degree of skill commonly possessed by other reputable practitioners in the same field of practice

2 He must exercise the degree of care, diligence, and judgment commonly and ordinarily exercised by other reputable members of his profession in similar circumstances

3 He must keep abreast of progress and follow good practice, common practice, in diagnosis and treatment, he must not experiment

4 He must not neglect or abandon his patient, he must proceed diligently, without unnecessary delay

5 He must give his patient sufficient attention and must utilize the indicated diagnostic aids

6 He must find or anticipate any condition reasonably determinable or reasonably likely to develop

7 He must obtain legal consent to operate and to perform an autopsy

8 He must give proper instructions (that is, instructions consistent with the standard of practice) for the care of the patient in his absence, and for the protection of those coming in contact with the patient

9 He must fulfil the terms of a special contract if he makes one

The foregoing directions for reducing and avoiding the instigation of malpractice suits will not, of course, guarantee that a physician will not be sued unjustly for already malpractice may be regarded as a contagious disease of the social body There are several major reasons for this condition, but two are paramount. (1) the winning of a suit inevitably encourages the filing of others as patients become increasingly suit conscious , and (2) such suits are difficult to defend and the knowledge of how best to conduct such a defense is not sufficiently widespread The inter-relationship of these two points will be obvious, for each successful defense of an unjust suit will serve as a discouragement to the filing of others But the second of these causes of high malpractice incidence—the difficulty of conducting a defense—is dangerously enlarged by many physicians themselves Large numbers of medical men are naive enough to believe that their patients would never file such suits and that no precautions need be taken, and yet such precautions are the only assurance of the best possible defense in the event of a suit The most vulnerable physicians are those who know that they are maintaining at least an average standard of practice and who are therefore (and blindly) assuming that they will not be sued This discussion is concerned with *unjust* claims no doctor who is actually guilty of malpractice should be allowed to go free of penalty Meritorious claims should be settled out of court—preferably before a suit has been filed

PROMPT ATTENTION SHOULD BE GIVEN TO CLAIMS

Another too frequent hindrance to an adequate defense is delay in the investigation of claims, such delay is highly disadvantageous to the preparation of a defense As a final word of warning that the physician may need every available precaution, one must consider the conditions under which most cases are heard They are tried before juries made up of lay persons, and it is a truism that no one can say what a jury will do This is particularly true of malpractice cases, for certainly lay jurors can not be expected to understand complex medical facts How does a jury arrive at a decision when two expert witnesses testify that the defendant s conduct of the case did not meet the required standard, and two others declare that what the defendant did was consistent with the usual and ordinary practice in the community?

To physicians who have had little or no experience with the law and to lawyers who have little or no medical knowledge, the problem of adequately defending the unjust malpractice case seems insurmountable And it is true that far too many such cases have been lost simply through poor defense This is an aspect of the problem which needs a great deal more attention particularly in areas which have become virtual hot beds of nonmeritorious malpractice claims At all times and to all physicians, there should be available expert advice on problems relating to the physician patient relationship [9] Whenever a threat is made against a physician, a carefully prepared procedure should be put into effect Unjustified claims should be contested as thoroughly as possible In such cases it is sheer folly to compromise, on the theory that a slight settlement would be less expensive than the cost of defense Such a course simply serves as an encouragement to others whose claims are not justified This shortsighted view is largely responsible for the rapid increase in the number of malpractice claims in some sections of the country If cases based upon unjust or absurd claims are permitted to receive even a slight profitable return, there will be an incentive to bring more of them

BE SLOW TO COMPROMISE

It is a great temptation to a doctor to rid himself of a nuisance claim by making a small settlement The unfavorable publicity, the loss of time, and the mental and emotional strain involved in defending a malpractice suit may lead the physician to compromise But, as is so often true, the easiest way out of a situation is seldom the best For the sake of both himself and his colleagues, the doctor should make a determined opposition to an unjustified claim

A LIST OF COMMANDMENTS' IN MALPRACTICE PREVENTION

In the final analysis, it is the physician himself who is responsible for the continuing existence of the vicious malpractice situation The physician has generally been satisfied to pay his professional liability insurance premiums and thereafter to sit back complacently doing nothing until he becomes a target for a malpractice claim He must be brought to realize that his money payment is only a part of his insurance premium, a much more important part is his contribution of time, of study, and of putting into effect all possible measures to safeguard himself and his colleagues

Prevention is the best defense against malpractice Listed below are the 23 malpractice prophylaxis commandments'

1 The physician should care for every patient with scrupulous attention to the requirements of good medical practice

2 The physician must know his legal duty to the patient

3 The physician must avoid destructive and unethical criticism of the work of other physicians

4 The physician should keep ideal" medical records in every case records that would be presentable when offered in court, records that clearly show what was done and when it was done records that clearly indicate that nothing was neglected and that the care given met fully the standard demanded by the law If any patient discontinues treatment before he should, or fails to follow instructions, the record should show it a good method is to file a carbon copy of the letter which advises the patient against the unwise course

5 The physician should be careful to avoid making any statement which constitutes or which might be construed as an admission of fault on his part Such an admission, which is usable against the physician might be made to a third party as well as to the patient at any time before the trial Such an admission may be made by an agent or employee of the physician during the course and within the scope of the employment It is important to instruct employees to make no statements

6 The physician should exercise tact as well as professional ability in handling his patients A proper professional manner and a sound attitude should be maintained at all times toward both the patient and the patient's family The attentive physician may early sense some unsatisfactory and disturbing under-current which, by the institution of protective measures, may be prevented from developing into something much more unpleasant Thus, if the patient is not doing well, consultation may be suggested, if the patient is dissatisfied or complaining, or if the family s attitude indicates dissatisfaction, consultation should be demanded The use of a consultant affords, in any case, great protection against a malpractice claim

7 The physician should refrain from overoptimistic prognoses and should avoid promising too much to the patient

---

[9] Regan L J Doctor and Patient and the Law St. Louis The C. V Mosby Company 1949 chap 20

8 The physician should advise his patients of any intended absence from practice and should recommend, or make available, a qualified substitute

9 The physician should unfailingly secure written consent for operation and for autopsy

10 The physician should carefully supervise assistants and employees and take great care in the delegation of duties to them

11 The physician should have some knowledge of the statute of limitations and of its significance

12 In his selection of patients the physician should limit himself to such fields as are well within his qualifications He should keep abreast of progress in the medical profession

13 The physician should keep inviolate all confidential communications

14 The physician should frequently check the condition of his equipment and make use of every available safety installation

15 In the treatment of the patient the physician must not experiment

16 The physician must be careful to render sufficient care to his patient in general instructions, frequency of visits, clinical and roentgen ray laboratory investigations and the like Moreover, every precaution should be instituted for the protection of those caring for the patient and of all other contacts

17 The patient must not be abandoned The physician-patient relation can be terminated without liability only in certain ways and under certain conditions

18 The physician should never reveal that he carries professional liability insurance Except on the recommendation of his legal adviser, he should never write a letter or make any statement with reference to a malpractice claim Immediately on being advised of even the possibility of suit, he should consult with his attorney

19 The physician should arrive at an understanding in the matter of fees Misunderstanding in this matter, particularly when the question of excessive fees arises, contributes an avoidable element of risk

20 The physician should secure legal advice if he is called to attend a coroner s inquest as a witness in a case in which he has been in professional attendance

21 The physician should realize that because of the possibility of error in transmission, it is dangerous to telephone a prescription

22 The physician should realize that it is hazardous to sterilize any patient except when a medical indication exists

23 Except in actual emergency, the physician should not examine a female patient unless a third person is present There is no more serious or destructive charge than that of undue familiarity, and the only way to avoid claims of this sort seems to be to have some one else present during all examinations

CONCLUSIONS

There must be recognition of malpractice as a problem, that the conditions created by it are harmful to the physician and injurious to the public, and that action must be taken to correct it

The public should be informed as to (1) what constitutes malpractice, (2) how really few cases of actual malpractice occur, and (3) the major degree of responsibility which the individual has in the maintenance of his own health

Physicians must learn what they may do to safeguard themselves, and must put into effect every possible precaution against an unjust malpractice accusation

ADDENDA

I CONSENT TO OPERATION

Place
Date

1 I hereby authorize and direct Dr
to perform the following operation upon me

and to do any other procedure that (their) (his) judgment may dictate during the above operation

2 I understand that the surgeon (surgeons) will be occupied solely with the surgery and that the administration and maintenance of the anesthesia are independent functions and will be in charge of Dr I consent to the administration of such anesthetic or anesthetics as Dr may deem advisable in my case

3 It has been explained to me that I may be sterile as a result of this operation although no such result is warranted or guaranteed I understand what the term sterility means and in giving my consent to the operation I have in mind the possibility (probability) of such a result

A M Signed

Name of Patient
Address
Dear *Mr*

At the time of my examination of your ankle this afternoon I advised you of the desirability of having x rays made This you refused to do

Upon your insistence that I treat your ankle and foot without benefit of x rays, I agreed to do my best in the circumstances but as I advised you this afternoon and must repeat now I cannot establish without x rays whether or not you have incurred a fracture

In your own interest I urge that you have an immediate x-ray study made of your foot and ankle

Yours very truly

B

Dear Mrs

Upon the history you gave me and my findings on examination, both of this date I am not able as I told you at the time of your visit, to rule out pregnancy as the cause of the vaginal bleeding of which you complain

You have told me that you will not submit to a pregnancy test. I again now advise you of its desirability I hope you will come in tomorrow morning prepared as I instructed you to have the test made If you continue to refuse to submit to this test, it will be necessary to have a consultant see you tomorrow if I am to continue to advise you

Yours very truly

C.

Dear Mrs

When in response to your call today I saw your husband at your home I told you my opinion was that he is very seriously ill with pneumonia and that he should be immediately hospitalized You refused to permit me to have him removed to the hospital I told you that I am willing to do the best I can for him under the circumstances but that he could be better cared for and he would be safer with less likelihood of complication in the hospital

Your husband s condition is such that the matter cannot be discussed with him so I hope that you will now after giving the matter more thought authorize his removal to the hospital.

Yours very truly

D

Dear Mrs

You brought your seven year old boy in today for me to see He has a deep penetrating wound on the sole of his foot apparently resulting from his stepping on a nail You thought that it had been received in a neighboring stable

I advised you that the boy should immediately be given an injection of tetanus antitoxin You refused to permit me to administer this to him stating that you had heard of two children who had severe reactions following such prophylactic treatment

I told you that I would make a preliminary test which would warn us of the likelihood of severe reaction but that I could not guarantee that result or any result You reiterated your refusal

I cannot give the boy this treatment or any treatment without your consent I urgently recommend that you permit me or some other physician of your choice to administer a preventive dose of tetanus antitoxin to your boy without further delay

Yours very truly

V PATIENT FAILS TO KEEP APPOINTMENT

SAMPLES[4]

4 When a patient fails to keep an appointment or discontinues treatment before he should it is desirable to send him a letter incorporating the pertinent facts and the recommendations File a carbon copy endorsed with a certificate of mailing with medical case record Registered mail may be used

Place

Date

A.

Name

Address

Dear Mr

My records indicate that you failed to keep your appointment of (date) and that you have not made any subsequent appointment or appearance in the office

In your own interest may I call to your attention the fact that further professional attention is in my opinion definitely needed If there is some reason why you prefer not to return to this office I urge that you immediately seek other competent professional care I shall be glad to give the benefit of my knowledge of your case to your subsequent physician should you elect to receive the needed attention at other hands

Yours very truly

B

Dear Mrs

You have not returned as arranged since at your request, I examined you on last Friday

The history you gave of spotting between periods over the last several months and my findings on examination which I related to you are of such significance that as I endeavored to impress upon you when I made an appointment for you to return with your husband I must urge upon you the advisability of having immediate medical attention

If you do not wish to return to me you should consult another physician at once

Yours very truly

C

Dear Mrs

You failed again today to appear in accordance with your appointment at the Radiologist s office so that a check-up x ray could be made of your fractured wrist

I have previously urged upon you the necessity of having your cooperation to improve the likelihood of a favorable result.

You should not be heard to complain of the end result if it is not satisfactory when you refuse or neglect to follow the advice of your physician

I now request that you appear at my office at ten o clock tomorrow morning. I am arranging to have x rays made at that time and to have a specialist in orthopedic surgery see your arm

Yours very truly

VI PATIENT DISCHARGES PHYSICIAN FROM CASE[5]

5 If a physician justifies his failure to continue in attendance upon a patient upon either his having withdrawn from the case or of having been discharged by the patient the burden of proof of such contention is upon him—hence the desirability if not the actual necessity of having written evidence available

Dear Mr or Mrs

This is confirmation and my acknowledgment, of the fact that you have as of this date discharged me from further professional attendance upon you in your current illness

Should you desire I shall be glad to cooperate with the physician you now call in supplying him with such information as I have gained in respect to your case

Yours very truly

VII PHYSICIAN WITHDRAWS FROM CASE

Note A physician may withdraw from attendance upon a patient but he must give reasonable notice of his intention to do so and must allow the patient reasonable time and opportunity to fill his place If the fact whether a physician did withdraw from professional attendance upon a patient became an issue in the case the burden of proof falls upon the physician For this reason it is desirable that written evidence be available

It is a serious question of judgment whether when a patient fails to cooperate or refuses to follow advice the physician should continue on the case It is recommended that if the physician decided to continue to care for an uncooperative patient a patient who for example refuses to have an indicated x ray study made he should demand and require consultation

SAMPLES[6]

6 Letters should be sent and carbon copy filed The wording should be simple and direct but the intent and meaning must be clear and certain

Place

Date

A

Name

Address

Dear Mr

You have repeatedly failed to follow my advice and recommendations

I am therefore advising you of my intention to withdraw from further professional responsibility in connection with your case To allow you a reasonable opportunity to secure another physician I shall be available at your request to render you service for three days from your receipt of this letter but not thereafter In this period of time in this community of several hundred physicians you can readily fill my place

I shall be glad to give to any reputable physician of your choice the benefit of such knowledge as I have gained of your case

Yours very truly

B

Dear Mr

You consulted me this afternoon in connection with an injury to your foot and ankle At that time upon your refusal to have x rays made of the injured area I advised you that I could not undertake to render professional service to you

So that there may be no misunderstanding I am confirming these facts in writing

Yours very truly

C

Dear Mrs

As I told you this morning I cannot longer continue to be professionally responsible for the care of your little boy This decision is necessitated by the fact that you have repeatedly refused to permit me to make the detailed and thorough study of his condition which I regard as indicated and vital

Please secure other medical attention at once In the meantime and for a reasonable time I shall remain available at your request to render any routine or emergency service that may be required

I shall of course be glad to offer to Tommy s new physician the knowledge of his case which I have been permitted to acquire

Yours very truly,

D

Dear Mrs

You failed to keep your appointment this week

At the time you received your injection last week a portion of the needle broke off in your tissues You were at once advised of this accident. As I told you after preliminary search I was unable to recover the broken piece without anesthesia and incision, and recommended that localization studies be made prior to undertaking definitive search

I again recommend that procedure and will make arrangements at your request and responsibility

Yours very truly

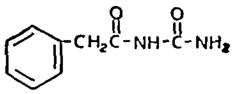
Phenacemide —Phenurone (Abbott) —$C_9H_{10}N_2O_2$ —M W 178 19 —Phenylacetylurea —The structural formula of phenacemide may be represented as follows



Actions and Uses—Phenacemide is a synethetic anticonvulsant with only minor sedative action In experimental animals the drug shows effectiveness against electroshock seizures and convulsions produced by pentylenetetrazole Large doses produce marked ataxia and loss of reflex activity Studies in animals also indicate that the liver plays a major role in the destruction of the drug

Phenacemide is used in the treatment of pyschomotor epilepsy, grand mal and petit mal epilepsies and in the management of mixed seizures *The drug has serious side effects Personality changes (including attempts at suicide and toxic psychoses), hepatic damage and bone marrow depression, as evidenced by leucopenia and aplastic anemia, have followed administration of the drug It should be employed only by physicians experienced in the treatment of epilepsy and only in patients whose seizures are difficult or impossible to control with other recognized anticonvulsants*

Phenacemide should not be employed in patients with evidence of liver dysfunction and should be used with caution in patients with histories of personality disorders or sensitivity to drugs It may be advisable to hospitalize such patients for observation during the first weeks of treatment Psychiatric signs such as withdrawal and loss of interest indicate onset of serious personality changes Careful clinical observation throughout the course of therapy is especially important during the first six months, the physician must be constantly alert for such symptoms as anorexia, nausea, vomiting general malaise, fever rash or jaundice, as they may be early signs of liver damage or blood dyscrasia Anorexia, nausea and vomiting may be due to only gastrointestinal distress, but if persistent may be of more serious significance Patients should be instructed to report such signs immediately Blood counts and liver function tests should be made on all patients preliminary to and regularly during treatment

Dosage—Phenacemide is administered orally and the dose determined according to the response of the patient and the degree of control already obtained with other anticonvulsant agents It may be given in conjunction with phenobarbital, diphenylhydantoin sodium, trimethadione or paramethadione It is recommended that when some control has been achieved with other medication, this should be continued and phenacemide added at a dosage of 0 5 gm three times daily with meals The dose should be increased gradually to the minimum required for adequate control or until limiting side effects develop The action of an average dose appears to last for three to five hours If control by phenacemide alone is anticipated, other medication can be reduced, but if a combination of phenacemide with other drugs permits better control, or allows control with lower dosage of phenacemide or less disturbing side effects, the combination of medication should be continued Doses as small as 0 25 gm three times daily may be adequate in some cases The average total daily adult dose seldom exceeds 2 to 3 gm For children 5 to 10 years of age, approximately half the adult dose is recommended The maintenance dose should be the smallest amount which will adequately control seizures Personality disturbances, signs of liver damage, rash or depression of the blood count, particularly of erythrocytes and polymorphonuclear leucocytes, are indications for withdrawal Cautious reinstitution of therapy may be considered when improvement occurs

Tests and Standards—

Physical Properties Phenacemide is a white to creamy white odorless tasteless crystalline solid It melts between 212 0 and 216 0 C. It is slightly soluble in alcohol benzene chloroform and ether; and is very slightly soluble in water

Identity Tests To 5 mg of phenacemide in an evaporating dish add 2 ml of 1% potassium nitrate in sulfuric acid Heat the mixture on a steam bath for 30 min. then add 10 ml of water and 0.2 gm of zinc dust Heat the mixture on a steam bath for 30 min Cool dilute to 25 ml. and filter Transfer 1 ml of the filtrate to a test tube add 1 ml of 20% toluenesulfonic acid 8 ml of water and 1 ml of 0 1% sodium nitrite and allow the mixture to stand 3 min. Add 0 5 ml of 0 5% sodium sulfamate and allow the mixture to stand 2 min Finally add 5 ml of 1 250 N,N-dimethyl 1-naphthylamine in alcohol and allow the mixture to stand 15 min. the solution becomes light purple

Using about 0 4 gm of phenacemide, prepare phenylacetic acid as directed in the assay through, 'Evaporate the extract to dryness blow off the last traces of chloroform Recrystallize the residue from water and dry it over phosphorus pentoxide in a vacuum for 24 hours the phenylacetic acid obtained melts between 75 0 and 77 0 C

Purity Tests Dry about 1 gm of phenacemide accurately weighed for 4 hours at 105 C. the loss in weight is not more than 1 0%

Ignite about 1 gm of phenacemide accurately weighed the residue is not more than 0 05%

Assay (*Phenylacetic Acid*) *Transfer about 0 4* gm of phenacemide accurately weighed to a 100 ml round bottomed flask. Add 50 ml. of water and 8 ml of sulfuric acid and reflux the mixture for 1 hour on a hot plate Transfer the contents of the flask to a 250 ml separatory funnel and wash the condenser and flask with three 15 ml portions of chloroform Add the washings to the separatory funnel and extract the phenyl acetic acid first with the combined chloroform washings (45 ml) and then with five 20 ml portions of chloroform Filter the combined chloroform extracts through cotton and wash the filter thoroughly with 20 ml of hot chloroform Evaporate the extracts to dryness, blow off the last traces of chloroform and dissolve the residue in 25 ml of alcohol Titrate the solution with 0 1 *N* sodium hydroxide using phenolphthalein T.S as an indicator Each milliliter of 0 1 *N* sodium hydroxide is equivalent to 0 01361 gm of phenylacetic acid and 0 01782 gm. of phenacemide The amount of phenylacetic acid present is not less than 74 9 nor more than 77 9% equivalent to not less than 98 0% nor more than 102 0% of phenacemide

Dosage Forms of Phenacemide

TABLETS *Identity Tests* Using an amount of crushed tablets equivalent to about 0 4 gm of phenacemide prepare phenylacetic acid as directed in the assay through Evaporate the extract to dryness blow off the last traces of chloroform Recrystallize the residue twice from water and dry it over phosphorus pentoxide in a vacuum for 24 hours the phenylacetic acid obtained melts between 75 0 and 77 0 C

Assay (Phenylacetic Acid) Weigh 20 tablets and grind them Accurately *weigh the equivalent of* about 0 4 gm of phenacemide and transfer it to a 100 ml round bottomed flask. Proceed as directed in the assay for phenylacetic acid in the monograph for phenacemide starting with *Add* 50 ml of water and 8 ml of sulfuric acid The amount of phenacemide present is not less than 95 0% nor more than 105 0% of the labeled amount.

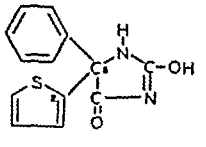
Phethenylate —Thiantoin (Lilly) —5-Phenyl-5-(2 thienyl)hydantoin —$C_{13}H_{10}N_2O_2S$ —M W 258 29 —The structural formula for phethenylate may be represented as follows



Actions and Uses —Phethenylate is employed for the same purpose as its sodium salt See the monograph for Phethenylate Sodium

Dosage —Phethenylate is prescribed in doses equivalent to those for phethenylate sodium See the monograph for the sodium salt

Tests and Standards —

Physical Properties Phethenylate is a white tasteless hygroscopic microcrystalline powder with a slight characteristic odor It melts between 255 and 259 One gram of phethenylate is soluble in about 35 ml of alcohol. It is slightly soluble in chloroform and ether and very slightly soluble in benzene and water The pH of the saturated aqueous solution is about 6.5

Identity Tests To a dispersion of about 20 mg of phethenylate in 3 ml of thiophene-free benzene add a solution of about 10 mg of isatin in 1 ml of sulfuric acid shake the mixture vigorously for about 1 min and allow the tube to stand for 30 min the acid layer becomes a stable brown green Run a blank on the reagents no change in color occurs in the acid layer *(The test proves the presence of the thienyl group and distinguishes phethenylate from diphenylhydantoin)*

Purity Tests Dissolve the residue from the ignition of phethenylate as described later in 20 ml of hot water Cool the solution add 2 ml of diluted acetic acid and make up to a total volume of 25 ml Run a heavy metals test as directed in *U S P XIV* p 717 no more turbidity develops than in a control containing 30 γ of lead

Dry about 1 gm of phethenylate accurately weighed for 24 hours at 105 the loss in weight is not more than 1 0 per cent

Char about 1 gm. of phethenylate accurately weighed over a low flame Cool the charred mass then add 1 ml of sulfuric acid and continue ignition until no carbon remains the residue is not more than 0 10 per cent

Assay (Phethenylate) With gentle heat dissolve about 0 5 gm. of phethenylate, accurately weighed in 50 ml of alcohol and 45 ml of water contained in a 250 ml Erlenmeyer flask Titrate the dissolved acid with 0 1 *N* sodium hydroxide using thymolphthalein T S as an indicator Run a blank titration on the alcohol Each milliliter of 0 1 *N* sodium hydroxide consumed is equivalent to 0 02583 gm of phethenylate The amount of phethenylate present is not less than 97 0 nor more than 103 0 per cent.

(Nitrogen) Carry out a Kjeldahl or a semi micro Kjeldahl determination as directed in *U S P XIV* p 740 The amount of nitrogen present is not less than 10.5 nor more than 11.2 per cent, equivalent to not less than 97 0 nor more than 103 0 per cent of phethenylate

Dosage Forms of Phethenylate

SUSPENSION *Identity Tests* Shake the suspension thoroughly Extract a volume of suspension equivalent to about 0 5 Gm of phethenylate with four 25 ml portions of ether Evaporate the combined ether extracts on a steam bath and dry the residue at 105 for 1 hour On a dispersion of about 20 mg of the dried residue in 3 ml of thiophene-free benzene carry out the identity test described in the monograph for Phethenylate

Assay (Phethenylate) Thus far no satisfactory chemical method has been developed for the assay of this dosage form due to interference from other ingredients The manufacturer utilizes the following infrared spectroscopic method Shake the suspension thoroughly Transfer to a 125 ml separatory funnel an amount accurately measured equivalent to about 50 mg of phethenylate Add 5 ml of 0 1 *N* hydrochloric acid and then 25 ml of water Extract the solution thus formed with exactly 50 ml of chloroform Draw off the chloroform extract into a small glass stoppered flask containing a little anhydrous sodium sulfate Place the dried extract in a rocksalt cell with a 1 mm light path Record the spectrum between 5 4 and 5 8 μ on a Baird Infrared Recording Spectrophotometer A using chloroform in a 1 mm reference cell as a blank. The percentage of phethenylate present = 100 (absorbancy at 5 72 μ — 0 016) ÷ 0 407 where 0 016 is a correction for absorption at 5 72 μ by substances other than phethenylate and 0 407 is the absorption at 5 72 μ of a chloroform solution containing 1 mg /ml of phethenylate The amount of phethenylate present is not less than 90 0 nor more than 110 0 per cent of the labeled amount.

Oral Suspension Thiantoin 475 cc bottles A suspension containing approximately 24 mg of phethenylate (equivalent to 26 mg of phethenylate sodium) in each cubic centimeter Eli Lilly & Company, Indianapolis

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

COUNCIL APPOINTMENTS

The Board of Trustees has appointed Dr Ralph E DeForest, Rochester, Minn, as Secretary of the Council on Physical Medicine and Rehabilitation A graduate of Wayne University College of Medicine, Dr DeForest also holds a master of science degree in physical medicine and rehabilitation from the University of Minnesota, where he did research on the effects of ultrasound on growing bone He has been a fellow in orthopedic surgery and in physical medicine and rehabilitation at the Mayo Foundation and has served with the Army Medical Corps in occupied Germany His appointment became effective August 1 Howard A Carter, former secretary of the Council, has been made director of biophysical investigation and associate secretary of the Council Dr Frederick T Jung, assistant secretary of the Council, has been appointed director of the new physical laboratory

THE USE OF NEW DRUGS

Until recent years the use of drugs has been accompanied by comparatively few worries concerning toxic reactions An overdose might kill, but usually the difference between the average dose and a fatal dose was large Not often did a patient react unexpectedly, except when a certain group of drugs was used or unless the patient was unusually sensitive to a drug Today, however, the situation is different Potent and specific drugs have been developed, their effects are sometimes unpredictable, and in some cases death has followed their use Physicians thus are asked sometimes whether modern drug therapy is safe, whether the probable outcome is worth the risk Perhaps the simplest way to answer such questions is to say that modern drug therapy sometimes produces seeming miracles, that without it countless lives would be lost and untold suffering continued At the same time it can be pointed out that, with adequate precautions and safeguards, the use of drugs is not normally a dangerous procedure Of course, physicians must admit more to themselves if accidents are to be prevented They must appreciate that unexpected and unfavorable reactions can occur in spite of exhaustive research prior to the release of a new drug, that individuals react differently and often unpredictably, and that sometimes truly questionable drugs must be used when heroic measures are indicated The careful physician uses a drug only when he knows what it can be expected to do and when he is convinced the patient needs it He then is willing to admit that, while a risk may be involved, the risk is slight when compared to the comfort the drug provides No one would deny the use of the sulfonamides or the antibiotics because they can cause worrisome reactions Their value is too well demonstrated to warrant their discard because of clinical disturbances in some patients Physicians versed in the use of drugs realize that far more harm is done by the misuse of drugs than by the occasional use of a drug that carries with it some risk

Elsewhere in THE JOURNAL (page 17) is a report on the use of a new drug (phenacemide) for epilepsy This drug can be dangerous unless properly employed and even then is not completely free of danger One might ask, then, whether the drug should be released for general use The answer lies, in part, in careful supervision of the administration of the drug, in the medical profession's employing it only after it is fully informed, and in restricting the sale to prescription use The answer also lies, in part, in consideration of the value of the drug Does its usefulness outweigh its disadvantages? To determine this, the prescriber must keep in mind the amount of research that first was compiled by able investigators, the seriousness of epilepsy, and the reactions that have always attended drug therapy for epilepsy Even the best known drugs, including those in New and Nonofficial Remedies, have not been free of toxic properties If the prescriber is convinced that the drug has special usefulness and that he understands the actions and uses, he can use it, if he is not convinced, he should avoid its use Clinical judgment determines the attitude that should be taken toward the risk involved

Another situation of interest in this perplexing aspect of drug therapy concerns the development of unexpected reactions Not infrequently a drug is released for interstate commerce after years of laboratory and clinical research and with hope that all pharmacologic properties are known Then suddenly there appears a report, or several, of, for example, agranulocytosis Does this mean the drug should be withdrawn from the market? Again the risks and the potential usefulness must be considered Within the last few days, word has been received of three cases of agranulocytosis following the use of procaine amide, which has been proposed for conditions in which quinidine is effective One wonders whether this provides sufficient excuse for deletion of the drug from the medical armamentarium or whether it is in the same class as, for example, the sulfonamides and propylthiouracil—too useful for discard but not so free of toxic properties that carelessness can ever be permitted The evidence at this time seems to support the latter approach

Physicians today have remarkable tools with which to practice medicine But, as is true of all tools, improper use is attendant with danger If there is an unusual risk associated with the use of a drug, but the physician is convinced the drug is necessary for, or at least best suited to, a patient, he should accept the risk as a challenge by which he cautiously approaches his clinical problem To indict a drug or all drug therapy because occasional reactions are seen is unfair to patients who might benefit therefrom However, he cannot afford, for his patient's welfare or his own reputation, to use a drug with which he is not familiar or which he believes is too dangerous for his practice In the final analysis, his decision must rest on his knowledge and experience and on sound judgment

INTERNATIONAL SANITARY REGULATIONS

On May 25, 1951, the Fourth World Health Assembly unanimously approved the new WHO Sanitary Regulations No 2 These regulations, which were approved by 64 member-states of the WHO, provide for the first time a single set of rules concerning international traffic Governments now have nine months in which to make reservations, which may or may not be approved by the Fifth World Health Assembly The regulations will then go into force in all countries concerned on Oct 1, 1952 In reality, that will mean all countries other than those of the communist block

The system of international sanitary regulations has already been tried in connection with the international classification for diseases and causes of death, but mortality statistics are less controversial and have less economic consequence than international traffic regulations

It took exactly a century for the national health administrations to arrive at this state of development of international relations The first international sanitary conference met in Paris in 1851 Like the subsequent international sanitary conferences held during the next 40 years in various capitals, ranging geographically from Constantinople to Washington, it dissolved with no other result than posing the problem and keeping it alive in the minds of the governments The first real international sanitary convention that came into effect was that of 1893 Attempting to keep abreast with the progress of medical science, other conventions followed, notably the International Sanitary Conventions of 1903, 1905, 1912, and 1926, the Pan American Sanitary Convention of 1905, the Pan American Sanitary Code of 1924, the International Sanitary Convention for Aerial Navigation of 1933, and the Sanitary Conventions of 1944

Except for the Pan American Sanitary Code, the conventions were ratified only by a limited number of the countries concerned At present, 13 major sanitary conventions, ranging in time from 1903 to 1946, are in force for various countries while some countries have never signed any conventions, thus adding greatly to the confusion of all sanitary measures that can be taken in regard to international traffic All these conventions, with the exception of the Articles of the Pan American Sanitary Code referring to subjects other than the pestilential diseases, will now be superseded by the new WHO regulations

The first draft of the regulations was prepared by the WHO Expert Committee on Epidemiology and Quarantine This draft was sent to all governments for comment The comments were, as far as possible, embodied in the new draft, which was then submitted to the special committee constituted by the Third World Health Assembly This committee met in Geneva from April 9 to May 5, 1951 There were official delegations from 34 countries at the session

The Fourth World Health Assembly meeting in Geneva, on May 7, 1951, reconstituted the committee as a committee of that Assembly, thus enabling all the 64 governments represented at the Assembly to participate in the deliberations Last-hour changes were made to satisfy those who had previously been absent, and on May 25 the regulations were approved by the Assembly without dissent

The new regulations recognize that complete protection against the introduction of pestilential diseases depends on the eradication of the existing foyers Until such eradication is achieved, there is a continuing danger of their spread The regulations define maximum measures that may be applied when necessary and are in general less restrictive on international traffic than the former conventions It is expected that greater security against the spread of infection will be attained with fewer restrictions on international traffic

One fundamental principle of the regulations which was successfully promoted by the American delegation was that complete information regarding the occurrence of any case of a pestilential disease must be promptly available from all parts of the world The duty of reporting has, therefore, been extended, and the WHO Epidemiological Intelligence has been greatly strengthened At present, many restrictive quarantine measures are solely due to the lack of immediate and reliable information regarding the occurrence of smallpox and murine plague

The American delegation also insisted that proper machinery should be set up for current review of the functioning of the regulations Such reviews have not hitherto been available, nor has there been any competent authority for analyzing the information available An appropriate committee to be set up for this purpose within the WHO should make it possible from time to time to review the regulations in the light of acquired experience Unnecessary restrictions might thus be removed, and measures which have been found lacking might be added to the regulations The present regulations refer mainly to plague, cholera, yellow fever, smallpox, typhus, and relapsing fever The Assembly, therefore, decided to set up an appropriate committee to consider additional regulations which may be necessary in regard to other diseases Among the problems yet to be solved is the prevention of international transport of malaria vectors The importance of such control will rapidly increase with the extent of the areas liberated from malaria vectors

The regulations contain provisions regarding the establishment of direct transit areas in airports for accommodating, in segregation, the passengers and crew, thus breaking their voyage without their leaving the airport It is expected that this measure will do away with many of the hindrances to rapid travel by air when the voyage extends over a number of countries Radio pratique has been introduced for the first time in the international agreements for ships and aircraft, which may thus avoid delay by reporting on their sanitary state before arrival

Measures against plague have definitely been centered on the control of rodents rather than on the human cases The delineation of yellow fever endemic zones has been radically changed At present, measures are taken against very large areas in Africa and South America where the virus exists or is known to have existed among jungle animals with no, or only incidental, human cases Under the new regulations, the presence of Aedes aegypti also is required before a locality can be included in the endemic zone It was the belief of the majority of the committee that only the presence of an efficient domestic vector, such as the Aedes aegypti, would make it practically possible to spread the disease beyond national frontiers This provision will greatly reduce the South American yellow fever endemic zone and consequently facilitate aerial traffic in that part of the world

The chapter concerning smallpox was completely rewritten The proposal of the American delegation that any person on an international journey may be required to possess a valid smallpox certificate was adopted So long as smallpox infection exists in so many countries and information is not always readily available regarding its occurrence, it is believed that this measure is necessary in order to limit international spread The smallpox certificate was simplified, on the other hand, so that travelers will not have to wait for the reading of the results of the vaccination It is generally recognized that most of the readings of revaccinations made in various parts of the world are of slight value Instead, it must be stated on the certificate whether a successful primary vaccination or a revaccination is in question

Several articles on measures against typhus were deleted, as they were considered unnecessary in view of the simple methods of control with dichlorodiphenyltrichloroethane (DDT) now available No ship or aircraft will be delayed on account of a case of typhus or relapsing fever on board

Bills of health are abolished Maritime declarations of health, deratting or deratting exemption certificates and vaccination certificates against yellow fever, cholera, and smallpox are the only international documents that may be required Typhus, plague, or other vaccinations may not be required as a condition of entry into a territory The sanitary declaration of an aircraft will be part of the general declaration The proposal of the American delegation to the effect that a vaccination certificate issued to an active member of the armed forces shall be accepted in lieu of an international certificate was adopted The period of validity of the yellow fever certificate was extended to six years The new smallpox vaccination certificate may be used from Dec 1, 1951, for any state which within three months of the adoption of the regulations by the Assembly declares that it does not intend to make reservations in that respect

Today, Southeast Asia lives in deadly fear of the introduction of yellow fever The Near East dreads cholera, and the United States fears smallpox None is protected as it ought to be against these dangers Each part of the world has its own problems Nevertheless, on May 25, 1951, by mutual concessions, 64 free countries agreed on a common text for solving their quarantine problems, and a United Nations specialized agency was appointed executive of the agreement

TRENDS IN CANCER MORTALITY

The Metropolitan Life Insurance Company has recently compared the mortality rates from malignant neoplasms during the periods 1946-1947 and 1949-1950 [1] The over-all percentage change in death rate for white policy holders between one and 74 years of age was an increase of 4% for the males and a reduction of 3% in females The reduction in females occurred chiefly at ages 25 to 74, with only slight changes at ages one to 24 years In the males, there was a decline in mortality at ages one to 14 years and 45 to 74, a small increase at 15 to 24, and an appreciable increase at 24 to 44 Both sexes show a decline in mortality for cancer in accessible sites, reduction being particularly marked for cancer of the uterus in females and cancer of the buccal cavity in males For cancer in inaccessible sites, the mortality rate declined slightly between 1946-1947 and 1949-1950 in females but increased in males Cancer of the respiratory tract and of the pharynx taken together increased 30 4% for males and 10 3% for females, the increases being attributable to some extent to improved diagnostic techniques, increasing alertness of the physician, and use of mass x-ray examinations Both sexes showed an increase in death rate for cancer of the pancreas, while the death rate for cancer of the ovary and other female genital organs increased by about one-sixth In both sexes, however, there was a reduction in mortality from cancer in a number of inaccessible sites, including the stomach, intestines and duodenum, rectum and anus, liver and biliary passages, and bladder The death rate from leukemia increased markedly in both sexes, possibly a reflection of improved diagnosis While the success of the campaign for early recognition and treatment of cancer cannot be judged solely by this report, the reductions in mortality for many sites of cancer are encouraging

MALPRACTICE AND THE PHYSICIAN

Elsewhere in this issue of THE JOURNAL (page 54) appears a special report of the Committee on Medicolegal Problems dealing with malpractice claims The report emphasizes the preventive aspects of the problem and contains many suggestions as to what can be done to reduce the incidence of unjust suits Committees have been created by many state and local medical associations to study the malpractice problem and to assist patients and physicians in adjusting differences that may arise, some of which may be forerunners of litigation Such committees will find this report of significant value, as will also individual physicians Patients who have just grievances should be aided in obtaining proper and prompt adjustments, but many claims, as the report points out, result from a *misunderstanding* of the legal responsibilities involved in the physician-patient relationship The report should serve to clarify an appreciation of these responsibilities Reprints will be made available by the Committee on Medicolegal Problems

SUBLINGUAL ABSORPTION OF HEPARIN

The success of heparin in the treatment of frostbite [1] and the value of initiating such treatment in the field before hospitalization of soldiers led Litwins [2] and associates of Beth Israel Hospital, New York City, to test the possibility of sublingual administration of this drug Wafers containing 125 mg of sodium heparin were placed in the sublingual pouch of 10 volunteers, where they rapidly disintegrated Absorption was usually complete in 10 minutes Periodic determinations of the blood coagulation time showed that in most instances a therapeutically effective prolongation was attained one-half hour after administration of the heparin and maintained for some four hours The New York clinicians believe from their data that sublingual administration of heparin may in time be recognized as a method of choice for the anticoagulant treatment of myocardial infarction, pulmonary embolism, and thrombophlebitis, and in vascular surgery

MEDICAL NEWS

CALIFORNIA

Facilities for the Chronically Ill —San Francisco s Chronic Illness Service Center, organized in 1950, is now on a full time working basis and will assist San Francisco Medical Society members who may have problems among their patients with chronic illness The city is reported to be one of five in the nation which has developed its own Chronic Illness Service Center

COLORADO

Narcotic Violation —Dr George A Glenn, Denver, pleaded *nolo contendere* to all counts in the indictment charging violation of the federal narcotic law On July 11 he was sentenced to serve one year and one day on five counts to run concurrently, and on the sixth count sentence was suspended and he was placed on probation for two years, the probation to begin at the expiration of the sentence on the first five counts

GEORGIA

University News.—Dr Alvin G Foraker and Dr Abner Golden have been promoted from assistant professors to associate professors of pathology at the Emory University School of Medicine, Atlanta Other promotions include Dr Philip Bondy from associate in medicine to assistant professor of medicine, and Dr James F Olley from associate in pathology to assistant professor of pathology

ILLINOIS

Hospital News —Last spring, with appropriate ceremonies ground was broken for the new Memorial Hospital in Marion The new 50 bed hospital will cost about $900,000

Drive on Unlicensed Healers —According to the *Chicago Daily News* C Hobart Engle, new director of the Illinois Department of Registration and Education, has asked all state's attorneys to "crack down" on more than 400 unlicensed healers in Illinois About 100 of these are in the Chicago area The unlicensed practitioners include chiropractors, naprapaths, and naturopaths Each prosecutor has been given a list of unlicensed healers in his county, according to Jack L Sheer, chief attorney for the department

Chicago

Lectures on Biophysical Aspects of Virology.—A series of lectures and demonstrations in the biophysical aspects of virology will be given Sept 20-22 by Dr Max A Lauffer, professor of biophysical chemistry, University of Pittsburgh These lectures are part of the Gehrmann lecture series sponsored by the department of bacteriology of the University of Illinois College of Medicine The following program of lectures will be given at 1 p m each day, followed by a demonstration at 3 p m unless otherwise indicated

Sept 20 Ultracentrifugation at Abbott Hall University of Chicago the use of centrifugation for preparation and characterization of viruses.

Sept 21 Electrophoresis, at the North Amphitheatre Presbyterian Hospital the use of electrophoresis for purification and characterization of viruses

Sept 22 Electron Microscopy 9 30 a m at University of Illinois Research and Educational Hospitals, the use of electron microscopy in the study of viruses 11 a m Room 342 University of Illinois Dental-Medical Pharmacy Building

All interested are invited to attend the lectures, but there will be room for only 20 at the demonstrations All who wish to attend may register by writing to Dr J E Kempf, Department of Bacteriology, University of Illinois, 808 S Wood St , Chicago 12, before Sept 15

Grants for Research —The Hektoen Institute for Medical Research has received the following contributions for research

For investigations by a team headed by Dr Hans Popper, an annual contribution of $16,000 was received from the Dr Jerome D Solomon Memorial Research Foundation for research in liver diseases, from the Atlas Powder Company, $13,250 for the investigation of the influence of emulsifying agents on fat metabolism, from the Nepera Chemical Company, Inc , $3,500 for the study of toxicologic effects of pharmacologic agents, and from the U S Vitamin Corporation, $4,140 for research on the physiological effects of parenteral lipotropic administration For investigations by a team headed by Dr Oscar Felsenfeld, $10,000 was received from the Dr Leonard H and Louis Weissman Medical Research Foundation for research in virus diseases, from the Commercial Solvents Corporation, $12,000 for study of the inhibition of viruses transferable from animals to man, and $12,000 for studies in mycology and parasitology, and from the Eaton Company, $11,000 for further studies of nitrofurans For investigations by a team under Dr Steven O Schwartz, $5,000 was received from the Olivia Sue Dvore Foundation, $1,800 of which will be used for a research fellow in hematology and the balance for research on leukemia, and from the Edward Friedman Leukemia Fund, $3,000 for the continuation of research on leukemia For investigations on breast carcinoma by a team headed by Dr Louis P River, an annual allocation of $7,500 has been made by the Dr Jerome D Solomon Memorial Research Foundation The Karl A Meyer Fellowship of the foundation, held by Dr Hyman S Lans, has been awarded for another year for research in potassium metabolism in surgical conditions

INDIANA

Faculty Appointments.—Twenty six members of the faculty of the Indiana University School of Medicine, Indianapolis, have been advanced in academic rank by the board of trustees The promotions included the conferring of the title of professor emeritus in proctology on Dr Joseph W Ricketts, professor emeritus in genitourinary surgery on Dr Arthur F Weyerbacher and Dr Homer G Hamer, and associate professor emeritus in pediatrics on Dr J Don Miller Advanced to fill vacancies in departmental chairmanships were Dr Marlow W Manion, named professor of otolaryngology and chairman of the department of otorhinolaryngology and broncho-esophagology, and Dr Lyman T Meiks, named chairman of the department of pediatrics and professor of pediatrics Dr Manion, a member of the staff for 21 years, succeeds Dr Carl H McCaskey, who retired a year ago after 29 years on the faculty Dr Meiks succeeds Dr Matthew Winters as chairman of the department of pediatrics, a post which Dr Winters had filled with distinction for 20 years Dr Meiks has been a member of the medical school staff since 1931 and has served as full-time pediatrician at the James Whitcomb Riley Hospital for Children Dr Edward B Smith, St Louis, has been appointed professor of pathology He served for two years as an instructor in pathology at Washington University, St Louis, before entering the Army Medical Corps in 1942 After leaving the army in 1946 Dr Smith was on the pathology staffs of the University of Pennsylvania, Philadelphia, and Baylor University, Houston

IOWA

Dr Gilman Wins Chemistry Award —Henry Gilman, Ph D , professor of chemistry at Iowa State College of Agriculture and Mechanical Arts at Ames, has won the 1951 Iowa Award, given by the Iowa Section of the American Chemical Society for meritorious work in research, teaching, or industry The medal will be presented to Dr Gilman at a dinner in Iowa City on Dec 7 In addition to war research on antimalarials, Dr Gilman has done work on the relationship between the physiological action and the chemical constitution of local anesthetics, antibiotics, hypnotics, and analgesics

---

Physicians are invited to send to this department items of news of general interest for example those relating to society activities new hospitals education and public health Programs should be received at least three weeks before the date of meeting.

KANSAS

Public Health Appointments.—Dr Thomas R Hood, formerly director of the Topeka-Shawnie County Health Department, was appointed executive secretary of the Kansas State Board of Health, effective Aug 1 Dr Robert H Riedel, who had accepted a temporary appointment to this position, has returned to his regular work as director of the Division of Cancer Control Dr Floyd C Beelman, former executive secretary, resigned in May to take up defense work in Washington, D C Dr H R. Wagenblast of the Wichita-Sedgwick County Health Department, is the new director of the Lawrence Douglas County Health Department in Lawrence

Teacher Training Program for the Deaf.—September 4 will initiate a new one year teacher training program for the deaf at the University of Kansas Medical Center, Kansas City Although the state has had some type of school for the deaf since 1861, it has been necessary to hire teachers trained in one of the 19 other schools in the country offering certified training programs for teachers of the deaf At present, only about one-fourth of the hard-of-hearing children in Kansas are being helped in any way A recent survey of school children in Leavenworth, initiated by Dr LaVerne B Spake, Kansas City, showed almost 6% were hard-of hearing This means that in the state of Kansas 28,197 children are probably hard-of-hearing Lack of teachers has prevented any expansion of aid to them The new teacher training program will utilize the combined facilities and members of the faculties of the university s school of education, the Kansas School for the Deaf at Olathe, and the hearing and speech department of the medical center Entrance requirement is a bachelor s degree in education At the conclusion of the course registrants will receive a master's degree in education. They will also be eligible for certification by the Conference of Executives of American Schools for the Deaf

LOUISIANA

Dr Kilbourne to Direct Division.—Dr Edwin D Kilbourne, New York, has been appointed associate professor of medicine and director of the division of infectious disease at Tulane University of Louisiana School of Medicine in New Orleans He comes to Tulane from the hospital of the Rockefeller Institute for Medical Research, where he was assistant physician. The division of infectious disease plans to build up basic research in the department, with emphasis on virus diseases.

MISSOURI

Postgraduate Course for General Practitioners—The St Louis Academy of General Practice in cooperation with Washington University will hold its second postgraduate course for general practitioners beginning Sept. 18 The course consists of lectures from 8 to 10 a m , Tuesday and Thursday, for six weeks It affords 24 hours of formal postgraduate study, accredited by the Committee on Education of the American Academy Over one hundred general practitioners are now registered

NEW YORK

Society News—Dr Samuel W Moore, New York, will speak on "Pathology and Complications of Acute Cholecystitis" before the Jefferson County Medical Society at 6 30 p m Sept 18 at the Black River Valley Club in Watertown

Hospital News.—St James Mercy Hospital, Hornell, on July 15 opened its new million dollar wing which was begun in the fall of 1949 The hospital now has a 145 bed capacity and such new departments as a postoperative recovery room, a complete cystoscopy department, and a completely new surgical department that includes three major operating rooms and an eye, ear, nose, and throat operating room

State Hospitals Appointments—Dr Francis J O'Neill has been appointed senior director of Central Islip State Hospital and Dr Bascom B Young director of Utica State Hospital, effective Aug 1 Dr O'Neill s appointment is a promotion from his position as director of Utica State Hospital Dr Young, present assistant commissioner of mental hygiene, will assume the directorship left vacant by Dr O'Neill s transfer

New York City

First Harvey Lecture.—Dr A R Todd, professor of chemistry, University Chemical Laboratory, Cambridge, England, will deliver the first Harvey Lecture of the current series at the New York Academy of Medicine on September 27 on The Nucleotides Recent Chemical Research and Its Biological Implications "

Two-Year Course in Psychotherapy—The Group Psychotherapy Institute will now offer, in addition to seminars, a two-year consecutive course that will include one year of preliminary training and one year in group psychotherapy The courses will be offered for five hours a week for 30 weeks of each year, and the time of day will be arranged to suit the participants. The number of students will be limited to 20, and preference will be given to psychiatrists, psychiatric caseworkers, and clinical psychologists engaged in individual or group psychotherapy, especially in an agency or hospital setting The tuition is $150 per year For information write to Group Psychotherapy Institute, Inc., 105 E 22 St., New York 10

Efficiency Study for Municipal Hospitals—The Hospital Council of Greater New York, at the request of the department of hospitals, is undertaking a study of the types of patients and the different facilities and programs available for acute, chronic, and convalescent cases in municipal hospitals The study, made possible through a grant from the New York Foundation, is to be completed early next year Dr Marcus D Kogel, hospital commissioner, said that the Board of Hospitals believes that more effective planning for the future of hospitals of the department could be made after pertinent information was available concerning types of patients and the factors that influence prolonged hospital stay It is also planned to analyze the services required by patients currently under care to determine the facilities and services which should be provided The hospital council will evaluate the relative cost of providing hospital care for acute and chronic illness in patients Outpatient services will also be studied in their relation to more effective use of convalescent institutions

Graduate Fortnight.—The New York Academy of Medicine in cooperation with the New York Heart Association will present its 24th Graduate Fortnight Oct 8-19 on Disorders of the Circulatory System Evening sessions beginning at 8 30 p m in the New York Academy of Medicine will be addressed by the following guest speakers

Herrman L. Blumgart Boston Coronary Disease Clinical Pathologic Correlations and Physiology
John W Gofman Berkeley Calif Diet and *Lipotropic Agents in* Atherosclerosis
Albert Szent-Gyorgyi Woods Hole, Mass Contraction in Heart Muscle
Lewis Dexter Boston, Dynamics of Acquired Valve Lesions
Eugene A. Stead Jr Durham N C Edema and Dyspnea of Heart Failure.
Louis N Katz, Chicago Importance of Cardiac Arrhythmias
Irvine H Page *Cleveland Renal* and Vasomotor Factors in Hypertension.
Merrill C Sosman, Boston Roentgen Diagnosis in Cardiovascular Disease
Thomas H. Hunter St. Louis Treatment of Bacterial Diseases of the Heart and Pericardium

Morning panel discussions will be held at the academy on Oct 9, 12, 16, and 19 There will be hospital clinics each day from 2 to 5 p m Registration fee for those not members of the academy is $10

NORTH CAROLINA

Dr Sawyer Goes to California.—Charles H Sawyer, Ph D , professor of anatomy at The Duke University Medical School, Durham, and a member of the faculty since 1944, this fall will become professor of anatomy at the new University of California at Los Angeles School of Medicine Before joining the Duke staff Dr Sawyer had taught at Yale and Stanford universities

Dr Burnett to Head Department of Medicine—Dr Charles Hoyt Burnett, professor and chairman of the department of internal medicine, Southwestern Medical School of the University of Texas, Dallas, becomes professor and head of the department of medicine at the University of North Carolina, in Chapel Hill in September Other new appointments to the staff of the school of medicine include the following Dr William J Cromartie as associate professor of bacteriology and director of the bacteriological laboratory in University Hospital, Dr Charles B Taylor as associate professor of pathology, Basil L Truscott, Ph D, as assistant professor of anatomy and Drs Clarence M Miller Jr and James B Caulfield as fellows in pathology

Training Center for Premature Infant Care.—The Duke University will become North Carolina s first training center for premature infant care this fall Public health nurses and graduate nurses in hospitals throughout the state will be trained in caring for premature babies at the Duke School of Nursing The North Carolina Premature Care Program, administered by the State Board of Health through the pediatric consultant, Dr Robert J Murphy, is sponsored by the North Carolina Pediatric Society For two and one half years the state program has sponsored six service treatment centers in North Carolina hospitals but has had no facilities for training nurses The plan may be expanded for training physicians later on Deaths in the six hospital service centers have been cut in half since the program was begun two and one half years ago, spokesmen said Service centers are located at Duke and Watts hospitals, Durham, Rex Hospital, Raleigh, North Carolina Baptist Hospital, Winston-Salem, James Walker Memorial Hospital, Wilmington, and Victoria Hospital, Asheville There are now more than 8,000 premature infants born in North Carolina every year, and about 4,000 need care at special hospital centers

OREGON

Constitutional Make-Up and Disease—The University of Oregon Medical School, through a grant of $100,000 from the Rockefeller Foundation, New York, will participate in an intensive study of the relation between physical make up and disease The study will be organized by Dr William H Sheldon of Columbia University College of Physicians and Surgeons and the head of the college s constitutional laboratory Dr Sheldon is said to expect it will take two generations to complete the study In establishing physical categories he and his co-workers and assistants have photographed more than 100,000 persons Members of the department of medicine of the medical school will cooperate

PENNSYLVANIA

Regional Meeting of Pathologists.—The Pennsylvania Association of Clinical Pathologists, the Clinical Pathological Society of Pittsburgh and the Middle Eastern Regional Committee of the College of American Pathologists will meet at the Roosevelt Hotel in Pittsburgh Sept 14-15 A slide seminar on "The Pathologic Anatomy of Virus Diseases opens the morning session Sept 14 Slide sets can be reserved by registrants who pay the slide seminar registration fee of $5, which should be forwarded to Dr Elwyn L Heller, Department of Pathology, University of Pittsburgh, Pittsburgh 13 The seminar will be moderated by Dr Heller, and Dr John P Wyatt, professor of pathology, St Louis University School of Medicine, will serve as referee A social hour and informal dinner are scheduled for Friday and Saturday evening at the Roosevelt Hotel There will be a business meeting of the Pennsylvania Association of Clinical Pathologists Sept 16

Philadelphia

Personal—Dr Archer P Crosley Jr, assistant instructor of medicine at the University of Pennsylvania School of Medicine, has been appointed a staff physician in the medical division of Sharp & Dohme, Inc

TENNESSEE

Cancer Research Laboratory.—The University of Tennessee Medical Unit s Cancer Research Laboratory has been added to the medical center in Memphis Funds for the building completed at a cost of $499,088, were made available by the National Cancer Institute of the United States Public Health Service

General Practice Clinic.—Dr Paul S Williamson, general practitioner of Vernal, Utah, will be the director of the new Family General Practice Clinic to be established by the University of Tennessee College of Medicine in the outpatient department of John Gaston Hospital in Memphis, and opened Sept. 27 The clinic marks a departure from the trend to specialization in medicine It will stress for graduating medical students the idea of "family practice Tennessee is in need of family practitioners Dr Williamson has been engaged in general practice at Vernal since 1947 The clinic will be operated under the division of preventive medicine

TEXAS

New Laboratory—A tissue metabolism research laboratory has been established at the University of Texas Medical Branch, Galveston under the direction of Wiktor W Nowinski, Ph D, associate professor of neurochemistry The laboratory will be devoted to clinical research concerned with tissue metabolism in the treatment of burns, and in the promotion of repair and regeneration

Reprint on Yellow Fever Epidemics.—The University of Texas Press is arranging for the publication of a reprint of Dr Ashbel Smith s account of the yellow fever epidemic in Galveston in 1839 The reprint is being prepared with a biographical sketch of Dr Smith and a general account of the development of knowledge regarding the control of yellow fever Dr Smith

(1805-1886) was a founder of the University of Texas and first chairman of the board of regents He had previously served as dean of the Texas Medical College in Galveston, which preceded the University of Texas Medical Branch

VIRGINIA

Society Honors Managing Editor.—The August issue of the *Virginia Medical Monthly,* by order of the council of the Medical Society of Virginia, is dedicated to Miss Agnes V Edwards and her father, both of whom have been and were long associated with the publication Dr Landon B Edwards started the monthly as a private enterprise in 1874, passed it to his son, Dr Charles M Edwards, on his death in 1910, and when the latter went to war Miss Edwards took over and has managed it since that time In 1924 she was officially elected business manager and executive secretary of the Medical Society of Virginia, which had purchased the journal in the fall of 1919 The medical society dedicated the August issue to her as an expression of appreciation for her work

WEST VIRGINIA

Board Elections.—Dr William M Jarrett, Charleston dentist, was re-elected chairman of the state board of health at the meeting held in Charleston June 29 He will serve for an additional two years Dr Walter E Vest of Huntington was re-elected chairman of the Medical Licensing Board for a two year term He was the first chairman of the board, organized July 1, 1949 He had previously served for 12 years as president of the old public health council, which was replaced by the licensing board The fall meeting of the Medical Licensing Board will be held at the Capitol in Charleston, Oct 1-3, for the purpose of examining applicants for licensure to practice in West Virginia

Medical Press Radio Code—The Doctor-Press Radio Code of Ethics, prepared by a committee composed of Dr E Lyle Gage, Bluefield, representing the West Virginia State Medical Association, and Francis P Fisher and George Clinton of Parkersburg, representing, respectively, the State Newspaper Council and the State Broadcasters' Association, was formally adopted by the State Newspaper Council at a meeting at Spencer July 27 The code had the unanimous approval of representatives of the press, radio, and medical profession who attended the annual press radio conference sponsored by the state medical association, held at Charleston Jan 28 It had been approved previously by the council of the state medical association, and it was approved by the West Virginia Broadcasters' Association at a meeting held last spring

WISCONSIN

Funds for Cancer Research—The University of Wisconsin regents have accepted a grant of $45,000 for cancer research from the estate of the late Mrs Mary E Stewart, former Wausau resident Mrs Stewart, daughter of the late Alexander Stewart, who was a pioneer lumberman in the Wausau area, willed her estate of nearly $5 million to her sister, with the provision that after the sister s death the money was to be used for cancer research The sister has released the funds for current use in cancer research McArdle Memorial Laboratory, university cancer research center, already has benefited from the Stewart estate by grants of $30,000 in December, 1949, and $15,000 in July, 1950 The present $45,000 grant is now available for use The money is used to pay the salaries of some of the younger key staff people and to purchase supplies and apparatus

WYOMING

Blood Typing and RH Testing Program.—In response to requests by Wyoming physicians, and as an addition to the Division of Maternal and Child Health Services, the state board of health at a recent meeting approved the initiation of a state wide program for the routine blood typing and Rh testing of all prenatal blood specimens sent to the Wyoming Public Health Laboratory in Cheyenne This program began August 1 The laboratory has been performing Rh tests on blood specimens sent in special containers but has not done blood typing The new Rh and blood typing program will require only a single clotted blood specimen for an Rh test, blood typing, and prenatal serologic test for syphilis As planned this new service will be limited strictly to obstetrical cases, except that Rh tests will be performed on husbands of Rh negative women on special request

GENERAL

Survey of County Chronic Diseases Programs.—In a recent survey of activities of 757 county medical societies, the following programs related to chronic diseases were reported

Five hundred and forty five county medical societies participate in tuberculosis control programs, and 533 in cancer control programs, and 367 cooperate in a diabetes control program, and 149 in a rheumatic fever control program Seventy-six county medical societies reported that they are experimenting with multiphasic screening The survey was made by the Council on Medical Service of the American Medical Association

Alcohol Committee Enlarges Scope—The National Committee on Alcohol Hygiene, Inc, with national headquarters in Baltimore, has enlarged its scope of education to include the expanding American social ills of today Besides educational reports on alcoholism and alcoholics, the committee will disseminate scientific articles for the laity on dope and drug addiction, crime and criminality, and psychological sexual illnesses and divorce The first report, now available for distribution, is titled "How to Help an Alcoholic" The second report will be issued also in booklet form in September entitled "The Dope on Dope" The executive director of the committee is Dr Robert V Seliger, Baltimore

Dr Hartley to Edit Northwest Medicine—Dr Herbert L Hartley, Seattle, has been named editor-in-chief of *Northwest Medicine,* succeeding Dr Clarence A Smith Dr Smith, who helped to found the medical journal in 1901 and who observed his 90th birthday anniversary in January, was named editor emeritus The journal is the official publication of the state medical associations of Washington, Oregon, Idaho, and Alaska Dr Hartley, who has practiced in Seattle for 19 years, was graduated from the University of Iowa Medical School in 1928 He served in the Navy Medical Corps for four years during World War II The new editor is a member of the publication committee of *GP,* the journal of the American Academy of General Practice

The Cardiac in Industry—The Joint Committee on the Cardiac in Industry has held its first meeting in New York to consider problems of education, research, rehabilitation, and employability of workers with heart disease The committee was set up by the American Heart Association Its chairman is Dr Leonard J Goldwater, professor of industrial hygiene, Columbia University School of Public Health, New York. Other members are Drs Rufus B Crain, medical director, Eastman Kodak Company, Rochester, N Y, Edward M Kline, medical consultant, General Electric Company, Cleveland, Leo Price, director, Union Health Center, International Ladies' Garment Workers' Union, New York, Brandt F Steele, internist and psychiatrist, Philadelphia, and James V Warren, physiologist, Emory University School of Medicine, Atlanta

Markle Scholar Nominations—The John and Mary R. Markle Foundation invites deans of medical schools in the United States and Canada to make nominations for the fifth group of Scholars in Medical Science on or before Dec 1, 1951 Each school may nominate one candidate Candidates should have completed the usual fellowship training in some area of science related to medicine and should hold, or expect to hold, in the academic year 1952-53 a full time faculty appointment on the staff of a medical school The grants are not intended for support of interns or residents, or for those considered by the faculty as advanced students still in training. Grants of $30,000, payable at the rate of $6,000 annually, will be made to the schools over a five year period toward the support of each scholar and his research The number of scholars to be appointed in 1952 has not yet been determined Twenty were named in 1950 and in 1951 A new booklet about the plan with suggestions for making nominations, is available on request from the foundation, 14 Wall St, New York 5

Obstetric Seminar.—This seminar, annually sponsored by the Medical College of Georgia and the bureaus of maternal and child health of the South Carolina, Georgia, and Florida state health departments, will be held at the Sheraton Plaza Hotel, Daytona Beach, Fla , Sept 10-12 The meeting is approved for credit hours by the American Academy of General Practice Visiting lecturers include Dr R Gordon Douglas, professor of obstetrics, Cornell Medical School, New York, Dr Edith L Potter, associate professor of pathology, University of Chicago, Dr Francis B Carter, professor of obstetrics The Duke University, Durham, N C , Dr Carl Huber, professor of obstetrics and gynecology, Indiana University, Indianapolis, Dr Fred L Adair, Mary Campu Ryerson emeritus professor of obstetrics and gynecology, University of Chicago, and Dr Charles C Chapple, associate professor of pediatrics, Hospital of the University of Pennsylvania, Philadelphia There is no registration fee Programs are available on request at the Georgia Department of Public Health

Annual Meeting on Gastroenterology—The National Gastroenterological Association will hold its meeting at the Drake Hotel in Chicago Sept 17-19 The program will include a symposium on peptic ulcer, in which Dr Andrew C Ivy, Chicago, will present the physiological aspects Dr David J Sandweiss of Detroit, the medical aspects, and Dr Lester R Dragstedt of Chicago, the surgical aspects There will also be symposia on the pancreas, psychosomatic medicine, and carcinoma and other individual papers Other speakers include Drs C Wilmer Wirts and Garfield G Duncan, Philadelphia, Dr Charles P Rhoads, New York, Dr R Russell Best, Omaha, Drs Sidney A Portis and Walter L Palmer, Chicago, and Dr Fred J Hodges, Ann Arbor, Mich Immediately following the convention, from Sept 20 to 22, the association will conduct a course in postgraduate gastroenterology at the Drake under the direction of Drs Owen H Wangensteen, Minneapolis, and Isadore Snapper, New York Further information may be obtained by writing to the Secretary, National Gastroenterological Association, 1819 Broadway, New York 23

Chest Physicians Essay Award—The Board of Regents of the American College of Chest Physicians offers a cash prize award of $250 to be given annually for the best original contribution, preferably by a young investigator, on any phase relating to chest disease The prize is open to contestants of other countries as well as those residing in the United States The award, together with a certificate of merit, will be made at the annual meeting of the college Second and third prize certificates will also be given All manuscripts submitted become the property of the American College of Chest Physicians and will be referred for consideration to the editorial board of the college journal, *Diseases of the Chest* The college reserves the right to invite the winner to present his contribution at the annual meeting Five copies of the manuscript, typewritten in English, should be submitted to the executive office, American College of Chest Physicians, 112 E Chestnut St., Chicago 11, not later than April 1, 1952 The only means of identification of the author or authors should be a motto or other device on the title page, and a sealed envelope bearing the same motto on the outside enclosing the name of the author or authors

Vitamin Foundation Grants Awarded—Nine new grants for research in nutrition have been awarded by the National Vitamin Foundation, which makes grants for research semiannually Among the grants were the following Max K Horwitt, Ph.D , State Hospital, Elgin, Ill , was awarded $5 000 for the continuation of studies of nicotinic acid (niacin) deficiency in man and of the possible interrelationships between nicotinic acid, tryptophan, and riboflavin Nevin S Scrimshaw, Ph D Rochester, N Y , director of the division of nutrition for the Pan American Sanitary Bureau, was awarded $8,000 for the continuation of studies on the effectiveness of vegetable protein supplemented by synthetic vitamin B_{12} on the growth and development of undernourished children Drs Robert W Heinle and David R Weir, Western Reserve University, Cleveland, were awarded $6,000 for the continuation of studies on the hematopoietic role of vitamins of the B group in normal and pathological conditions of animals and human beings. Earle W McHenry, Ph D , University of Toronto, Canada, was awarded $9,600 for the study of the relation of vitamin B_6 (pyridoxine) to protein metabolism Dr C Lockard Conley, Johns Hopkins University, Baltimore, was awarded $5,000 for the study of the absorption, utilization, and excretion of vitamin B_1

Catastrophic Accidents—Disasters in which the list of dead tallied 100 or more occurred 13 times in the United States during the 1941-1950 decade, Metropolitan Life Insurance Company statisticians report The highest toll was wrought by the Texas City fire and explosion of April, 1947, in which 561 lives were lost. Next highest in number of deaths were the 1942 night club fire in Boston, killing 492, and the explosion of two ammunition ships at Port Chicago, California, in 1944, which cost 322 lives The other ten disasters in which 100 or more died are the following

	Dead
Hartford Conn circus fire 1944	168
Texas and Oklahoma tornado 1947	167
Pennsylvania West Virginia and Maryland tornado 1944	159
Cleveland Ohio gas tank explosion 1944	130
Oklahoma Missouri and Arkansas tornado 1945	119
Atlanta Ga hotel fire 1946	119
Southern and Midwestern States tornadoes 1942	111
Centralia Ill coal mine explosion 1947	111
New York Bay N Y destroyer explosion 1944	100
Northeastern United States, wind and snow storm 1950	100

From a continuing study of accidents in which five or more lives are lost, the statisticians note that there have been more such accidents during the post-war years than during the war years, but the number of deaths has been lower From 1941 to 1945 there were 482 catastrophes costing 6,801 lives, but from 1946 to 1950 there were 568 such accidents with a combined death toll of 6,412 Deaths from military aviation were not included in the study Occurring most frequently, the statisticians report, are conflagrations, burns, and explosions, with motor vehicle accidents ranking second

Report of Research Fund—The Jane Coffin Childs Memorial Fund for Medical Research announces that in a total of $254,587 for support of cancer research projects and fellowships, grants of $10,000 and over were made as follows Dr Harry S N Greene Yale University, New Haven, Conn , $76,392 for three years for the biological study of cancer Edward L Tatum Ph D , Stanford University School of Medicine, San Francisco, $15,000 for three years for studies on biological and enzymatic effects of chemical carcinogens in inducing mutations, Yale University School of Medicine, $10,000 for one year for maintenance of the new animal house, Dr Leon L Miller, University of Rochester School of Medicine and Dentistry, $45,000 for three years for studies of protein synthesis as related to neoplastic growth, Dr Heinz Herrmann, University of Colorado School of Medicine, Denver, $24,500 for three years for studies on the incorporation of radioactive tracer substances into fractions of developing muscle tissue, and Charles W Hooker, Ph D , University of North Carolina School of Medicine, Chapel Hill, $12,000 for three years for studies on testicular tumors in mice and the problem of the nature of the tumor cell Grants of $5,000 to $10,000 include Dr Alexander Haddow and his associates, Chester Beatty Research Institute of the Royal Cancer Hospital, London, England, $5,000 for a year for investigations on the chemistry, virology, and chemotherapy of cancer, William U Gardner, Ph D , and John J Trentin, Ph D , Yale University School of Medicine, $5,500 for one year for studies on the endocrine physiology of the growth and function of the mammary gland, lactation, and experimental tumorigenesis, Dr Henry D Hoberman, Yale University School of Medicine, $9,900 for one year for investigations on the rates of formation of nuclear and cytoplasmic proteins, Dr Henry S Kaplan, Stanford University School of Medicine San Francisco, $7,150 for one year for studies on the factors controlling growth and metastasis of transplanted tumors, and Dr Martin Lubin, Massachusetts Institute of Technology, Cambridge, under the guidance of Francis O Schmitt, Ph D , $5,500 for one year

Prevalence of Poliomyelitis—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States in the weeks ended as indicated

Leff, formerly director of professional services in the Air Surgeon's office at Headquarters Central Air Defense Force, Kansas City, Mo., has been reassigned to Larson Air Force Base, Washington, where he will assume command of the Base Medical Group and be in charge of a 75 bed hospital. A rated Flight Surgeon, Major Leff is a graduate of the Medical Field Service School and the AAF School of Aviation Medicine.

Office of Surgeon General Moves to New Location.—The Office of the Surgeon General of the Air Force has moved from the Pentagon to Temporary Building No. 8, at 3800 Newark St., Northwest. The building is located in the northwest section of Washington, just off Wisconsin Avenue at the corner of 39th and Newark streets. The new telephone code number is 192 (ORdway 9600). Mail and telegraphic address remains the same as before: Headquarters, USAF, Washington 25, D. C.

Training in Survival.—How to live off the land in isolated mountain strongholds and arctic wastes was the subject of a recent talk at the Randolph Field School of Aviation Medicine by Maj. George R. Steinkamp, surgeon of the Strategic Air Command's survival school at Camp Carson, Colo. Major Steinkamp spoke to the current class of aviation medical examiners at the aero medical school. Flyers in modern long range bombers are likely to find themselves in wild and unfriendly places if they have to bail out or are forced down. To show them how they can maintain themselves in unfamiliar surroundings until rescuers reach them is the purpose of the survival school. Air crewmen at Camp Carson are taught survival procedures under conditions that closely simulate those of an actual emergency. Major Steinkamp exhibited to the student officers—some of whom may find themselves in B 36 squadrons later on—the special equipment which SAC researchers have designed to help airmen take care of themselves in the wilds. With these lightweight survival kits a downed crew member can build his own shelter, protect himself from icy winds or snow, and even bring down a passing moose for dinner.

ARMY

Neuropsychiatric Service Appointment.—Col. Charles S. Gersoni, MSC, has been named chief of the clinical psychology section of the neuropsychiatric service at Walter Reed Army Hospital. For the past four years, Colonel Gersoni has been the chief of the clinical psychology branch of the psychiatry and neurology consultants division of the Army Surgeon General's Office. He has been succeeded in the latter position by Lt. Col. Frederick A. Zehrer, MSC.

NAVY

Preventive Medicine.—Lt. (J G) Robert E. Mytinger, MSC, USN, of the preventive medicine division, will represent the Bureau of Medicine and Surgery, Aug. 20 27 at the National Convention of the National Association of Sanitarians, meeting at Miami Beach, Fla. Lieutenant Mytinger will present a paper on "Navy Training in Preventive Medicine."

Conference on Filariasis.—Lt. Leo A. Jachowski, MSC, USN, a parasitologist at the naval medical research unit of the National Naval Medical Center, Bethesda, Md., will represent the Navy at a conference of experts on filariasis and elephantiasis being held at Papeete, Tahiti, Aug. 20 to Sept. 3, 1951. The conference has been called by the South Pacific Commission on Filariasis and Elephantiasis, composed of members from the United Kingdom, France, Netherlands, New Zealand, Australia, and the United States, to discuss postwar research results that have not been published. The commission intends to compile all data for future publication.

Inspection Tour of Naval Medical Facilities.—Rear Adm. Lamont Pugh, Surgeon General of the Navy, returned Aug. 8 to Washington after a personal inspection tour of naval medical facilities in the Pacific Ocean area and the Far East including Korea. The Surgeon General found morale high among Navy medical department personnel and praised the readiness of the Navy medical facilities. Admiral Pugh said "procurement of blood and blood derivatives for use in Armed Forces medical installations still remains one of the outstanding major problems facing the country today." The use of whole blood and blood derivatives in continental Armed Forces hospitals for treatment of personnel of the Armed Forces, not necessarily Korean casualties, has not decreased. There has been a serious drain on existing stockpiles which require immediate replacement.

Rapid Mass Blood Count Method.—A new red blood cell counter that will greatly increase the speed of mass blood counts has been developed by Cornell University under an Office of Naval Research contract. Using the new instrument, which relates the red cell count to the electrical conductivity of whole blood, three technicians can perform 40 to 60 blood counts an hour by "production line" methods, as compared to the present rate of about 12 to 18 an hour. Errors in the visual blood counting methods now used are avoided in the new instrument, since there is no dilution of the blood and the quantity used is not critical.

The counter was developed by Dr. I. S. Wright, Dr. Erwin Sheppard, and Professor W. C. Ballard Jr., of Cornell University, as part of a naval research study of the electrostatic forces in the blood and their relation to coagulation. Mass blood counts are vitally necessary under battle conditions in estimating damage due to hemorrhage, shock, flash burns, and exposure to ionizing radiations. The new method will also be helpful in making routine hospital blood counts and in screening men for military service.

VETERANS ADMINISTRATION

New Hospital Manager.—Dr. Leland E. Stillwell, chief of professional services at the Jefferson Barracks, Mo., Veterans Administration Hospital, has been appointed manager of the 500-bed VA hospital under construction at Iowa City, Iowa. Dr. Stillwell, a veteran of both World Wars, joined the VA Department of Medicine and Surgery in his present capacity in February, 1946.

Neurology and Psychiatry Residents.—Several openings are available in the residency training programs in neurology and in psychiatry at the Veterans Administration Hospital, Coatesville, Pa. The programs were organized by the Philadelphia Deans Committee. Both residencies cover a period of three years or less depending on the previous experience of an applicant, and are designed to prepare residents for certification in neurology or psychiatry by the American Board of Psychiatry and Neurology. The programs include rotation through the Veterans Administration Hospital, Coatesville, Pa., Veterans Administration Mental Hygiene Clinic, Philadelphia, the Philadelphia General Hospital, and university and hospital outpatient clinics associated with Philadelphia's five medical schools. Applications should be sent to Vincent T. Lathbury, M.D., Executive Psychiatrist, Philadelphia Deans Committee, 111 N. 49th St., Philadelphia 39, Pa.

FOREIGN LETTERS

NORWAY

New Chairs of Medicine and Surgery—In Oslo, the teaching of medical students has become increasingly dependent on institutions outside the old Rikshospital, particularly the Oslo City Hosptial, Ullevaal In March, 1951, the title of professor was conferred on the heads of the chief departments at Ullevaal and on the head of the state asylum at Gaustad, Dr Ørnulf Ødegaard. Dr Ødegaard was born in 1901 and qualified as a doctor in 1925, becoming a doctor of medicine in 1933 He has been at the head of the Gaustad asylum since 1938 The promotion of Dr C A Muller of Ullevaal to one of the new chairs of medicine comes comparatively late in life He was born in 1886 and qualified as a doctor in 1910 Since 1928 he has been at the head of Department VIII of Ullevaal Hospital Beloved by patients, students, and nurses, he also has an international reputation based on his work as a clinician and on his cardiovascular studies. The xanthomatosis and allied conditions described by him are known in the Scandinavian countries as Müller s disease

Among the new professors is a younger man, Dr H J Ustvedt who was born in 1903 and who is already well known abroad in connection with his work on tuberculosis and his participation in the International Tuberculosis Campaign Since 1946 he has been at the head of Department IX of Ullevaal Hospital Also on the medical side are the two new professors, Dr R T Hatlehol, born in 1886, and Dr P M Holst born in 1892 On the surgical side there are two new professors, Dr C Rosing Bull, born in 1893, and Dr C B Semb, born in 1895 Prof Semb has been the chairman of the Norwegian Surgical Society since 1939 In May of this year he left Norway for Korea to supervise the Norwegian hospital there Between 1945 and 1947 he was at the head of the Norwegian Army Medical Service His contributions to the surgical treatment of pulmonary tuberculosis are familiar to many outside as well as inside the Scandinavian countries

Sex Habits of Young Men—Dr Tore Berdal, of the Norwegian Army Medical Service, has undertaken a sort of Kinsey survey of the Norwegian soldiers who served in the army of occupation in Germany in 1949 A questionnaire was addressed to 2,750 privates and corporals, of whom 2,717 replied The drafting of these answers was not compulsory, yet only about 1% of the recipients of the questionnaires left them blank About 42% had had sexual intercourse during their six months' sojourn in Germany, and approximately one third of the Norwegian forces in Germany must have had sexual intercourse with women more or less unknown to them In Berdal's opinion this percentage is surprisingly high considering that fraternizing with the Germans was not permitted The frequency of sexual intercourse was considerably lower (35 4%) among soldiers recruited from country districts in Norway than among soldiers from towns (58 4%) A comparison of the sexual intercourse rate among soldiers serving for six months at home and in Germany, respectively, showed little difference, 50 7% for Norway as compared with 43% for Germany

Berdal's Table 7 deals with 1,621 soldiers who had not indulged in sexual intercourse throughout their sojourn in Germany and who gave their reasons for not doing so Fear of venereal disease accounted for this in 23 6%, a permanent liaison at home for 19 7%, moral considerations for 9 4%, betrothal for 7%, marriage for 3 8%, religious considerations for 1 8% various combinations of the above considerations for 31%, and other considerations for 3 6%

Berdal's investigations also throw some light on condoms and their efficacy in preventing venereal disease They were employed in 36% of a total of 8,470 sexual contacts made by 1,042 soldiers In 543 cases the reasons that condoms were not employed were analyzed In 59 3% the reason given was lack of a condom, in 14 4% it was considered unnecessary, as the women were supposed to be healthy, and in 7 5% it was dispensed with for ethical reasons, because it seemed unnatural Other reasons that no condom was used were negligence due to alcohol, thoughtlessness, or the like Berdal comments that as most of the women involved were strangers to the soldiers, it is remarkable that so few of them used condoms He also quotes figures to show how effective condoms are in preventing venereal disease

Completion of the International Tuberculosis Campaign—Prof H J Ustvedt, formerly deputy director of the International Tuberculosis Campaign, pointed out on June 30 that this date marked the completion of the International Tuberculosis Campaign It was created in the winter of 1948 by the Danish and Swedish National Red Cross Societies, Norwegian Aid to Europe, and the United Nations International Children's Emergency Fund (UNICEF) This organization could provide dollars, and the Scandinavian organizations could supply expert personnel The International Tuberculosis Campaign began its work in eight European countries to which teams were sent Their activities spread to Asia, to North Africa, and, finally, to Latin America The completion of the program, on June 30, 1951, does not mean that BCG vaccination has ceased on a large scale but that henceforth the World Health Organization has shouldered all the responsibility for this action with the continued economic support of UNICEF While the International Tuberculosis Campaign was largely centralized in the Scandinavian countries, with headquarters in Copenhagen, the activities of the World Health Organization will be regional, with Geneva as the coordinating center

With respect to the activities in the past three and a half years of the International Tuberculosis Campaign, Prof Ustvedt pointed out that, though more than 38 million human beings have been tested with tuberculin and more than 17 million have been vaccinated with BCG, it is at present impossible to say to what extent this action has reduced the incidence of tuberculosis A remarkable reduction in the incidence of tuberculous meningitis among children has been observed in certain European countries, and it may well be that this is the first observable outcome of BCG vaccination Norway s contribution to this work has included 30 doctors and 46 nurses sent abroad with the BCG teams Prof Ustvedt concluded that these health missionaries to foreign countries are an admirable illustration of what small nations can do by peaceful means to promote world unification

Norwegian Medical Film Archive.—Collection and distribution of educational medical films have not heretofore been centralized in Norway Realizing the importance of this matter, Dr Jens Bjorneboe, who edits the medical-scientific work of the organ of the Norwegian Medical Association, *Tidsskrift for Den Norske Laegeforening*, has lately taken an active part in negotiations which have now led to the centralization of these films in an organization known as the Norwegian Medical Film Archive Among its sponsors are the Norwegian Medical Association, the Norwegian Ministry of Health and the Faculty of Medicine The new organization is affiliated with the Norwegian State Film Center, whose large staff of well trained experts can be relied on to give invaluable aid to this new body Hospitals and persons in the possession of medical films are invited to help this new body by loans and gifts Gifts of medical films have already come from abroad, and it is hoped that the Norwegian Medical Film Archive will achieve its aim of acting as a center for lending educational films to all who can make proper use of them The address is Norsk Medisinsk Filmarkiv, Statens Filmsentral, Kronprinsens gate 10 b Oslo, Norway

---

The items in these letters are contributed by regular correspondents in the various foreign countries

SWITZERLAND

Swiss Society for Internal Medicine.—The nineteenth annual meeting of the Swiss Society of Internal Medicine, under the chairmanship of Prof P H Rossier (Zurich), was held in Coire June 1-3, 1951 These annual meetings are the main medical events of Switzerland This year, the charming city of Coire, surrounded by mountains, welcomed over 250 specialists Three principal interests were apparent cardiology, hematology, and internal medicine

The meeting of the cardiologists was attended by physicians from all parts of the country Many foreign physicians had been invited, among them Dr Frau (Milan), who opened the scientific session by showing the remarkable results of research on the dog concerning intraventricular conduction Dr Gilimann (Dusseldorf) presented an interesting study on the cardiac vectors

From the hematologists came interesting reports on tapeworm anemia, the mechanism of which seems to have been made clear by Finnish authors Prof Heilmeyer, the German internist, drew attention to the use of cobalt in some anemias of the Cooley type, which do not respond to iron The communication of Prof Alder (Aarau, Switzerland) lessened the enthusiasm of those who thought of being able to count on effective treatment of leukemia, despite the great number of publications on this subject, transfusions are still the only effective supportive treatment of this disease Even triethylenemelamine does not seem to give the results expected of it

Prof Rossier delivered a paper on relativity of numbers and of statistical methods in medicine Prof Hamburger (Paris) reported on the treatment of nephropathy He discussed the osmotic and acid-base regulation of fluids and described two syndromes caused by hyperosmosis with cellular dehydration Among the new treatments of nephritis, he discussed the intestinal perfusions undertaken in Paris

The following day was devoted to arterial hypertension In his report on medical treatment, Dr J J Mozer (Geneva) warned against certain drugs which, given at the beginning of hospitalization, seem to have a hypotensive action, when mere rest can reduce the blood pressure and cause regression of eyeground changes

Prof Fontaine (Strasbourg, France) discussed the surgical treatment of arterial hypertension He outlined the history of surgery of the sympathetic chain and of the adrenal gland He favors subdiaphragmatic extirpation of the sympathetic system followed by unilateral adrenalectomy Fontaine listed the indications for this operation He pointed out that physicians and surgeons disagreed about the indications for this operation There is no international classification of the different phases of hypertension The value of the operation should not be judged according to the amount of hypertension before and after surgery The patients who have undergone operation may be in perfect health even though their hypertension has been little modified Prof Rothlin (Bâle) emphasized the benefits of hydergin" (ergot alkaloid mixture), which seems to be most effective when there are phenomena of autonomic dysfunction Prof Schoen (Gottingen, Germany) pointed out the value of physical therapy in the treatment of hypertension Prof Brunner and Dr Dimtza opposed radical surgery and expressed the hope that it would soon be supplanted by medical treatment. Prof Vannotti (Lausanne) agreed with Prof. Brunner and Dr Dimtza

ECUADOR

Mass Vaccination with BCG.—Mass vaccination is to be carried out throughout Ecuador Up to now, more than 150,000 vaccinations given to children have resulted in negative reactions to the tuberculin test (Mantoux) The vaccination campaign is directed by Dr Jorge A Higgins of Ecuador Swiss and North American doctors are also participating in the campaign

CORRESPONDENCE

TOTAL POPULATION X RAY SURVEYS

To the Editor—THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION of July 7, 1951, carried an editorial on 'The Value of Total Population X Ray Surveys," which is based on reports of a study made in Gotland, an isolated Swedish island, and reported by Dr L Lonnerblad This editorial, we believe, will be interpreted by many physicians as an indictment of community wide chest x ray surveys as they are being done in this country It is our sincere hope that it was not the intention of the editorial staff to convey this impression

After carefully studying this editorial and the original article published in *Acta Radiologica,* December, 1950, it is our considered impression that Dr Lonnerblad, far from arguing the case against total population x ray surveys alone, is presenting a case which in his experience is against the total tuberculosis control program as we know it in this country

Very little of the text of Dr Lonnerblad s article concerns itself with discussion of x ray surveys, and the part of the article that is concerned with a critique of x-ray surveys is based on a photofluorography examination of the entire population of Gotland in 1943 Dr Lonnerblad states Although the data from the photofluorography mass examination attempted on the entire population of Gotland made in 1943 *has not yet* been fully analyzed, it in a measure *seems* to confirm my hypotheses of 1942, viz., that a total population chest survey does not yield any conclusive results' (italics mine) While the article does state that 99% of the population were examined, no reference is made to other factors that have to do with the tuberculosis death rates, for instance, the type and extent of follow up work, facilities for hospitalization and other forms of treatment, and the economic status of the population as it affects nutrition, housing, working conditions, and recreation Certainly mass x-ray surveys cannot accomplish anything without the presence of these other factors, consequently, it is unfair to assume on this basis alone that x ray surveys have no value

It would seem to be a fair assumption that x ray surveys are not a source of hindrance to the tuberculosis program The only issue, therefore, is whether they are of any help A priori, it must be admitted that one cannot consistently hit a mark unless he knows what he is shooting at, and where he is shooting This is the sole purpose of x ray surveys and would appear to be a self-evident aid to the tuberculosis control program But, passing from the theoretical to practical experience, during the past five years in Florida over 1,700,000 persons have received x ray survey examinations Communities in this state have averaged a chest x-ray examination about once every 18 months instead of once in seven years, apparently as was the case in Gotland, since we do not have information to the contrary The tuberculosis death rate has consistently declined, to an all time low of 17 per 100,000 in Florida during the first five months of 1951 The fact that there appears to be any decline at all is most significant, since the rate has reached such low levels that it is now within the orbit of the law of diminishing returns While no one is so naive as to assume that the x ray surveys alone are responsible for the declining death rates, it would seem equally unsound to allege that x ray surveys have not been an important factor

Dr Lonnerblad points out in his article that the death rate from tuberculosis in Gotland has not decreased appreciably over that in Sweden, but a table in the article by Dr Lonnerblad certainly does not bear out this statement In the year 1942 there were 0 96 deaths per thousand inhabitants in Gotland as against 0 68 deaths per thousand in Sweden as a whole This had decreased to a point in 1947 where there were 0 49 deaths per thousand population in Gotland as against 0 48 deaths per thousand in Sweden as a whole (Incidentally, the editorial in THE JOURNAL quoted this figure incorrectly, since it states the tuberculosis mortality rate for Gotland in 1946 was 0 54 per 100)

Dr. Lonnerblad in his discussion points out the inadequacy of our weapons in treating tuberculosis once the disease has been uncovered. He states "Under existing conditions it would probably be necessary to intervene before the infection has taken place and thus accomplish what is done against other very frequent epidemic and endemic diseases, that is, perform mass inoculation in order to reduce the incidence of tuberculosis and thus avert the problems which naturally result. . . . It is not out of step to center our entire attention on the improvement of resistance of the entire population in a manner similar to that adopted for other very definite infectious diseases, e. g., typhoid fever. . . . With the advent of BCG vaccination we have at our disposal an additional agency of considerable protective value."

This, if I interpret Dr. Lonnerblad's article correctly, is the main thesis presented, and not an argument against x-ray surveys per se.

It is interesting that Dr. Lonnerblad mentions Dr. Arvid Wallgren in his discussion on the value of BCG. This same well-known author from Sweden stated: "On the other hand, one should not exaggerate the efficiency of BCG vaccinations. At best they may protect against the immediate consequence of virulent infection and diminish the incidence of primary and early post-primary tuberculosis. In my opinion there is no prophylactic influence on the development of late manifestations of post-primary tuberculosis." (*Trans. National Association Prevention of Tuberculosis*, London, England, 1949.)

Certainly, in this country, where improved economic conditions, education, and rapidly expanding hospital facilities for isolation and treatment of active tuberculosis are combined with organized case-finding programs to insure the downward trend of the death rate, which is now the lowest on record, one could not advocate the general use of BCG.

After reviewing the editorial at issue and the abstract of the original article in THE JOURNAL, I am of the opinion that the main point of Dr. Lonnerblad's paper has been overlooked. In spite of the title of the article, it should be apparent to the reader that this paper represents a strong argument for the use of BCG in Gotland rather than a criticism of the value of community-wide x-ray surveys.

C. M. SHARP, M.D., Director,
Bureau of Tuberculosis Control,
Jacksonville, Fla.

NERVE BLOCKING AND PAIN

To the Editor:—The June 30 issue of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION contains a group of excellent papers, presenting results in various pain syndromes following block of the stellate ganglion, various nerves or infiltration of painful tissues. Although in some instances the results are remarkable, the authors were unable to explain the reason for the relief in many cases. For example, Adams, in his article "Diagnostic and Therapeutic Block" (page 803), recalled a patient "who had a small painful area in the chest wall, which affected his life considerably. He had it for three years and was most discouraged. He did not appear to be neurotic, but this small area of pain was coloring his whole life. The cause of his pain was not obvious but for diagnosis, I blocked the area involved. He obtained immediate relief and was dismissed when he was pain free for 48 hours. After three months he wrote me that his pain had not returned and that he could put in a comfortable day's work for the first time in three years.

"I do not yet know the origin or basis for this man's pain. The block therapy in his case was more or less a stab in the dark, but it produced results. In a neurotic patient who interprets even pressure as pain, this type of therapy would not have worked."

There is no doubt that definite relief of painful syndromes can be accomplished in many instances by successful nerve blocks, for example, trigeminal neuralgia, intracostal neuralgia, and pain secondary to fractured ribs and pleurisy. The literature is full of reports on excellent results following local and paravertebral block for painful syndromes, and in many of these cases the operator does not know the etiology of the pain. He is not sure of the position of his needles and may not have reached the ganglion or nerve with the injected material. Pender and Pugh (page 798 of the same issue of THE JOURNAL) have realized this difficulty and stress the use of roentgenograms to actually place and check the position of the needles.

I believe that those doing therapeutic nerve blocks for the relief of pain and other conditions would obtain a truer picture of the value of their procedure and also obtain a more accurate evaluation of the effect of "suggestion and the laying on of hands" if they would make it a rule to always precede the attempt at direct blocking by first trying a series of five to 10 intradermal wheels with sterile water placed at random in the skin area overlying the pain. Careful notes should then be made as to the relief of pain, if any, how soon it occurred, and how long it lasted. The results following this test, if unsuccessful or partially so, should then be compared with those following a definite attempt to block the nerve, ganglion, or tissue. I believe that such an approach to therapeutic nerve blocks would not only help to evaluate the patient with a hysterical or functional background but would also give the operator a better conception of what his procedure really accomplishes.

MICHAEL SCOTT, M.D.,
Temple University Hospital,
Broad and Ontario St., Philadelphia 40.

THE SURGEONS' FRONTIER

To the Editor:—Today's medical graduate faces the same problem that has confronted his predecessors. How shall he best develop his capacities and where shall he practice so as to best serve his patients and himself? Years ago young men were urged to go west and grow up with the country. Now the cities of the West are as crowded as those of the East. Where is today's frontier? For the surgeon the county seat town offers a challenge for his specialized services.

Staff appointment to the hospitals in these areas does not require certification by a board, but thorough training in general surgery is needed. These surgeons must be versatile. They must know their way around the abdomen and be competent to handle emergency situations in orthopedics, urology, and gynecology. They must be able to reduce fractures, use the cystoscope and perform cesarian sections. General surgery in the county seat town is all that the name implies. The surgeon is limited only by his ability and integrity in his efforts to save life.

Almost every county seat town in the country offers a place where a good surgeon is badly needed and where he can be successful if he knows how to properly utilize his knowledge. Communities where no other doctor is limiting his practice to general surgery present a golden opportunity. Naturally there will always be a number of general practitioners doing some surgery. The newcomer should not be discouraged if they do not welcome him with open arms. There will always be a few who will refer their surgical cases, and he will be able to win their confidence and through them gain a foothold. His acceptance will be easier if he discards whatever self-conceit he might have. It need not be beneath his dignity to assist an outside surgeon called in to operate, nor to help the family doctor in the postoperative care of this patient, without fee and without malice. He will be exploited at times almost beyond endurance, but humility will be rewarded as the years pass.

The first year will be difficult, for he may treat only a few patients and he may be tempted to fill in his time with general practice. There is nothing to be said against general practice, but no doctor can become a master surgeon and at the same time carry the load of a general practitioner. His time may better be used to survey the over-all medical needs of the community as a basis for future improvement. Any trade center with a population of 20,000 can eventually support a 50 to 100 bed hospital and two doctors specializing in general surgery. Thus he will do the community a real service if he later brings in an associate. This will allow time for study at other medical centers and still keep a surgeon in attendance. Good men attract good men, and gradually the community hospital will become a medical center.

GEORGE A. COLLETT, M.D., Elko, Nev.

MEDICAL MOTION PICTURES

The Steps of Age: Emotions of Everyday Living Series 16 mm. black and white sound showing time 25 min. Produced in 1950 by Film Documents New York for the National Association for Mental Health Inc and the State of South Carolina. Procurable on purchase ($95) from International Film Bureau Inc. 6 North Michigan Ave Chicago 2 or on loan from state or local mental health authorities.

This film is about a woman of 62, at the critical point, when she is crossing into the last quarter of her life It shows her confusion and her first uneasy steps toward insight into herself and her problems Treated very dramatically are the painful emotional problems engendered by her husband's having to retire from his job and the frustrations of unemployment due to old age One of the most poignant scenes of the film deals with interpersonal relations among a grandmother, a mother, and a grandchild, where age differences contrive to turn love into hate

Except for a few sequences, the approach of this film is negative, problems are presented, but few solutions are suggested As such, it can be valuable when used with groups of young people to enable them to recognize and appreciate problems of which they may not be aware and as an introduction to a discussion of the positive means of solving these problems Although a competent discussant should be present whenever this film is shown, the need for a discussant of exceptional ability must be recognized when the film is to be used with older people It is highly recommended for social workers and graduate students of psychology and is also recommended for groups of young people and parent teacher groups if competent discussion leaders are present The photography, direction, and sound are excellent

Gelfoam in Surgery: 16 mm color sound showing time 25 min. Produced in 1949 for The Upjohn Company by Audio Productions Co New York. Procurable on loan from The Upjohn Company Kalamazoo Mich.

This motion picture reveals a few of the elementary points about the clotting mechanisms of the blood as related to the use of hemostatic agents and clearly describes, without any unjust claims, the methods for using gelfoam® (absorbable gelatin sponge) in the control of hemorrhage The process of its preparation is briefly described, and the picture demonstrates how it can be placed over the bleeding point as a small pack or patch to control hemorrhage and may be applied dry or moistened with saline Originally it was thought that thrombin might be necessary, but it soon became obvious that it is needed only in unusual cases, such as hematopoietic diseases Gelfoam® is absorbed by the tissues in about three weeks and produces a remarkably small amount of reaction as it is being absorbed The picture depicts its use on the bleeding surface after cholecystectomy, prostatectomy, hemorrhoidectomy, and removal of brain tumors The film recommends gelfoam® to fill in dead space, this use appears worthy of consideration Its best application seems to be in control of hemorrhage following removal of brain tumors Probably few surgeons will use it to control the bleeding following hemorrhoidectomy Its dramatic use to stop bleeding from a puncture wound of the heart is described, but no claims are made for its use in this type of injury This picture is recommended for a general surgical audience The photography and narration are excellent, and the film is well organized

Problems in the Treatment of Poliomyelitis 16 mm color sound showing time 40 min Prepared in 1950 for The Division of Physical Medicine by Audio Visual Education Service University of Minnesota with the aid of a teaching grant from The National Foundation for Infantile Paralysis. Procurable on loan from The Division of Physical Medicine University of Minnesota Medical School Minneapolis

This film shows, in a large series of patients, the effects of poliomyelitis on the various skeletal muscles of the body The portrayal of actual situations and the presentation of theoretical considerations are not allowed to get between the object and the observer at any time The involvement of individual muscles is well shown In the beginning of the film, there are excellent demonstrations of the spasm of various muscles, in the sense that normal degrees of extension are shown to be painful The extent of weakness and atrophy that can be produced is exhibited in the muscles of the legs, back, and arms, and in the diaphragm and other respiratory musculature An extraordinary view is that of a boy in whom the infrahyoid and suprahyoid musculature becomes active because of the paralysis of the sternocleidomastoid muscles

This motion picture would be of the highest educational value for anyone concerned with the detailed management of poliomyelitis It is perhaps too long and too detailed for the average general practitioner, but it should be invaluable to the orthopedist, the specialist in physical medicine, and the physical therapist who follows through with the specific and detailed reeducation of the patient in whom paralysis follows an acute attack of poliomyelitis The photography is good and the narration fair

Problems of Rheumatoid Arthritis 16 mm color sound, showing time 33 min Produced in 1950 for The Arthritis and Rheumatism Foundation by Medical Film Guild Ltd New York. Procurable on loan or purchase from The Arthritis and Rheumatism Foundation 535 Fifth Ave New York.

This film reviews the incidence of arthritis, its economic and social significance, the lack of facilities for care, and the small sums available for medical research The pathology, the clinical manifestations, and the treatment of rheumatoid arthritis are first presented, showing that arthritis therapy, long before cortisone and corticotrophin (ACTH) came along, had something to offer the patient, though largely nonspecific and preventive There then follows a sequence on hormone therapy

In general it is a good film There seems to have been some confusion from the standpoint of intended audience It is not technical enough for a medical audience and is too technical for lay groups It is not made clear why rheumatoid arthritis is singled out The problem of possible causation is dismissed much too early It is recommended as an introductory film for medical students, nurses, and technicians It might be of some value to lay audiences with some previous knowledge of this This film is not recommended for specialists The photography, animation, and narration are well done

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ABSTRACTS

Medical Practice Acts· Use of Injunction to Restrain Practice of Medicine by Chiropractor.—The State Board of Medical Registration and Examination filed suit to enjoin the defendant from practicing medicine without a license From a judgment in favor of the defendant, the plaintiff appealed to the Supreme Court of Indiana

Section 63—1311 of the Indiana Statutes provides that 'to open an office for such purpose or to announce to the public in any way readiness to practice medicine in any county of the state, or to prescribe for, or to give surgical assistance to, or to heal, cure or relieve, or to attempt to heal, cure or relieve those suffering from injury or deformity, or disease of mind or body, or to advertise, or to announce to the public in any manner a readiness or ability to heal, cure or relieve those who may be suffering from injury or deformity, or disease of mind or body, shall be to engage in the practice of medicine within the meaning of this act It shall also be regarded as practicing medicine within the meaning of this act if any one shall use in connection with his or her name, the words or letters Dr, 'Doctor,' Professor, M.D or Healer, or any other title, word, letter, or designation intending to imply or designate him or her as a practitioner of medicine or surgery in any of its branches" The same section also provides that in charging any person in a complaint for injunction, with a violation of this law by practicing medicine, surgery or obstetrics without a license, it shall be sufficient to charge that he did, upon a certain day and in a certain county, engage in the practice of medicine, he not having any license to do so without averring any further or more particular facts concerning the same

The defendant maintained an office with a reception room and treatment room in which there was an examination table, chairs, and the usual furniture found in the office of a professional man Outside of the premises there was a sign with the lettering R W Henry Chiropractor " The defendant had no license to practice chiropractic. On August 23, 1948, one of the dates charged in the complaint, a witness called at the office of the defendant for treatment, informed the defendant that he was suffering from headache and pains through his shoulder, and asked the defendant whether he could relieve him of these pains The witness removed his shirt, at the defendant's request, and defendant ran his hands up and down his back and across his shoulders, explaining that the bone structure of a person's back and spine was such an intricate mechanism that he would not want to furnish any treatment until such time as x-rays proved there was cause for treatment, or the nature of the treatment needed When he left the defendant's office, the witness took with him a pamphlet extolling the benefits of chiropractic treatment, at the bottom of page one of which was printed the words "R. W Henry, D C," and at the bottom of the last page of which was the following 'R W Henry, D C., Scientific Chiropractic, NCM and X-ray, Phone 4941, 1218 Kossuth Street, Lafayette, Indiana "

The clerk of the county court testified that he had the custody and care of the records relating to the issuance of licenses to practice medicine in any of its forms in the county, and that the defendant did not have either a drugless physician's or regular physician's license

The only evidence produced by the defendant was a deposition of the secretary of the state board of medical registration and examination which stated, among other things, that a chiropractor can receive a license to practice in Indiana if he meets the same requirements as medical men, that there is no examination held exclusively for graduates of chiropractic colleges, whether such college is on the approved list or not, that an applicant would be admitted if he met the same requirements as would be required of a doctor of medicine, that a man, to take the examination, must be a graduate of an approved college, that as far as he knew there are no graduates of chiropractic colleges who have been permitted to take an examination conducted by the medical board since 1927, that the medical board is a composite board organized for the purpose of taking care of all systems of medicine

The plaintiff contended that the undisputed and sole and only evidence introduced, revealed that the defendant was practicing medicine without a license and that the trial court abused its discretion in denying the plaintiff's request for an injunction If the evidence is undisputed and uncontradicted that the defendant was practicing medicine without a license, said the Supreme Court, the trial court has no discretion but, as a matter of law, should grant a temporary injunction Here the evidence showed that the defendant was practicing medicine within the meaning of the term as defined by the Indiana statutes

The defendant contended, however, that since this was a case in equity, the State of Indiana was required to do equity, that the testimony of the secretary of the medical board showed that the board was administering the law in a discriminatory manner, and that therefore the state did not come into court with clean hands and was not entitled to injunctive relief The Supreme Court pointed out, however, that the defendant failed to show that he himself had been injured, prejudiced or harmed by any action of the medical board To avail the defendant, wrongful conduct on the part of the board must be proved to have affected the defendant himself The defendant did not show that he had ever applied for examination or that the plaintiff had applied to him standards different from those fixed by the law and the duly adopted rules and regulations of the board The Supreme Court therefore concluded that the evidence of the defendant was not sufficient to show that the plaintiff was not doing equity and did not come into court with clean hands

Accordingly the Supreme Court found that the evidence was undisputed and uncontradicted that the defendant was practicing medicine without a license and that the trial court had no discretion but, as a matter of law, should have granted the temporary injunction The judgment in favor of the defendant was reversed with instructions to grant the temporary injunction requested —*State ex rel Board of Medical Registration & Examination v Henry, 97 N E (2d) 487 (Indiana 1951)*

Libel Calling Chiropractic Advertising a Misrepresentation.—The plaintiff, Committee for Chiropractic Education Inc., a nonprofit corporation, filed suit against the State Medical Association of Texas and others for damages for publication of an alleged libel From a judgment in favor of the plaintiff, the defendants appealed to the court of appeals of Texas

The plaintiff is a nonprofit organization incorporated under the laws of the State of Texas for the purpose of maintaining a nonprofit educational foundation In February, 1949, this organization caused to be published and circulated in Harris County and other counties in the State of Texas, eight pages of advertisements concerning the chiropractic profession Some time later the State Medical Association of Texas, the Harris County Medical Society and the Travis County Medical Society joined in a statement which was published in a Houston, Texas, newspaper, which stated that the publication by the plaintiff in February "was a paid 'special edition' packed with misrepresentations However, it was written to look like a real news section so that its misrepresentations might appear to be legitimate " The plaintiff alleged that it and the chiropractic profession in general had suffered great injury and damage from the publication and circulation of the defendants' statement and it sought recovery of actual and exemplary damages

The defendant filed a plea of privilege and contended (1) that the plaintiff failed to make out a prima facie case of libel against it since the language charged as defamatory was in no sense libelous per se and (2) that the plaintiff's petition contained no specific charge of defamation, but merely charged that the defendant's statement alleged that the plaintiff's advertisement was "packed with misrepresentations '

In Roget's Thesaurus of English Words & Phrases, the word "misrepresentation" is classified as a "falsehood " The word "falsehood" is therein classified as being a misrepresentation, an untruth, and as perjury, false swearing and fabrication In Black's Law Dictionary, 'misrepresentation" is defined as an untrue statement of fact, an incorrect or false representation which, if accepted, leads the mind to an apprehension of a condition other and different from that which exists Webster s New International Dictionary defines "misrepresentation" as improper or unfaithful representation, and as false or incorrect statements, and as misrepresentations of a person s motives

The courts of this state, said the court of appeal, have recognized that a misrepresentation is a falsehood or untruth with the intent and purpose of deceit Whether the published statement complained of was a defamation and whether the statement was libelous per se are the controlling questions It has been uniformly held that to impugn the veracity of a person is to defame him It is also the established rule in this state that written or printed words which charge dishonesty or fraud, or rascality and general depravity are generally libelous per se Article 5430 of the Texas statutes which defines libel, reads that "a libel is a defamation expressed in printing or writing tending to injure the reputation of one who is alive, and thereby expose him to public hatred, contempt or ridicule, or financial injury, or to impeach the honesty, integrity, or virtue, or reputation of any one " We think it clear, said the Supreme Court of Texas in a prior case, that the enactment of the law, the purpose was not only to make definite what constitutes actionable libel in this state, but to materially modify the doctrine of the common law upon that subject By the terms of the present law, a libelous publication, contrary to the common law rule, becomes actionable without the proof of malice, whether it is or not libelous per se. Under the present law the Supreme Court of Texas has held that it is not necessary to the right to maintain an action for a publication not libelous per se to allege or prove special damages In this case, said the court of appeal, the trial court in effect found that the defendant's language was defamatory and libelous per se Therefore the plaintiff was not required to prove special damages The judgment overruling the defendants' plea of privilege was therefore affirmed —*State Medical Association of Texas v Committee for Chiropractic Education, 236 S W (2d) 632 (Texas 1951)*

Intravenously Administered Albumin in Cirrhosis.—Salt-poor human albumin was given intravenously to 34 patients critically ill with decompensated hepatic cirrhosis The initial dose of 100 cc of 25% solution twice daily was adjusted in each patient, so that a serum albumin level of 4 0 to 5 0 gm was maintained Treatment was continued for many weeks, the minimum effective total dose being about 625 gm Diuresis, with clearing of ascites and edema, occurred in 21 patients This was accompanied by an increase in appetite, weight, and strength and by a feeling of well being In most patients there was a decrease in jaundice Of the 34 patients, 16 were in hepatic coma or semicoma when treatment was begun Nine of these recovered, and eight had diuresis The increased plasma volume and venous pressure associated with albumin therapy did not result in an increased incidence of bleeding from esophageal varices, but the authors warn that the patient's circulatory status must be carefully evaluated before albumin is given They feel that salt poor human albumin is a useful adjunct in the management of severely decompensated cirrhosis when adequate dietary therapy cannot be provided

Benign Essential (Heredofamilial) Tremor—This is a report of 14 cases of essential tremor encountered in a general hospital over 10 yr From this series and from previous reports, the authors summarize the clinical features of this little known but common hereditary disorder The disease, which may begin at any period from infancy to old age, is characterized by a rhythmical tremor involving principally the hands, forearms neck, head, and face The tremor is generally decreased or absent at rest and present on voluntary increase in muscle tonus It is aggravated by emotion, fatigue, cold, caffeine, and nicotine Except for the increased terminal intention tremor, which may interfere with self-feeding and writing accuracy and coordination are little involved There are no defects in reflexes or in sensation The tremor may progress for several years, remain stationary, and then progress rapidly again in old age In most cases the disorder can be traced through several generations, frequently as a dominant characteristic Both males and females are affected, and either sex may transmit the disease The proper treatment of essential tremor is explanation and reassurance that the condition will not be disabling Scopolamine hydrobromide and trihexyphenidyl have no significant therapeutic effect. Phenobarbital gives some symptomatic benefit, as does alcohol The disease can be differentiated from Parkinsonism or progressive lenticular degeneration by the absence of rigidity, the preservation of automatic associated movements and rapid rhythmical alternating movements, the benign course, and the family history It must be distinguished from tremors due to hyperthyroidism, cerebellar disease, dementia paralytica, and emotional tension The underlying pathological lesion is not known

Terramycin in Brucellosis.—Terramycin proved to be highly effective in the treatment of the acute manifestations of brucellosis in 11 patients, nine of whom were bacteremic A 12th patient, with severe spondylitis as a complication of brucellosis, *did not respond The drug was given* in a dose of 100 mg per kilogram of body weight every six hours, or 150 mg per kilogram every three hours, until defervescence, when the dose was reduced to 50 mg per kilogram per day Therapy was continued for 28 days Striking relief of symptoms was noted within a few hours after the start of therapy, but bacteremia persisted for several days in some patients Clinical and bacteriologic relapse occurred in two patients within three months Both were successfully retreated with terramycin All strains of Brucella tested were more sensitive in vitro to terramycin than to aureomycin or chloramphenicol, and therapeutic results were as good with terramycin as with the other two antibiotics Results were far superior to those obtained with streptomycin and sulfadiazine Animal experiments indicate that streptomycin enhances the effectiveness of terramycin against Brucella This combination might reduce the rate of relapse Further experiments demonstrated that smaller doses of terramycin (25 mg per kilogram of body weight) also proved effective in the therapy of acute brucellosis

Ocular Complications in Intracranial Arteriography—The frequency and type of ocular complications occurring after intracranial arteriography was investigated by the authors A total of 80 consecutive patients undergoing this intervention were given an ophthalmologic examination before and after the angiographic examination A table listing the petechial hemorrhages observed shows that 35 patients had cutaneous, 65 conjunctival and 20 retinal petechial hemorrhages More than half the patients had petechiae in two or three of these locations Pupillary dilatation, optic neuritis angiospasm of retinal vessels, and blindness were also observed The cause of these complications is not known, but they undoubtedly result from vascular changes secondary to allergic, toxic, or physical phenomena

Clostridium Botulinum Infection of a Wound —Although a few cases have been reported in which Clostridium botulinum was isolated from traumatic wounds, in none of these were symptoms of botulism present. This paper reports the case of a boy, 13, who died of botulism following contamination with Cl botulinum of a relatively minor gunshot wound of the thigh He had rapidly progressive generalized muscular weakness and great prostration, associated with dysphagia, dysphonia, and inability to cough Death, which occurred nine days after the injury, was due to respiratory failure and bilateral lobular pneumonia It would seem that botulism from this source might occur more frequently, since the organism is ubiquitous in nature, a potential contaminant of every traumatic wound Furthermore, its growth requirements for initiating an infection appear to be almost identical with those of Cl tetani Finally, botulism has been produced in experimental animals by the injection of heated spores, and investigators have demonstrated that the botulinus toxin may be absorbed from broken skin and fresh wounds The observations in this case were consistent with the findings in botulism, except for severe cerebral edema, which has not been previously reported, but which may actually have been a consequence of respiratory failure and cerebral hypoxia

Fatal Gastric Hemorrhage Following Aureomycin —Kleitsch reports the case of a man who was given aureomycin in 250 mg doses every four hours when a recurrent bronchopleural fistula failed to respond to penicillin therapy Aureomycin was discontinued after 20 days of consecutive administration Several days later the patient had a severe gastric hemorrhage which was followed by death Necropsy revealed that it was caused by hemorrhage from a large ulcer 3 cm in diameter in the pyloric antrum immediately adjacent to the duodenum Before aureomycin therapy there had been roentgenographic evidence of a small ulcer in this region It is not possible to state unequivocally that the fatal hemorrhage in this case was due to aureomycin therapy This patient's poor general condition contributed to his rapid death Loss of appetite and a diminished intake of food probably favored extension of his peptic ulcer However, one may be justified in assuming that aureomycin played at least a contributory role Aureomycin in solution has an acid reaction and it seems likely that the continuous administration of such an acid solution to a patient with a peptic ulcer might aggravate the ulceration

Prophylaxis of Acute Rheumatic Fever —Procaine penicillin G in oil containing 2% aluminum monostearate was injected intramuscularly according to one of three dosage schedules in 1,178 patients with exudative tonsillitis or pharyngitis in an attempt to prevent the development of acute rheumatic fever in these patients while 1,162 patients were untreated and served as controls Of the 1,178 patients, 634 were given a total dose of 1,200,000 units of penicillin in three injections over a period of 96 hr, 254 were given 600,000 units in two injections over 72 hr, and 290 were given a single injection of 600,000 units. In 10 patients who had received penicillin and in 42 patients who received no treatment rheumatic fever or possible rheumatic fever developed following the observed illness Data collected on the rheumatic patients in both the treated and untreated groups showed that when the time interval between the onset of exudative tonsillitis or pharyngitis and the onset of rheumatic fever was prolonged, there was bacteriologic or serologic evidence, or evidence from the history, of an intervening untreated streptococcic infection in many instances This is in contrast to the almost complete lack of such evidence of a second infection in cases in which the interval was short If one excludes those cases of rheumatic fever developing after a 45 day interval between the two diseases, there were two cases of rheumatic fever in the treated group and 28 in the control patients These data indicate that penicillin treatment of acute streptococcic infections almost completely prevents the subsequent occurrence of acute rheumatic fever Penicillin treatment was also observed to eradicate the streptococci from the oropharynx of the majority of persons and to inhibit the formation of antistreptolysin The most pronounced inhibition of antibody was that obtained by the dosage schedule of three injections of penicillin over a 96 hr period totaling 1,200,000 units of the antibiotic.

Chloramphenicol in Meningitis —Preliminary tests for in vitro sensitivity of six strains of Neisseria intracellularis to chloramphenicol (chloromycetin®) confirmed the observation made by others that chloramphenicol is significantly active against N intracellularis Animal experiments showed that a high level of protection is afforded by chloramphenicol in mice infected with N intracellularis Fifteen patients, 12 children and three adults, with meningococcic meningitis were treated with chloramphenicol Children received approximately 0 25 gm orally at four hour intervals (1 5 gm daily) and adults 1 gm every eight hours (3 gm daily) after a large initial dose based on 50 mg per kilogram of body weight In five instances chloramphenicol was administered intravenously in the early stages of treatment to achieve a high concentration of antibiotic in the blood and cerebrospinal fluid The total amount of chloramphenicol administered to the 15 patients varied from 5 5 to 30 gm, given over a mean period of 5 6 days In no instance was treatment continued longer than nine and a half days Adequate concentrations were observed in the blood and spinal fluid in patients receiving the drug either intravenously or orally Specimens of spinal fluid initially positive for meningococci in all patients became sterile within 36 hr after the institution of specific therapy During the first 48 hr of therapy an elevation rather than a depression of the spinal fluid white cell count occurred in most of the patients, but meningococci were usually absent as determined by culture Clearing of the spinal fluid occurred with surprising rapidity Temperatures were restored to normal on an average of three and a half days In six instances during the convalescent period, sporadic elevations of temperature were noted but were not indicative of relapse There was remarkable improvement in the appearance of the patients within the first 24 hr of treatment After the third day convalescence proceeded uneventfully One patient with fulminant meningococcemia and meningitis responded very favorably to chloramphenicol The results in these 15 patients indicate that chloramphenicol is an effective weapon against meningococcic meningitis There were no fatalities, nor were there residual signs of meningitis, except in one patient, who showed ophthalmoplegia before antibiotic treatment was instituted This eventually cleared

***Hyaline-Like Pulmonary Membrane in Premature Neonatal* Mortality.**—A pulmonary hyaline membrane is found at autopsy in a significant number of premature babies This hyaline like membrane has been described under such terms as asphyxial membrane, aspiration pneumonia, hyaline membrane, congenital pneumonia, vernix membrane, desquamative anaerosis, eosinophilic membrane, fibrinoid exudate or necrosis, and congenital alveolar dysplasia This study is based on necropsies performed on 439 infants who died neonatally and 264 stillborn infants, making a total of 703, among which were found 114 cases with hyaline like pulmonary membrane (16 4%) The highest incidence occurred in the birth weight category of 1 000 to 1,500 gm Maternal and infant histories, which were available for only 62 of the 114 infants with this membrane, are analyzed, and experiments on animals are described The authors think that the membrane is probably not related to the aspiration of the contents of the amniotic sac Prematurity was the only apparent predisposing factor to formation of the membrane in the lungs of these infants who died in the neonatal period When there is a triad of (*a*) a clinical history of an uncomplicated premature birth, (*b*) progressive respiratory embarrassment with death in one to five days, and (*c*) the presence of the hyaline like membrane as the only significant autopsy finding, the case can be recognized as hyaline-like membrane disease Injury from intrauterine anoxia and extrauterine therapy with high concentration of oxygen (over 60%) may be involved in the formation of the membrane in premature infants Further clinical and laboratory studies are necessary to determine the effects of oxygen concentration, barometric pressure, and humidity on respiration of premature infants

Pregnancy in American Indian Women.—Observations were made on 475 pregnant American Indian women who were delivered at the Navaho Medical Center over the 26 month period ending in August, 1950 These women came to the hospital by choice Nausea and vomiting related to pregnancy occurred in only 14% of these women Only 30 patients gave histories of previous miscarriage A total of 57 cases of threatened, incomplete, and completed abortions were seen during this study There were two women with eclampsia and 23 with severe pre eclampsia There were no maternal deaths, but there were three neonatal deaths Of the systemic diseases complicating pregnancy, syphilis was the most prevalent, with an incidence of 6 9% However, there were only two fetal deaths attributed to untreated maternal syphilis Cesarean section was thought to be indicated in only eight patients High forceps and extraction were never used The average age for the 100 primiparas was 20 5 years There were six women 16 years old or younger, the youngest being 13 There were four primiparas 30 years old or older, the oldest being 32 Of the 475 women, 33 were 40 or older, and 75 had had eight or more pregnancies One group of women had no fear of labor, the other group feared labor and needed analgesia and anesthesia Almost all of the first group were unable to speak English and had had little contact with the white race and its customs Only eight cases of uterine carcinoma were diagnosed among 6,685 hospital admissions during the period of this study possibly because of unusual vaginal cleanliness in these women Congenital anomalies occurred in eight infants

Visual Illusions In Flying—Unusual aircraft accidents led to experiments on visual illusions that affect pilots in operating aircraft at night or under adverse conditions of visibility and weather A survey of aviators indicated that such illusions were relatively frequent Experiments revealed that flying hazards are increased by illusions to which all pilots are susceptible Autokinetic illusions can occur in night flying but can be controlled if the number of formation lights on the planes is increased and if pilots are instructed to shift their gaze Experiments in a Bárány chair, a rotating Link trainer, and the human centrifuge indicated that acceleration and deceleration forces produce illusions of motion and displacement of visual targets and illusions of changes in bodily position Repeated experiments, both in the laboratory and in flight, show that the illusions persist, and that the subjects do not become adapted to the illusory effects A pilot, when flying at night or in a fog, cannot tell whether he is in a climbing turn or in a diving turn Pilots must rely on instruments and must learn to ignore their bodily sensations, no matter how overpowering they may be Much of the fear and mystery involved in spatial disorientation are removed when pilots understand the cause of these illusions and how to counteract them

Pneumonia After Antibacterial Therapy —Since the introduction of sulfonamides and antibiotics into the therapeutic management of pneumonia, death from bacterial infections of the respiratory tract now rarely occurs in adults, and in children fatalities have been greatly reduced With penicillin therapy, the temperature usually fell to normal within 24 hr and improvement in the clinical condition was noted Hospitalization ranged from two to five days Fatal cases were limited generally to infants 2 or 3 weeks old or to children with some additional disease In the past 10 yr Menten and McCloskey examined lungs from approximately 250 children who died from pneumonia and from about 450 other children who died from different causes but who also had complicating terminal pneumonia Lungs of children dying with pneumonia after receiving adequate antibiotic treatment contained few or no bacteria These abacterial lungs showed extensive cellular hyperplasia of the alveolar walls and few or no neutrophilic leukocytes The bronchi and bronchioles were free from involvement and appeared normal Whether the tissue changes were caused by residual toxins of bacteria removed from the field by sulfonamides and antibiotics or were due to an unidentified virus remains unanswered

Chloramphenicol in Syphilis.—This study concerns a clinical and serologic evaluation of syphilitic patients treated with varying dosages of chloramphenicol The daily dose was divided into six portions and administered orally every four hours The dosages were established on the basis of weight groups rather than the exact weight of each patient Seventy nine patients with primary and secondary syphilis were treated with 30 and 60 mg per kilogram of body weight daily for four to eight days The initial results in clinical healing of primary and secondary lesions were as favorable as with penicillin treatment The highest percentage of seronegativity was achieved by patients treated with 60 mg per kilogram daily for eight days Dryness of the mouth and mild diarrhea occurred only occasionally Several patients had mild Jarisch-Herxheimer reactions manifested by 1 to 2 degrees (F) elevation of temperature Red granular glossitis and pharyngitis developed in five patients, but the tongue and pharynx rapidly returned to normal following the administration of vitamin B complex The serologic progress of all except one of the 11 patients with early latent syphilis was favorable but within the short period of the follow-up, none attained seronegativity Ulcerative lesions healed in all three patients with late syphilis who were treated with 60 mg per kilogram daily for 15 days The cerebrospinal fluid cell counts of a patient with paresis and of two with acute meningovascular syphilis returned to normal after 15 days treatment No improvement was noted in a patient with optic atrophy and a patient with tabes dorsalis As regards the possible masking effect on a syphilitic infection when small doses of chloramphenicol are used to treat gonorrhea, the authors believe that the same post-treatment observation for the possible development of concomitantly acquired syphilis should be observed as has been advised following penicillin treatment, i e, from four to six months Chloramphenicol appears to be an effective oral antisyphilitic agent In the treatment of neurosyphilis this antibiotic should be given for at least 15 days

One Injection Schedule for Early Syphilis.—Procaine penicillin G, by providing adequate, sustained penicillin blood levels, led to the investigation of the single dose schedule in the treatment of syphilis Seventy-one patients with dark-field positive syphilis were treated In 36 patients a diagnosis of secondary syphilis was made, 21 patients were seropositive primary, and 14 were seronegative primary To each of the 71 patients 2,400,000 units of crystalline procaine penicillin G in peanut oil with 2% aluminum monostearate was given intramuscularly in injections of 600,000 units at each of four sites simultaneously At the end of a follow up period of six or seven months, 70% of the patients were clinically and serologically negative No serious reactions were observed Effective blood levels were maintained for all the patients for 96 hr following the one injection schedule Preliminary results of this study indicate that a one injection schedule is effective in the treatment of early syphilis however longer periods of observation are necessary for final evaluation

External Endometriosis.—Te Linde and Scott limit their discussion to external endometriosis, pointing out that internal endometriosis or adenomyosis is a separate clinical entity External endometriosis is increasing, and it occurs oftenest in women in the childbearing age The authors review their observations on 243 women in whom they performed operations primarily for endometriosis Pain in the lower abdomen and especially dysmenorrhea are the most characteristic symptoms There is, however, no typical history of endometriosis, and the authors feel that laparotomy on the basis of the history alone is not justifiable If surgical treatment is used in young women it should be conservative, so that the woman will still be able to bear children The evidence concerning the value of hormones is still inadequate The authors use hormones only for patients who refuse surgical treatment Because testosterone has been known to cause hirsutism, they prefer diethylstilbestrol, but this hormone has been known to produce severe uterine hemorrhage Various theories have been advanced with regard to the etiology of endometriosis The authors feel that their experiments on the creation of endometriosis in the monkey indicate that cast-off menstrual endometrium is capable of growth This fact greatly strengthens Sampson s theory of retrograde menstruation

Treatment of Angina Pectoris with Propylthiouracil —Thyroidectomy has been largely abandoned as a treatment for angina pectoris, but the antithyroid drugs have been employed by some investigators This paper reports on seven patients treated with propylthiouracil who had had angina pectoris for over a year but no recent attacks of myocardial infarction or congestive failure Coronary arteriosclerosis was the only apparent cause of angina pectoris Relief of pain was significant in three of the seven patients, transient in one, slight in one, and absent in two When benefit occurred, it usually appeared about two months after the beginning of treatment with propylthiouracil Mild to moderate myxedema was produced in all cases No toxic reactions were encountered, even with large doses (800 to 3 000 mg daily) for many months Improvement may be related to a decline of the circulating thyroid hormone rather than to general metabolic depression The results seem sufficiently favorable for this therapy to be considered in cases in which the usual medical measures fail to restore a reasonable degree of painless activity Before the therapy is abandoned as ineffective, dosage should be adjusted and treatment continued until myxedema becomes evident

Treatment of Pneumonia with Bacitracin.—Bacitracin is an antibiotic produced by the Tracy I strain of Bacillus subtilis Its bactericidal spectrum is comparable to that of penicillin in local as well as systemic application, and it is sometimes effective when other treatments fail Reisner and associates tried bacitracin in lobar pneumonia because pneumococci are highly sensitive to bacitracin, and because pneumonia runs a sufficiently consistent course to permit the evaluation of a new therapy Bacitracin in doses of 15,000 units every six hours intramuscularly cured early cases of pneumonia without bacteremia, but such doses were inadequate to clear the blood of infection Of eight patients treated with the small doses, five recovered and three had to be changed to penicillin therapy to effect cure In a later study 14 patients with lobar pneumonia were treated with bacitracin in doses of 30,000 to 99,000 units intramuscularly every six hours Twelve of these 14 patients recovered, one had to be changed to penicillin therapy, and one died of bacterial endocarditis, although his pneumonia responded well to treatment The authors feel that bacitracin is an effective agent in the treatment of pneumococcic pneumonia All patients had moderate albuminuria, casts, and impairment of concentrative power of the kidney and of phenolsulfonphthalein excretion, lasting for a variable time after therapy This nephrotoxicity of bacitracin necessitates caution but does not contraindicate its use in suitable cases

Lipedema of Legs —Wold and associates present observations on 119 cases of lipedema, which were examined at the Mayo Clinic from 1937 through 1946 The term lipedema was coined by two of the authors to describe large legs due to the subcutaneous deposition of fat in the buttocks and lower extremities and the accumulation of fluid in the legs Characteristically, there is symmetrical bilateral enlargement of the buttocks and lower extremities, which begins almost imperceptibly and progresses gradually Progressive enlargement of the limbs is ordinarily associated with gain of weight, but evidence of obesity of the trunk upper extremities, face, and neck may be entirely absent The enlargement of the limbs is accentuated by orthostatic activity, particularly in warm weather, and, although rest in bed may cause some decrease in size of the limbs, owing to removal of fluid, even prolonged bed rest will not reduce the limbs to normal size The authors stress that this condition differs from lymphedema in that women are almost exclusively affected that both limbs are symmetrically involved, that the swelling is usually soft and that pitting is minimal, that there is usually a family history of large legs, and that episodes of inflammation, such as are commonly observed in lymphedema, are usually absent Each of the 119 patients observed at the Mayo Clinic was examined by one of the consultants in the section on peripheral vascular disease, since the disease is often confused with chronic venous insufficiency and lymphedema All but one of the patients were women Most of the patients were overweight, a preponderance of the excess fat being in the lower half of the body In most instances this represented an exaggeration of the normal female configuration Discomfort in the legs, consisting of diffuse pain tenderness and aching distress, was a prominent symptom in about one half of the group Chronic induration cellulitis and stasis lesions did not occur unless there was an associated, coincidental chronic venous insufficiency The basal metabolic rate was usually less than 0%, but none of the group had clinical evidence of myxedema. Anxiety concerning the appearance of the lower extremities and possible serious significance of the edema was usual

Electrocardiographic Changes During Emotion.—A group of 35 patients, including 18 men and 17 women about half of whom were over 45 years of age, were subjected to electrocardiographic tests The majority had complaints referable to the cardiovascular system, some originating in structural heart disease others in purely functional disturbances Electrocardiographic electrodes were attached to the patient, who lay on a bed while he was interviewed The physician who was familiar with the patient s history, directed the conversation from time to time to topics known to be disturbing to the patient and which were relevant to his illness At other times the patient was asked to relax or was diverted by pleasant conversation Electrocardiograms were taken at frequent intervals during the interview Notes were made of the patient's behavior, movements, voice, and remarks, as an aid to the assessment of his emotional state In order to compare the electrocardiographic changes coincident to the stress of life situations with those resulting from another type of stress the electrocardiograms after exercise were studied in 19 of the patients In five of these 19, the rate after exercise did not reach that during anxiety in the interview In one of these the heart rate during emotional disturbance was 112 and immediately after exercise (the equivalent of walking briskly up four flights of stairs) did not exceed 95 In 14 patients the rate immediately after exercise was comparable to that attained during the emotional disturbance, so that the electrocardiographic complexes could be compared at similar heart rates In eight of these the electrocardiogram was identical following exercise and during the disturbed emotional state In four others the changes were in a similar direction but less in degree after exercise than during anxiety or resentment In the remaining two the changes after exercise and during anxiety were in a different direction

Streptomycin in Leprosy—Observations on 114 patients with leprosy revealed that in doses as low as 0 5 gm daily, streptomycin and dihydrostreptomycin favorably influence the specific cutaneous and mucous membrane lesions The symptoms associated with acute or recurrent iridocylitis can often be controlled with these antibiotics, but they exert little, if any, beneficial effect on such complications as acute lymphadenitis, orchitis neuritis, or the associated edema of the mucous membranes or skin The appearance of toxic manifestations, vertigo, tinnitus, and loss of hearing usually precludes the continuous administration of streptomycin or dihydrostreptomycin beyond a period of six months, and rarely will a patient tolerate them for more than a year Although there is much clinical improvement at the end of such periods of treatment, the concentration of bacilli in the remaining skin lesions remains unaltered However, reduction in size of lepromas must represent a reduction in the absolute number of bacilli in the tissue The results obtained with these antibiotics resemble those obtained with the sulfones, but these can be administered indefinitely, and with them a reduction of bacilli in nodular lepromatous lesions can be demonstrated after two or three years of treatment The early response of mucous membrane lesions to the antibiotics is undoubtedly due to the elimination of secondary invaders, growing in and upon leprous lesions of the nasal, pharyngeal, and laryngeal mucous membranes However, the healing of the leprous ulcerations indicates that the antibiotics also influence these lesions themselves Unless less toxic products are found, or unless the dosage can be further reduced without impairing the therapeutic activity, streptomycin and dihydrostreptomycin can be used only as adjuvants to sulfone therapy They can be used (1) in combination with the sulfones to hasten resolution of specific leprous skin and mucous membrane lesions at the beginning of treatment, (2) to effect further clearing of residual leprous skin lesions that have reached a stationary stage with sulfone treatment, (3) to relieve annoying symptoms of sulfone resistant mucous membrane lesions and to heal such lesions, (4) to abort attacks of acute leprous iridocylitis, and (5) for treatment of patients who have an idiosyncrasy to the sulfones

Lepromatous Eruption During Diethylstilbestrol Therapy.—In a man, 84, a widespread lepromatous eruption on the limbs and erythema of the chest developed in the course of a few days There were no other signs of leprosy, and he had no constitutional symptoms Thirteen months before the skin eruption appeared, prostatic carcinoma had been diagnosed clinically, oral treatment with diethylstilbestrol (α,α'-diethyl-4,4 -stilbene diol) was started at that time and was continued until the skin lesions appeared Even when the prostate was first examined rectally, it was felt that the findings on palpation were not so characteristic of carcinoma as to exclude a purely inflammatory condition As there were no grounds for surgical intervention, and as, in view of the patient's age, biopsy was not considered essential, no histological examination was made In the light of the leprous nature of the skin lesions, it may be that the patient actually had lepromatous prostatitis and osteitis Whether there was any relation between the prolonged and heavy dosage with a powerful synthetic estrogen and the sudden clinical manifestation of a hitherto unsuspected infection by Mycobacterium leprae may interest leprologists, since hormone preparations are used in patients with leprosy for intercurrent conditions It also raises the question whether hormones might be useful adjuvants to other therapy in leprosy It is possible that the predominantly male sex incidence of leprosy during the reproductive years of life is in part determined by hormones The puerperal exacerbations of leprosy suggests that conditions prevail at this time that favor an acceleration of the infection, and these conditions may be related to the change in endocrine balance then obtaining The literature reveals a case of a woman in whom leprosy appeared during treatment with thyroid

ACTH and Cortisone in Allergic Manifestations —Fifteen patients with severe and intractable asthma of four months to 54 years' duration were treated with corticotrophin (ACTH) and/or cortisone Corticotrophin was administered four times daily, usually in 20 mg doses, for four to 29 days For most patients the total dose for the course was about 400 to 500 mg, although in three it was over 1,000 mg If the response was satisfactory, the doses were gradually reduced, beginning about the fourth to the fifth day If the response was considered unsatisfactory, cortisone was added, while administration of corticotrophin was continued or reduced Several patients were given cortisone from the start The daily dose in such cases was 200 mg in two injections per day for the first two or three days, reduced subsequently to 100 mg Six patients obtained complete relief, all of them with corticotrophin Incomplete yet satisfactory relief was obtained in four, two of these with corticotrophin, one with cortisone, and one with corticotrophin followed by cortisone Associated nasal symptoms also improved, but less rapidly and less pronouncedly than the asthma In five patients results were slight or questionable After treatment was stopped, relapses occurred in most of the patients Seven additional patients were treated with corticotrophin or cortisone for syndromes other than asthma, one had generalized and weeping atopic dermatitis, two had severe generalized reactions to penicillin administration, one had generalized eczematoid dermatitis, and three had hay fever Satisfactory results were obtained in the patients with dermatitis and penicillin reactions, while moderate symptoms were not definitely removed in the patients with hay fever Corticotrophin and cortisone are of appreciable value in the temporary treatment of certain types and phases of allergic syndromes They are most helpful in intractable asthma, in acute status asthmaticus, and in severe drug reactions Limitations in the usefulness of these hormones are as follows 1 The length of remissions after a single course of treatment varies from a few days to a few months 2 The necessity for frequent injections is a handicap 3 Some types of allergy do not respond Corticotrophin and cortisone are not substitutes for more basic allergic management The dangers and hazards from continuous and sometimes from temporary use of these drugs are numerous, and the hormones must not be employed without a full understanding of their many actions In patients treated with corticotrophin or cortisone the skin reactions to antigens and histamine remained unchanged Quantitative studies of the ophthalmic and nasal reactions in those who had nasal and conjunctival allergy showed them not to be significantly altered Sensitizing antibodies remained unaffected after treatment with corticotrophin or cortisone It is possible that the simple titration tests do not simulate the conditions of chronic allergy and that tests devised to resemble more closely continuous allergic stimulation might show a more decisive influence of these hormones on allergic reactivity

Corticotrophin and Cortisone in Allergic Diseases —Thirty-one patients with persistent severe asthma that was of bacteria or combined bacterial inhalant origin were treated with cortisone or corticotrophin In adults the daily dosage was rarely over 100 mg for cortisone or 80 mg for corticotrophin in divided doses at six hour intervals With children and infants the doses were one half or less of the adult dose Occasionally, a patient was comfortably free of dyspnea by the third day, but in severe cases recovery took from 10 to 14 days In almost all cases relief of dyspnea eventually was substantial, but asthma returned within a few days or weeks after cessation of treatment Eleven additional patients, six adults and five infants with allergic dermatitis, were treated with corticotrophin and cortisone The dosage and the results were the same as in the patients with asthma Five patients with chronic urticaria of many months' duration obtained relief in three to five days with corticotrophin or cortisone, but there was little lasting effect unless a cause was discovered and removed The value of a temporary respite must not be minimized, and the benefits of prolonged treatment with corticotrophin and cortisone have not yet been adequately explored Chemical and electrophoretic studies were made on the serums of 19 adult patients with chronic infective asthma, five adult patients with chronic intrinsic dermatitis, and four children with intrinsic dermatitis (infantile eczema) The patterns in many serums showed distinctly abnormal distribution of the various protein fractions, albumin, and alpha$_1$, alpha$_2$, beta, and gamma globulins Comparative studies suggested that these changes are not the result of the allergic state per se, but are related directly or indirectly to the chronic underlying infection, since similar alterations of protein distribution have been observed in such chronic nonallergic infections as osteomyelitis and bronchiectasis These changes were even comparable to the profound changes recorded by Reiner in lupus erythematosus Immunologic studies indicated that the symptomatic benefits and tissue alterations resulting from treatment with corticotrophin and cortisone are not due to interference with the immediate wheal type reaction of antigen antibody sensitized cells It was further observed that the skin sensitizing antibody of allergic serums is not wholly contained in the gamma globulin fraction of such serums

Acute Myocardial Infarction.—The authors discuss data obtained from clinical records and gross or microscopic postmortem observations in 100 cases of acute myocardial infarction that occurred in 60 men and 40 women between 1940 and 1949 Without the aid of the electrocardiogram, the clinical diagnosis of myocardial infarction was made correctly in 69 cases Electrocardiograms were taken in 85 cases Microscopic dating at autopsy indicated that the infarction occurred prior to the taking of the electrocardiogram in 75 cases An electrocardiographic diagnosis of recent infarction was made in only 52 (69%) of these Reevaluation of the electrocardiogram in an additional six instances (8%) revealed patterns strongly suggestive of acute infarcts, in two instances a "residual" coronary pattern was present In only 11 cases no changes suggestive of myocardial infarction were noted In 72 of the 85 cases the three standard limb leads with one precordial lead (CF_4) were employed initially In 62 of these infarction had occurred prior to the last electrocardiogram Although there was electrocardiographic evidence of acute infarction in only 45 (72%) of these, an additional nine cases (14%) showed abnormal changes compatible with possible infarction Thus in 86% of cases in which only these four leads were used the presence of acute infarction was either indicated or suggested The anterior wall of the left ventricle was involved in 68 instances, the lateral wall in 23, the posterior portion of the left ventricle in 30, the posterior right ventricle in one, the anterior portion of the interventricular septum in 22, and the posterior septum in six There were eight cases of rupture of the ventricle A close correlation was observed between the clinical and microscopic estimates of the age of an infarct, when Mallory's criteria were used The commonest associated major pathological conditions were pronounced generalized arteriosclerosis in 50 cases, chronic cholecystitis with cholelithiasis in 13 cases, and pulmonary infarcts in nine cases

Reaction of Adrenal Cortex to Stress.—Adrenal cortex response to standardized physical exertion and added emotional stress, as measured by changes in circulating eosinophil levels, was studied in healthy, well trained oarsmen Members of the Harvard varsity and combination crews were observed during a two-week training period and immediately before and after con tests with Yale crews In the varsity crew, within four hours of the first time trial, the original average eosinophil level of 123 was reduced to 19 and after the second time trial to 38 Immediately before the actual race the average count was only 64 and fell to 3 within four hours thereafter In certain oarsmen the lowest level of circulating eosinophils was reached after one hour, whereas in most it was reached only after four hours It should be emphasized that the varsity four-mile race was extremely hard and tense, won by only a quarter of a length, with a spectacular and frightening finish In the combination crew, after the time trial the average initial count of 108 fell to a final 56 On the day of the actual race the initial count was low, averaging 42 and there was no fall at either one or four hours, there was a slight mean rise to 59 eosinophils per cubic millimeter The race differed greatly from the varsity race, since it was won by six lengths, with Harvard leading easily all through and with no doubt of the outcome It was concluded that, in well trained persons, emotional stress, either alone or in combination with muscular activity, may lead to a highly effective adrenal stimulation and may represent a necessary link in the mechanism of adaptation Practical application of eosinophil counts made under conditions of standardized stress may well facilitate the identification of persons with unsatisfactory adrenal response to stress The simplicity of the procedure would permit its use as a screening device In men with active allergy and in two persons whose spleens had previously been removed no deviation from normal response was detected

Flocculation Test in Diagnosis of Trichinosis—Bozicevich and co-workers mention shortcomings of earlier complement fixation and flocculation tests in the diagnosis of trichinosis and describe a new flocculation test, which, they hope, will overcome many difficulties There are descriptions of the preparation of the trichina extract, the stock bentonite, the stock antigen, and the slides and antigen pipets as well as of the test itself The complement fixation test was used as the standard for the evaluation of the flocculation test The data so far available do not indicate a superiority of the flocculation test over the complement fixa tion test, but if they are equally sensitive and specific, the out standing advantages of the former should make it the test of choice With the flocculation test, results can be obtained in minutes, and its performance does not require highly trained personnel It seems likely that the antigen can be prepared com mercially, and, if so, it will be possible for almost any laboratory to perform the test

Malignant Exophthalmos· Relation to Thyrotoxicosis and Pituitary Hormone —The series of 12 cases of malignant exophthalmos presented here illustrate the wide variations that may occur in the course of this condition and in its response to orbital decompression, thyroid therapy, and other treatments The authors question whether malignant exophthalmos is a single entity and discuss its therapy and its relation to pituitary thyrotropic hormone and thyroxin metabolism They feel that malignant exophthalmos is a self limiting condition, and, although it is connected with the secretion of pituitary thyrotropin and of thyroxin, the relation is indirect and still unknown Thyroid administration is probably ineffective The effect of any therapy must not be confused with the spontaneous improvement that occurs in the later stages of the condition In one type of case the ophthalmic signs become aggravated after thyroidectomy Therefore, in patients with toxic goiter presenting ocular protrusion as opposed to mere lid retraction, it is wise to avoid thyroidectomy If the thyrotoxicosis is severe, it is probably safer to treat it by bed rest or by one of the slow nonsurgical methods In cases of mild or moderate exophthalmos, where the eyeball is not in danger from exposure, radical treatment should be withheld in the hope that a spontaneous remission may occur Surgical treatment is indicated if exophthalmos becomes pronounced Lateral tarsorrhaphy may be useful, but in the severest cases, as when chemosis of the conjunctiva and corneal ulceration are present, orbital decompression should be considered

Methonium Salts in Hypertension —Although the curarizing effects of the methonium series first attracted attention, it was soon found that the pentamethonium and hexamethonium halides, shown to be ganglion blocking agents, produced reductions in blood pressure in normal and in hypertensive persons Smirk and Alstad investigated the response to these methonium halides in 150 cases of hypertension of varied etiology Fifty-three patients have been under treatment for periods of two to 14 months It was found that there is a close similarity in the hypotensive effects of pentamethonium and hexamethonium bromides, though tests show that hexamethonium bromide is usually slightly stronger in action These investigators could interchange these substances at approximately the same level of subcutaneous dosage Drops in blood pressure following methonium injections are influenced by posture, being greater as the patient approaches the vertical Under comparable conditions patients with higher pressures tend to have greater lowering of blood pressure after hexamethonium bromide injections. Apart from some of the patients with impaired renal function, almost all hypertensives can be controlled by these drugs Among those with impaired renal function the four selected for treatment were readily brought under control without deterioration in their renal excretory capacity Repeated administration gives rise to considerable tolerance, so that 5 or 10 times the original dose may be required to produce the same effect Development of tolerance to hexamethonium bromide gives an equivalent degree of tolerance to pentamethonium bromide, and vice versa The hypotensive actions of pentamethonium and hexamethonium salts are enhanced with a salt poor diet (0 2 gm of sodium in 24 hr) to such a degree that dangerous reactions may occur if the effects of this potentiation are not allowed for in determining dosage Hypertensive headaches can be relieved in most patients There was great improvement of dyspnea, and papilledema and retinal exudates subsided Pulmonary congestion disappeared, and there are indications of reduction in heart size and electrocardiographic improvement

Angiocardiography in Congenital Heart Disease —Some investigators assert that angiocardiography is simple and harmless, but the results in 172 cases at Guy s Hospital contradict this statement In 115 of these cases, angiocardiography was performed with the patient under general anesthesia and in the remaining 57 with local analgesia and adequate premedication The ages of these patients ranged from 3 to 37 years Most patients under 12 required general anesthesia Three patients died during the procedure—two while under general anesthesia and one who received local analgesia only A fourth patient died on return to the ward In another patient, aged 3, signs of cerebral anoxia developed, but finally the child recovered A history of cyanotic attacks or of attacks of unconsciousness is of grave prognostic significance All four children who died had had such attacks as did the child of 3 who had cerebral anoxia Since even the slightest degree of anoxia involves grave dangers, every effort should be made to prevent oxygen lack Atropine should be given (1/100 grain [0 60 mg]) half an hour preoperatively to any patient over the age of 1 year, so that there are no secretions from the tracheobronchial tree Angiocardiography should be done in an x ray theater with full surgical and anesthetic equipment to deal with any emergency The patients should be kept in the x ray department for at least 15 min after the operation Collapse occurred within this period in all four of the fatal cases For the premedication of older patients pentobarbital and atropine are recommended, and for the younger ones rectally administered thiopental and atropine Quinidine and a test dose of iodopyracet solution (diodone") should also be given preoperatively Cyclopropane, ether, and oxygen, given through a cuffed endotracheal tube, form the anesthetic of choice Procaine should be administered intravenously through a large cannula inserted into the vein under direct vision both before and after the injection of diodone Blood pressures and electrocardiographic tracings ought to be recorded

Oculoglandular Tularemia Transmitted from Contaminated Sewer Water W R. N Lindsay and J W Scott.—p 146

Nutrition for Older Persons.—The health of older persons is becoming of increasing concern as the percentage of these persons increases in the population Protein is one type of food constituent that older persons frequently neglect, and meat, cheese, and milk are unlikely to be eaten in adequate amounts This neglect is due to a mistaken notion that meat is harmful for older persons Little or no cheese is eaten, because of the old wives tale that cheese is indigestible and constipating Little milk is taken, because these persons grew up in an age when the value of milk was not appreciated Most persons know that protein is needed for growth, but it is generally not realized that there is a constant destruction and loss of body protein that must be replaced from the food supply at any age The needs of older persons for calcium and iron should have particular attention If calcium intake is insufficient to maintain a fairly constant amount of calcium in the blood, calcium can be withdrawn from the bones, with consequent weakening of the bone structure It is likely that the increased fragility of the bones of many older persons is the result of a long standing inadequate supply of calcium in the diet Most vitamins are needed as much in age as in youth The author gives a list of food essentials for older persons and stresses that long standing food prejudices and long standing faulty food habits form one of the main causes of a poor state of nutrition in older persons

*Endoscopic Transpleural Sympathectomy According to Kux in Treatment of Duodenal Ulcer C Job and R Villinger —p 734
*Therapeutic Use of Procaine Hydrochloride Clinical Experiences R Mancke W Masuch and G Orzechowski —p 737

Vascular Component of Epilepsy —Forster demonstrates that in regard to symptoms there is a parallelism between epilepsy and brain lesions with a vascular component such as in strangulation, carbon monoxide poisoning, and disorders of the vessels of the brain Impairment of the blood perfusion of the brain is an essential factor in all these conditions The parallelism in the motor symptoms during the recovery phase of strangulation, carbon monoxide poisoning, and convulsive attacks, to which may be added temporary pyramidal symptoms, suggests that vascular factors are chiefly responsible Penfield has pointed out that vaso constriction may persist in the brain for a time after the epileptic attack has subsided

Endoscopic Transpleural Sympathectomy for Duodenal Ulcer —The endoscopic transpleural sympathectomy that Kux recommended for the treatment of duodenal ulcer in 1948 has been used at the clinic of the University of Imsbruck for three years Kux himself has performed it in about 350 cases without a fatality A thoracoscope is introduced into the pleural cavity through an intercostal space The opening made into the thoracic wall is hardly more than 1 cm long A preliminary pneumothorax collapses the lung so that the portion of the sympathetic that passes through the costovertebral sinus becomes visible After the sympathetic and splanchnic have been divided with the cauter the pneumothorax is suctioned off The method requires only about 15 min can be carried out with the patient under local anesthetic, and causes no disfiguring scars Furthermore, it involves almost no risk for the patient, most of the patients can be discharged from the hospital three days after the intervention and can resume their occupations in a short time This treatment is restricted to duodenal ulcers because with gastric ulcers the possibility of malignancy must always be kept in mind, particularly if the patient is over 40 In a follow up of 110 of the patients in whom Kux had performed a transpleural sympathectomy, results were found to be the same regardless of whether the operation had been done only on the right side or on both sides, provided it had been radical A few patients who had had the operation on the right side later required sympathectomy also on the left side because of recurrence of symptoms but the expected improvement was still not realized In all of these patients the peptic ulcer had begun before the age of 20 Nearly all the other patients who had undergone radical resection on the left side, when a nonradical operation on the right side had been followed by recurrence, remained free from symptoms after the second intervention Radical sympathectomy on the right side is necessary for the success of the intervention, but bilateral radical operation is unnecessary Radical operation on the left side should be done only if for technical reasons the operation could not be radical on the right side Patients in whom the ulcer developed before the age of 20 have a much less favorable prognosis than those in whom the ulcer develops later in life

Procaine Hydrochloride Treatment —The authors compared the therapeutic effect of a combination of procaine hydrochloride and solution of honey with that of procaine hydrochloride alone in allergic disorders (bronchial asthma colic, and diarrhea) Five patients were studied It was found that the preparation containing the honey was tolerated better than the plain solution of procaine hydrochloride The latter must be given very slowly, if the injection is made intravenously, whereas the honey compound can be injected more rapidly Apparently the honey compound is not quite so effective as procaine hydrochloride alone but the difference is apparently only quantitative and can be compensated for by larger doses The honey and procaine hydrochloride proved effective in all types of spastic conditions Its undesirable secondary effects were generally mild

Esophagectomy.—After briefly reviewing the symptoms of carcinoma of the esophagus Morrin discusses the technical difficulties encountered in the surgical treatment He evaluates different surgical techniques and says that he prefers the operation suggested by Taylor, because it is applicable to a majority of cases, it can be done in stages, it has fewer difficulties of ap proach and it obviates the fatal risk from leakage of an intrathoracic anastomosis He describes a case in which he performed this three stage operation with satisfactory results In the first stage he resected the thoracic esophagus and created a cervical esophagostomy and epigastric cardioesophageal stoma In the second stage the stomach was mobilized brought out through the abdominal wall, and passed upward through a subcutaneous tunnel in front of the sternum to meet the esophagostomy In the third stage the cervical esophageal stump was anastomosed to the stomach and continuity of the alimentary tract was reestablished Three months later the patient was eating without difficulty and living a normal life

Streptomycin in Tuberculosis of Middle Ear —The first case reported in this paper was that of a boy 6 who while in bed for 10 months for a tuberculous pulmonary lesion had a rupture of the right tympanum followed by four weeks of profuse discharge Streptomycin therapy (1 gm daily in divided doses) was started 10 days after his admission to the hospital and was continued for three months The aural discharge lessened after two or three weeks of treatment, and it was found that the tympanic membrane was bulging and had a perforation that was choked with a granular mass There were three miliary tubercles in the tympanic membrane Through the intact anteroinferior segment yellowish areas of tuberculous material were seen After the granular mass was extruded through the perforation, there was an increased discharge, which then ceased followed by healing of the drum The membrane was normal except for a thin scar, and hearing was unimpaired The pulmonary lesion also seems to have cleared The second case was that of a girl of 21 who had been under treatment for pulmonary tuberculosis for two years A rupture of the right tympanum followed two weeks after an operation to compress the lung After six weeks of otorrhea, the ear was painful, with profuse mucopurulent discharge A greyish membrane could be seen through a large perforation Much destruction of membrane and ossicles had occurred Tubercle bacilli were recovered from the aural discharge The patient was given 1 gm of streptomycin daily and 12½ grains (0 78 gm) of paraaminosalicylic acid A total of 40 gm of streptomycin was administered in six weeks, at the end of which time the ear was dry and healthy, but with much destruction of membrane and ossicles remaining The hearing, though much diminished, was better than had been expected Streptomycin apparently played a vital part in the improvement of these two patients Early diagnosis and prompt treatment is the most important factor in preservation of hearing and prevention of destruction of tympanic structures

Pathogenesis of Hypochromic Anemia Following Gastric Resection. D Remy —p 346

Thalassanemia in Germany —Heilmeyer and associates present the histories of three patients with characteristic symptoms of the mild form of thalassanemia (familial erythroblastotic anemia), also known as Mediterranean, or Cooley's anemia This anemia is of the hypochromic type The blood smear shows many target cells in the presence of anisocytosis and poikilocytosis, reduced diameter, and reduced volume of erythrocytes The osmotic resistance of erythrocytes in hypotonic solution of sodium chloride is greatly reduced The anemia is resistant to iron therapy but improves noticeably with cobalt therapy Icterus and splenic tumor were absent in the patients described This is understandable in view of the fact that the anemia was mild There were no persons of Mediterranean blood in the ancestry of these patients Thus it must be assumed that this form of anemia may occur in Germans Similar blood pictures were observed in the parents and siblings of two of the patients

Endocrine Disturbances in Tuberculous Meningitis.—The examination of 120 patients with tuberculous meningitis who had been treated with streptomycin, paraaminosalicylic acid, and amithiozone revealed endocrine symptoms, which in view of their multiformity indicated disturbances in controlling centers Four cases are reported in detail One is of a man, 42, with obesity of the general dystrophic type, impotence, and hemianopsia on the left, as well as disturbances in carbohydrate metabolism The second patient, a boy, 16, had dystrophia adiposogenitalis with bluish red striae and impairment of the oculomotor function The third patient, a woman, 26, had marasmus due to diencephalic disturbances with cachexia, hypertrichosis, and left sided hemianopsia The fourth patient, a man, 49, had diabetes insipidus and disturbances in carbohydrate metabolism A review of the literature shows that similar cases occurred earlier, so that streptomycin and the chemotherapeutic substances cannot be held responsible for the development of these symptoms Vascular processes, which nearly always occur in the forms of meningitis and which take a prolonged course, are probably the pathogenic factors in these endocrine disturbances, and they probably cause ischemia and malacia in the region of the sympathetic nuclei of the diencephalon Thus the endocrine symptoms are a manifestation of a disturbance in the diencephalic system

Dogs as Source of Human Infection with Toxoplasmosis —A number of reports in the literature suggest dogs as the possible source of infection in human toxoplasmosis Otten and associates examined 122 dogs for the presence of toxoplasmosis by means of the Sabin Feldman serum dye test The test was positive in 49 dogs This high incidence of positivity is explained by the fact that many of the dogs tested had symptoms suggestive of toxoplasmosis, such as neuritis, partial paralysis, tonoclonic convulsions, and gastroenteritis with diarrhea Some latent infections were found It has been estimated that from 2% to 5% of the dogs in Hamburg are infected with toxoplasmosis The Sabin Feldman dye test was also made on 38 persons who had been in contact with 23 dogs in which this test had been positive Twenty-three of the 38 persons gave a positive reaction to the test Five dog-owners who were tested within eight days of the appearance of clinical manifestations of toxoplasmosis in their dogs gave negative reactions The dogs in question showed the neurological picture of toxoplasmosis Two of six dog-owners, whose dogs had the chronic form of toxoplasmosis with predominantly neurological signs, reacted positively to the test. Six of eight persons who had been in contact with four dogs with acute toxoplasmosis accompanied by severe diarrhea had positive reactions Ten of 11 persons who had been in contact with dogs having a mixed symptomatology indicating neurological and general systemic infection with toxoplasmosis gave a positive reaction Thus it appears that those dogs in which toxoplasmosis produces ulcerative proctitis and diarrhea play an especially important role in the transmission of the disease to humans

Incidence and Form of Primary Cancer of Liver.—The incidence and form of primary cancers of the liver were studied in the necropsy material of the Pathologic Institute of the University of Vienna It was found that cancer of the liver is more frequent in men than in women and that it is particularly frequent in the age group from 50 to 70 Nodular forms accounted for 67% of the cancers and diffuse forms for 33% Histological studies revealed that 76% of the carcinomas were of the hepatocellular and 24% of the cholangiocellular type An apparent increase in the incidence in cancer of the liver, which involved only the diffuse forms, cannot be explained completely by the increased incidence of hepatic cirrhosis and its malignant degeneration nor by the increase in persons in the higher age groups It is suggested that the presence of cancerigenic dyestuffs in foods, such as butter yellow, may play a part. These substances might favor the development of carcinoma in cirrhotic liver, for instance, where regenerative processes are already increased

Sequelae of Radical Gastric Resections —Advances in surgical technique have made possible increasingly radical resections, but the question must be raised whether such extensive eradications are psychologically and physiologically justified The authors investigated in 35 patients the sequelae of total or near total gastrectomies, particularly the failure of the patient in these cases to gain weight and strength and their liability to diarrhea, anemia, and deficiencies of vitamin B complex They list the possible causes of the disturbances observed, chiefly the difficulties of ingestion and defective absorption Follow up observations on 33 patients are summarized Studies on the fat metabolism suggest that the main causes of wasting after radical gastrectomy are poor capacity for food, associated with the dumping syndrome and malabsorption of fat. To compensate for these defects, a diet with a high fat content is recommended From 100 to 120 gm of fat should be eaten daily, with a correspondingly high caloric intake and multiple small meals, so that fat is taken eight to 10 times in the 24 hours The patient should not drink with meals and should avoid sugar, protein hydrolysates and other substances capable of producing a high intrajejunal osmotic pressure, and withdrawing fluid from the bowel, thus causing further distension and perhaps inducing the dumping syndrome With this regimen, some patients in the present series have managed to eat more than their normal pre operative intake and have therefore gained weight The blood picture after radical gastrectomy is characterized by a high incidence of macrocytosis No evidence of iron deficiency was found Vitamin B deficiencies can be prevented by the routine administration of vitamin B complex and by the eradication of septic processes such as the multiplication of organisms in the upper alimentary tract and infections in the subphrenic space or pleural cavity Large doses of nicotinic acid and riboflavin given before and after operation, have reduced the incidence of vitamin B deficiency

Paraaminosalicylic Acid for Tuberculous Cervical Adenitis.—Fifty-one patients with tuberculous cervical adenitis were treated by aspiration of pus and instillation of sodium paraaminosalicylate in the past two years A 10 year survey of results of other methods provided a basis for comparison The abscess was aspirated with a large bore needle inserted directly into its superficial wall The contents were completely evacuated, and up to 1 ml of a 20% solution of sodium paraaminosalicylate was instilled into the abscess cavity through the aspirating needle On withdrawal of the needle very little of the solution escaped, even when under moderate tension Aspiration and instillation were repeated at weekly intervals, until the contents of the abscess cavity became serous and no further pus formed In those cases in which a sinus had formed along the needle track, up to 1 ml of a fairly thick sterile jelly containing 20% sodium paraaminosalicylate was injected through the orifice of the sinus If a sinus ulcer developed, a cream of similar strength was applied superficially and renewed daily until the granulation tissue of the ulcer floor was clean Sodium paraaminosalicylate apparently reduced significantly the area and depth of residual scarring in suppurative tuberculous cervical adenitis More than half the treated patients were cured, with little or no evidence of the original lesion remaining in the skin The healing time was substantially reduced The results in general, compare favorably with those achieved by more active measures (curettage) and the patient need not be hospitalized

Toxoplasmosis in Hares in Denmark.—Since 1935 diseases in wild animals have been systematically investigated in Denmark This made it possible to examine many wild hares found dead in the open field or shot in a sick condition Some of these hares were found to have toxoplasmosis Histological examination showed Toxoplasma in large numbers in the organs with pathological changes (especially the spleen) and also in the brain Toxoplasma strains were isolated by inoculating intraperitoneally into mice 1 ml of a 10% suspension of spleen from infected animals within 24 hr after they had died Toxoplasmosis in hares in Denmark has its maximum incidence in the period January to March It occurs in hares as an acute fatal systemic disease, only a few weak positive serological reactions have so far been found in healthy hares The Toxoplasma of hares appears to be serologically identical with the human strain RH, and is equally pathogenic Consequently, in handling recently dead toxoplasmic hares there is a risk of infection Pregnant women should not handle recently shot hares Animals frozen at —30 C and later thawed do not seem to be infective

Surgical Treatment of Cancer of Rectum—Conservative operations were done in 136 patients with cancer of the rectum, consisting of resection in 31 and total excision with meticulous dissection of the mucosa of the anal canal and transsphincteral lowering of the sigmoid flexure in 105 The most important advantage of the transanal total excision is that colostomy is completely eliminated The abdominosacral approach was used in 115 cases and the sacral approach in 21 There were only 12 operative deaths an operative mortality rate of 8 8% Of 71 patients with cancer of the rectum subjected to nonconservative operations 10 died an operative mortality rate of 14% Late results in patients subjected to conservative operations by lower approach were highly satisfactory since of 19 patients subjected either to resection or to transanal excision, 12 (63%) survived for more than five years while of 52 patients operated on by abdominosacral route only 20 (40%) survived for more than five years A questionnaire was sent to all the surviving patients in an attempt to ascertain the functional results of the conservative surgical treatment Of 70 patients from whom answers were received, 46 had excellent function of the sphincter muscles with complete continence and perfect anatomic condition of the anus, 17 had impaired function, and some required dilatation for stenosis Seven patients had complete incontinence, caused either by sacral fistula with anal stenosis, or complete sloughing of the lowered segment, which required the establishment of a left iliac anus Generally speaking the authors believe that the preservation of the anal function in the exeresis of carcinoma of the rectum is justified

*Effect of Cola Drinks Containing Caffeine D A A Mossel —p 1357
*Transplantation of Ureters into Large Intestine J F Ort and R Sajidiman —p 1366

Action of Cola Drinks with Caffeine Content.—Some cola drinks prepared in the Netherlands contain caffeine in amounts varying from 20 to 75 mg per 200 cc bottle, whereas some other nonalcoholic drinks have no caffeine It should be made obligatory to declare the contents of nonalcoholic drinks on labels As long as it has not been demonstrated that the caffeine that is added to cola drinks is not harmful when these drinks are taken over long periods, children, persons with gastric disorders, and all those for whom caffeine is likely to prove harmful should be advised not to take these drinks The fact that some cola drinks contain phosphoric acid at the very low pH of 2 5 involves the added risk that their consumption may cause dental erosion

Transplantation of Ureters into Large Intestine.—A new technique for the implantation of the ureters into the intestine is recommended The method involves 1 Extraperitonealization of the surgical field 2 Implantation of the extraplevic portion of the ureters, because it is difficult to displace the distal portion with its more or less individual vascularization In this way, the implanted portion of the ureter retains an adequate blood supply and the dangers involved in inadequate circulation are avoided 3 Implantation of both ureters into a receptacle formed from the sigmoid, which is more or less separate from the other portions of the intestinal tract The adequacy of this method is proved by the fact that patients in whom it has been employed are alive and well five years after treatment

*(Pseudo?) Liver Abscess and Tumor of Colon Caused by Lamblia Intestinalis W Beukema —p 1568

Giardiasis as Cause of Liver Abscess and Tumor of Colon—Giardiasis (lambliasis) was discovered in a man, 47, in whom an abscess of the liver developed that perforated through the diaphragm Exudate developed in the pleural cavity, and there was infiltration into the middle lobe of the right lung Two series of treatments with quinacrine hydrochloride resulted in complete clinical recovery The complaints described arose a few months after resection of the colon because of a tumor, which on pathological anatomic examination appeared to consist of nonspecific inflammatory tissue It is possible that this tumor also had been caused by Giardia. The author feels that in cases in which no explanation can be found for serious abdominal complaints, fresh feces and warm duodenal contents should be searched for Giardia Lamblia

Scleroderma—Dreyer deals especially with the internal manifestations of scleroderma While the disease is relatively infrequent, particularly in the generalized form, its varied symptomatology, obscure etiology and pathogenesis, and its relation to other systemic diseases have received much attention in the literature It occurs twice as often in women as in men There are circumscribed and diffuse forms The visceral manifestations appear in the latter Scleroderma with internal changes has a marked chronic course The organs oftenest affected are the esophagus, heart, and lungs The characteristic changes in scleroderma appear in the blood vessels and in the connective tissue The small arteries and arterioles especially are affected, with proliferation of intima, and in recent cases, hyperplasia of media, which gradually is followed by fibrosis of media and frequently by thickening of adventitia In the connective tissue the loose collagenous fibers are transformed into dense homogeneous fibrous tissue, the edema of the tissue seen in the earlier stages is supplanted by a spreading hyperplasia of the collagenous fibrils, with degeneration and atrophy of all other connective tissue elements Since the etiology and in part also the pathogenesis of scleroderma remain unexplained, treatment rests on an empirical basis Scleroderma, though most often progressive, may show definite variations in its course Spontaneous remissions are not unusual, and the disease may remain stationary after a shorter or longer time of development. The view is supported that scleroderma is a systemic disorder localized to the collagenous connective tissue.

Frontal Lobotomy Psychiatric Experiences—Bilateral frontal lobotomy was performed in 1946 and 1947 in 131 patients, aged 19 to 71, with predominantly advanced cases with poor prognosis, in which the usual methods of treatment had brought no lasting benefit There were six deaths Sixteen patients were discharged as able to work, 15 were discharged to their homes, seven to homes for the aged or the like, 49 were more or less improved but not fit for discharge, and five became worse. Observation for an average of over three years showed that complications as described in the literature developed in a number of cases Lasting psychic changes in the form of typical frontal lobe syndrome, with indolence, euphoria, and apathy, were seen in a few instances Frontal lobotomy in selected chronic cases, where other less radical methods of treatment have proved ineffective, is considered a valuable procedure. With interested surgeons good therapeutic results can be achieved with low mortality rates

Frontal Lobotomy Surgical Experiences in 360 Cases.—Report is given on 360 lobotomies performed in a general surgical department, with nine deaths, of which five were due to intracranial hemorrhage, two to meningoencephalitis, and two to marasmus A graduated blunt probe was used, and the incisions in dura were reduced to small punctures. Dura and galea aponeurotica were not sutured Holmdahl states that in most cases the blood pressure sinks momentarily on incision of the white matter and afterward slowly rises Absence of the fall in blood pressure may be a sign of incomplete incision of the white substance Rapid increase in blood pressure after the intervention is an important sign of postoperative intracranial hemorrhage and is an indication for operative revision. More marked hypertension and arteriosclerosis are relative contraindications. Continuous postoperative control of the blood pressure is of the greatest importance. Roentgenologic localization of the ventricular system before the intervention and injection of contrast substance before control of complicating hemorrhage are unnecessary and not without danger

*Carcinosarcoma of Uterus. J C. Ahumada R. Sammartino and L. A. Arrighi.—p 131

Carcinosarcoma of Uterus—In the last 20 years Ahumada and collaborators observed 27,000 patients in a gynecologic clinic of Buenos Aires Carcinosarcoma of the uterus was found in 10 cases (0 04%) The authors define carcinosarcoma of the uterus as a mixed tumor consisting of both carcinoma and sarcoma cells with or without predominance of one type of cell They divide carcinosarcoma into two groups, namely, collision carcinosarcoma and composition carcinosarcoma In collision carcinosarcoma there are distinct carcinomatous and sarcomatous zones in the tumor Where these come in contact there is mutual invasion of neoplastic cells The two tumors appear to originate at separate sites The gross types of tumor most frequently found are diffuse carcinoma and polypoid sarcoma. The predominant histologic types seen in tumors of the cervix are squamous cell carcinoma and polypoid or fibroblastic nodular sarcoma. When the tumor develops in the body of the uterus it assumes the form of cylindrical cell carcinoma and undifferentiated sarcoma. Composition carcinosarcoma of the uterus does not have a characteristic macroscopic appearance Microscopically it shows an intermingling of carcinomatous and sarcomatous cells, either one of which may predominate The symptoms are similar to those of other tumors of the uterus The diagnosis is made by microscopic study of tissues taken by curettage or of the surgically removed tumor The metastases are sarcomatous, carcinomatous, or carcinosarcomatous The treatment is surgical When the tumor is in the cervix the treatment consists of an operation of the type used in cancer of the endometrium When the tumor is in the body of the uterus Wertheim's operation, followed in all cases by x ray treatment, is indicated In the cases reported by the authors the tumor was of the collision type in three cases and of the combination type in seven Tumors of the collision type have a better prognosis than those of the combination type, which are very malignant.

Treatment of Anal and Genital Eczema in General Practice. G H Klövekorn.—p 459
Clinical Experiences with the Combined Administration of Calcium and Vitamin C. E. Stangl —p 460

Abortifacient Effect of Ovarian Hormone Preparations.—In connection with a law suit involving abortion, the question whether ovarian hormone preparations could induce abortion had to be decided. One of the substances in question was an estradiol preparation prepared for oral administration, the other was a fluid extract of the total ovary, which contained all ovarian hormones but was free from protein The latter preparation is indicated for use in sexual infantilism, menopausal disturbances, dysmenorrhea, oligomenorrhea, and amenorrhea Both preparations contain estrin, which increases the blood perfusion of the uterus as well as its responsiveness to the stimulus for contractions A predominance of estrin over its antagonist, the corpus luteum hormone, supposedly is responsible for the induction of labor pains (uterine contractions) This paper presents three cases in which women had taken both of the aforementioned products in efforts to produce abortion The oral estradiol preparation produced neither toxic symptoms nor signs of a beginning abortion However, the intake of the fluid extract of the total ovary was followed by palpitation, tinnitus, vertigo, "blacking out," cold sweat, nausea, and, in one instance, by repeated vomiting Genital hemorrhages followed in all three cases, and, in the two cases in which pregnancy was certain, these hemorrhages were accompanied by spasms resembling uterine contractions and the discharge of a mass or a fetus The fact that no other abortifacients had been used in addition to the ovarian hormones and that the patients had been well before the hormones had been taken and that the abortion followed within two or three days after the intake of the fluid ovarian hormone extract is regarded as indicative of an abortifacient effect To be sure, the fluid extract had been taken in a dosage many times that used in the therapeutic application of this extract

Postoperative Care of Patients with Extrapleural Pneumothorax J Catta G Picard-Leroy and A Massendari —p 763

Transfusion of Morphologic Elements of Blood.—The authors describe the techniques used to separate the morphologic elements of blood from plasma and the therapeutic results obtained from their intravenous administration Red blood cells are separated from plasma by centrifugation and used therapeutically after simple dilution or after several washings with isotonic sodium chloride solution to free them of plasma and white blood cells Leukocytes can be obtained in a concentrated suspension by pipetting off the superficial layer of white cells from the red cells after routine centrifugation This suspension also contains numerous red cells and platelets White cells can further be separated from red cells by polyvinyl pyrrolidone (P V P) sedimentation and from both red cells and platelets by controlled centrifugation The authors gave 80 transfusions of concentrated red cells and 140 transfusions of washed red cells to patients with various anemias and acute leukemias The red cells were more effective and less expensive than whole blood introduced in smaller volume of fluid in patients with circulatory difficulties, and were well tolerated They were especially effective in hemolytic anemias Twenty six transfusions of concentrated suspensions of leukocytes obtained by ordinary centrifugation or polyvinyl pyrrolidone sedimentation were administered to 10 patients with various blood dyscrasias Although the cells were obtained from persons of the same blood type as the patient, chills and fever occurred in several recipients Treatment had no effect in two cases of acute agranulocytosis nor in three cases of acute leukemia There was transitory improvement in a severe case of infantile agranulocytosis and in one case of chronic neutropenia Prolonged improvement occurred in two cases of chronic neutropenia and in one case of aplastic anemia with purpura Following transfusion an immediate paradoxical leukopenia was frequently observed The beneficial effect in these cases was presumably due either to the supplying of essential leukocytic material or to specific stimulation of the bone marrow The crude white cell suspension obtained by ordinary centrifugation was more useful when the patient had a deficiency of all the formed elements, while the purer suspensions were used in simple agranulocytosis

"Flaxedil"— Flaxedil,' or gallamine triethiodide (1 2,3 tri [di ethylaminoethoxy] benzene triethyliodide), is a synthetic curarizing agent It has several clinical advantages over tubocurarine With flaxedil there is a greater margin between muscular relaxation and diaphragmatic paralysis Flaxedil has an equally effective but shorter period of action Its action is more readily and rapidly reversed by neostigmine It does not lower the blood pressure This assessment illustrates that flaxedil is a very versatile and safe muscle relaxant The fact that it is a short acting curarizing agent with an effective antidote has widened the field of application for this type of drug Its short period of action is not only one of its main advantages but also its main limitation Though it can be used for prolonged relaxation and for control of respiration, for frequent injections, the longer-acting tubocurarine seems to be more suitable Flaxedil's one main disadvantage—tachycardia—has been observed in many patients under thiopental sodium, nitrous oxide, and oxygen anesthesia, but not to the same extent under cyclopropane Though the rapid pulse may be disquieting to the anesthetist, and may, in theory, mask danger signals of the patient's general condition these investigators have been unable to attribute to tachycardia any undesirable effects

*Treatment of Cancer Inhalations of Vapor of Overheated Ether Preliminary Note W Treuherz.—p 151

Treatment of Cancer—The vapor of overheated ether has been found to have bactericidal effects on tubercle bacilli in cultures (Fornet) and beneficial effects, when inhaled, on cancer and metastases (Tiegel) This is due to its ability to dissolve cholesterol and lipoids, which are encountered in tubercle bacilli and in tumor tissues When ether is heated to 60 C it yields a vapor with 1,722 mm Hg of pressure Before this is administered to the patient it is allowed to expand so that it becomes diluted and cooled to 40 C The body retains 75% of the inhaled ether, and 25% is eliminated by expiration The blood serum of patients with cancer absorbs 11 volumes of heated ether vapor while the serum of normal persons absorbs only 1 to 3 volumes The author administered inhalations of vapor of overheated ether to 43 men and women with very advanced cancer and metastasis He used Tiegel's technique with his own modifications Most of the patients were in a desperate condition and had failed to respond to x rays and radium The treatment has the following advantages 1 It is harmless Neither unpleasant effects nor secondary reactions were observed in more than 500 inhalations administered 2 In all patients the general condition of health and activity improved, vomiting, anorexia, the subjective symptoms, pain, and hemorrhages disappeared The patients gained an average of 5 5 kg in two months 3 The hemogram improved in some cases 4 Intestinal tumors became smaller or disappeared 5 Stenosis of the esophagus disappeared in 20 days in one patient, who had been able to drink only water and who is now able to eat all kinds of food No changes were noted in the metastases in the bones The author suggests further work on the effects of vapor of overheated ether and other anesthetics His article is a preliminary report

Pneumoperitoneum in Treatment of Pulmonary Tuberculosis S J Leitner —p 175
Combination of Intrapleural and Extrapleural Pneumothorax. L. Adelberger and H Blaha —p 193
*Extrapleural Pneumothorax Combined with Antibiotic Therapy in Pulmonary Tuberculosis with Cavity Formation E Herrmann.—p 205

Pneumothorax and Antibiotic Therapy.—This paper reports observations on 49 patients with cavernous pulmonary tuberculosis in whom extrapleural pneumothorax was induced in connection with antibiotic therapy During a preparatory period of at least two months, the patients were treated with paraaminosalicylic acid, and treatment with streptomycin was begun at least four to 10 days before the induction of pneumothorax and was continued during the pneumothorax treatment until the exudate had been absorbed Comparison of these 49 patients who received combined therapy with 49 who were treated with pneumothorax without the addition of antibiotics during the years between 1939 and 1943 revealed that it was possible to extend the indications for collapse therapy Other advantages were that the exudate disappeared rapidly, so that the formation of adhesions was prevented and the respiratory function of the noncollapsed portion of the lung was preserved, also, because the pneumothorax does not shrink much, it does not have to be very extensive and thus more of the respiratory surface is preserved. These factors lessen the technical difficulties and reduce the need for secondary plastic operations after the pneumothorax is terminated The fact that treatment with antibiotics prevents the formation of empyema is highly important, because the empyema not only exerts an unfavorable influence on the immunobiologic condition, but it also makes the pneumothorax rigid and ineffective The pneumothorax treatment is made simpler and less hazardous by the addition of antibiotics, because limitation of complications reduces the number of refills necessary

*Diverticulitis of Sigmoid Flexure and Perisigmoiditis Eighteen Cases Treated Operatively J J Jacobsen —p 1311
Operative Treatment of Chronic Hepatitis. J Ernst.—p 1317
*Clinical Observations on Craniotabes Material from Two Child Welfare Stations in Copenhagen. K. *Blom.—p 1326*
Treatment of Acute Barbiturate Intoxication J Røjel —p 1335

Diverticulitis of Sigmoid Flexure and Perisigmoiditis.—Jacobsen discusses 18 cases of complicated diverticulitis and perisigmoiditis treated operatively, in eight men and 10 women, aged 37 to 70 Localized peritonitis was present in one case, vesicocolic fistula in one, peridiverticulitis in two, large extraperitoneal abscesses in two, and stenosing perisigmoiditis in seven Of the eight postoperative deaths four were due to diffuse peritonitis and four to intoxication and poor general condition In addition to the danger of local complications in these cases the presence of an infectious focus in the organism involves the risk of septic complications The first step in the treatment of perisigmoiditis should usually be the formation of an artificial anus, further treatment depends on the complications In most cases there were multiple symptoms In perisigmoiditis differentiation from cancer of the colon is difficult. While roentgen examination affords valuable information, it rarely gives certain diagnosis Diverticulosis is not believed to predispose to cancer of the colon, but because of the frequency of the two affections they will occasionally occur together

Craniotabes.—Blom reports that of 662 children examined at two children's welfare stations 83 (12 6%) had craniotabes The results support the assumption that craniotabes is not of rachitic but is of physiological nature Prophylactic administration of cod liver oil to mothers and children did not prevent craniotabes but prevented rickets Craniotabes is thought to be an osteoporosis due to high growth intensity The parietal bones are most commonly affected, perhaps as the place of least resistance, since they are exposed for the longest time to the greatest intrauterine and postnatal pressure

*Clinical Results Technique and Pathological Anatomy of Procaine Hydrochloride Infiltration of Frontal Cerebral Lobe in Cancer Patients with Intractable Pain. F Mandl F Paul, W Gyri and R. Jelinek.—p 304
Atrophy of Neck of Femur A Saxl —p 308

Procaine Infiltration of Frontal Lobe for Relief of Intractable Pain.—Fourteen patients with carcinoma of the uterus, larynx, and rectum, and bronchial carcinoma submitted to procaine hydrochloride infiltration of the frontal cerebral lobe An injection of up to 15 cc of a 1% solution of procaine hydrochloride was made through a trephine opening in the sagittal plane from a point 3 cm in front of the coronal suture and 3 cm laterally from the midline toward the upper orbital vault In most of the patients intervention was performed on the ipsilateral side to the focus of pain Results were excellent or satisfactory in seven patients, encouraging in three, doubtful in one, and poor in three The complications sometimes following lobotomy did not occur in any of the patients Three patients who obtained only temporary relief from pain (partial results) required repeated infiltration, which was performed transcutaneously through the old trephine opening except for one patient in whom ossification of the old opening had occurred within five weeks Experiments on cadavers with a solution of methylene blue for infiltration of the frontal lobe showed that there was no discoloration of the adjacent portions of the brain The stain spread only over the convexity and over the base of the brain Additional experiments on cadavers demonstrated that infiltration with the described technique is not dangerous and that the injection needle is never in contact with the anterior horn of the lateral ventricle Necropsies performed on four patients demonstrated that the pressure of the injected solution produces a mechanically conditioned, hemorrhagic softening of the brain substance, the extent of which apparently varies with the amount of pressure applied It is suggested that the analgesic effect of the infiltration may be due to this destruction of the pathways in the frontal lobe and probably does not depend on the type of the anesthetic used

QUERIES AND MINOR NOTES

ADIE'S SYNDROME

To the Editor —*A woman, 43, an immigrant from Germany, was first seen Sept 2, 1950, complaining of increasing night blindness for two months without other ocular or systemic symptoms Past history revealed hypertension to 170 systolic, treated with pills in Germany, a tonsillectomy performed one year ago for recurrent 'sore throat" and one full term normal pregnancy The patient's weight is 143 lb (64 9 kg) and her blood pressure is 150/90, left arm, sitting The pupils are equal and react normally to light and accommodation The visual fields are normal by confrontation, the visual acuity is 20/20 bilaterally The fundi are normal Neurological examination is normal, except that knee and ankle jerks are absent The hemoglobin is 13 gm The blood smear is normal On Oct 21 the patient stated that friends had noted unequal pupils and that night blindness was unchanged The left pupil was found to be larger than the right and the left pupil had no direct or consensual reaction to light or to accommodation Results of a Kline blood test had been reported negative On Feb 17, 1951, a spinal puncture was done, revealing clear fluid, with one lymphocyte The fluid was Nonne negative, the total protein 32 mg per 100 cc, and the Wassermann and colloidal reactions negative Routine skull x rays, taken the same day, were normal This was considered to be a case of Adie's syndrome*

John T Harbaugh, M D, St Paul

Answer —The diagnosis of Adie's syndrome in this case is certainly correct The majority of affected persons are females who are apparently healthy otherwise. The onset is usually sudden, and the condition is permanent The size of the tonic pupil, however, varies from time to time and may even become smaller than its mate The tonic pupil is unilateral in 80% of cases and most often left sided, as in this patient Unlike the true Argyll Robertson pupil, the tonic pupil dilates normally with mydriatics (atropine, homatropine, cocaine) In 1940 Scheie introduced a specific test, the reliability of which has since been firmly established. The instillation of 2 5% methacholine produces a contraction of the tonic pupil, whereas the normal pupil is not affected by this concentration The hypersensitivity of the tonic pupil to cholinergic drugs apparently indicates that the lesion is in the ciliary ganglion or is peripheral thereto

Adie thought the affection was due to a disease of the vegetative nervous system Lowenstein and Friedman consider the malady a heredodegenerative disturbance affecting the vegetative centers of the diencephalon and their connections with the mesencephalon James ascribed the condition to general nervous asthenia Jeliffe observed a tonic pupil and areflexia (loss of knee and ankle jerks) in a woman with hypothyroidism, which responded to the administration of thyroid Kennedy showed that the syndrome may be associated with anxiety neurosis and that freedom from nervous tension in such instances resulted in improvement

In the case cited the therapeutic test indicated that the night blindness was not due to avitaminosis Night blindness due to vitamin A deficiency is usually observed in persons less than 20 years old and is extremely rare in this country Night vision is normally best if the refractive status is that of mild hyperopia The tonic pupil may be associated with tonic accommodation and consequent adventitious myopia Night blindness is frequent in all neurotic cases, especially anxiety neuroses, in which a reversion to the childhood fear of darkness evidently occurs In the recent war night blindness of this type assumed almost epidemic proportions in the combatant armies

PUPILLARY INEQUALITY

To the Editor —*A 7 year old girl, under treatment for migraine which centered around the right eye was referred to me because of a dilated right pupil which reacts minimally to light and has apparently normal accommodation Vision is 20/20 with or without a minimal hyperopic astigmatic correction There was no apparent change in the right pupil before or after cycloplegic examination The Wassermann reaction, sedimentation rate, results of neurologic examination, and routine skull x-rays were normal There is no history of trauma The child is apparently normal except for this dilated right pupil Does Adie s syndrome occur in children? Would a vascular entity cause more symptoms?*

M D, Minnesota

Answer —Adie's syndrome has been observed in a child 5 years of age, in whom pupillary inequality was observed at 6 months The syndrome is characterized by unilateral enlargement of the pupil with the direct and indirect light reflex almost completely abolished The pupil further dilates in the dark and slowly contracts in a brightly illuminated room During accommodation-convergence after a delay which may be as long as five minutes, the abnormal pupil slowly contracts until it may be smaller than the fellow pupil There may be an associated loss of tendon reflexes The tonic pupil contracts with 2 5% methacholine, which does not affect the normal pupil in this concentration

Analysis of the cause of the pupillary dilation in this patient requires the following additional information (1) length of time condition has been present, (2) nature of the migraine, (3) range of accommodation in each eye, (4) direct and indirect light reflex of both eyes, (5) fields of vision, and (6) pharmacologic response of the pupils The following conditions are suggested (1) Adie's syndrome, (2) ophthalmoplegia interna, (3) paralytic mydriasis, (4) congenital mydriasis, and (5) adrenergic nerve irritation

An excellent review of the pupillary reflexes and their abnormalities is contained in the work by Walsh (Clinical Neuro-Ophthalmology, Baltimore, Williams & Wilkins Company, 1947)

IMPAIRED HEARING

To the Editor —*One of my ears has incurable nerve deafness Every winter my other ear becomes affected with eustachian closure, with resulting partial deafness This clears up within a month or so, and hearing improves I have had four treatments with radon applicators over the fossae of Rosenmueller (three years ago) with great relief The attacks now last longer and are not so amenable to treatment I have desensitized myself with graduated histamine injections and recently seemed to be helped with 100 mg of cortisone in tablet form for two days What is the present accepted treatment in this disturbing condition? What is the prognosis? What climate is most favorable in prevention of the annual recurrence of this apparently seasonal (damp weather) condition?*

M.D New York

Answer —Impaired hearing due to eustachian tube closure may be caused by hypertrophied adenoidal tissue around the tubal orifice, by an allergy, particularly to house dust, by neoplasm in the nasopharynx (usually carcinoma), and by temporomandibular joint malocclusion as a result of replacement of the molar teeth with dentures that do not give the proper support to the bite

The treatment of eustachian tube occlusion is removal of the causative factor, if possible, and inflation of the eustachian tubes If there is an accumulation of serum in the middle ear, paracentesis followed by inflation may be indicated In this case, an allergy to house dust would seem possible, in which case desensitization with minute dosage therapy, as described by Hansel

---

The answers here published have been prepared by competent authorities They do not, however represent the opinions of any official bodies unless specifically stated in the reply Anonymous communications and queries on postal cards cannot be answered Every letter must contain the writer s name and address but these will be omitted on request.

would be worth trying. In cases of allergy to house dust, the best climate is one with warm, clean air, best found in southern Florida or the Caribbean Islands rather than in New Mexico or Arizona, where there is much dust.

The prognosis is generally good, although rare cases may be very resistant to treatment. As a rule, the hearing can be restored to normal by establishment of normal ventilation of the eustachian tube. Rarely, in long standing cases, permanent adhesive changes in the middle ear develop, with a permanent hearing impairment.

TESTS FOR CORONARY INSUFFICIENCY

To the Editor:—*I would greatly appreciate it if you would have several competent authorities discuss the relative merits of the Levy test and the Master test, which are used in the detection of coronary insufficiency in patients whose histories are not definite enough to make such a diagnosis from their symptoms. I would appreciate a discussion of the use of these tests in the detection of "latent" coronary insufficiency in patients who give no history suggesting coronary insufficiency but in whom it is desired to ascertain an accurate picture of their coronary function prior to their undergoing strenuous physical effort.*

M.D., Washington.

Answer.—The anoxemia (Levy) and exercise tolerance (Master) tests are used to induce a relative lack of oxygen supply to the myocardium. The former does so by producing hypoxemia secondary to inhalation of a low oxygen gas mixture; the latter increases the work of the heart and thus, in conditions where coronary blood flow cannot be increased sufficiently, leads to relative coronary insufficiency and hence a decreased oxygen supply to the heart. Since both tests utimately evaluate the same functional deficiency and vary only in the manner of its production, many of their indications, merits, and demerits are the same. Both tests should be conducted only by well qualified physicians, because of the inherent danger of producing arrhythmias and even myocardial infarction. The anoxemia test requires special, although relatively simple equipment, while the two step exercise tolerance test requires only a wooden step. The anoxemia test has the advantage of immediately providing 100% oxygen inhalation, if necessary, while the exercise, once performed, may continue to increase the work of the heart even when the exercise is stopped. On the other hand, the exercise tolerance test simulates the type of strain on the heart that so often produces the symptoms in the patient. From wide experience in the past, the exercise tolerance test is well standardized in terms of the number of steps to be taken and of electrocardiograms that are considered "positive." It is the opinion of many physicians who have used both that the anoxemia test is more dangerous and also less comfortable for the patient.

Even without previous symptoms, these tests may show abnormal results in a given patient. Such results should certainly be taken as a warning against strenuous physical effort. However, the normal response to either of these tests should not per se exclude the possibility of coronary insufficiency, and the patient's condition as a whole must be considered. "False negatives" certainly occur, even in patients with proved coronary disease. "False positive" tests, such as are reported in anxiety states, are rare.

ACID SALTS AND EDEMA

To the Editor:—*A hypertensive patient has had a coronary and recurrent decompensation. It has been necessary to give mersalyl (salyrgan®) intravenously almost daily to keep ahead of his edema. In desperation the family tried a home remedy of boric acid crystals and cream of tarter mixed with water and taken by mouth. Surprisingly this concoction has kept the patient free from edema for two weeks. I am curious to know whether there is any scientific background for such therapy.*

Archie S. Narotzky, M.D., Ishpeming, Mich.

Answer.—Acid salts have been used for years in the treatment of nephrotic edema. It may well be that boric acid crystals and potassium acid tartrate have a diuretic effect, due not only to their acid properties but also to the potassium. Ever since Bunge's original work in the last part of the 19th century, which showed the antagonism between the retention of sodium and potassium, potassium has been used in the therapy of patients with edema. Without the dosage of either the boric acid or cream of tartar being specified, comment on the advisability of the therapy used is difficult. Serious poisoning can result from the ingestion of 5 gm. of boric acid. The toxic effects include nausea, vomiting, abdominal pain, diarrhea, visual disturbances, renal injury, collapse, and, occasionally, death. Its use in a chronic condition would appear to involve considerable risk. Tartrates are poorly absorbed from the gastrointestinal tract and are therefore sometimes employed as cathartic. If tartrates are absorbed into the circulation, they may produce renal damage. Cream of tartar, therefore, in the treatment of a chronic renal condition would also appear to involve considerable risk. It seems pertinent to remark that injury to the kidneys of an edematous nephrotic patient may result in a diuresis, with the impression of improvement in the renal disease though the apparent beneficial effect is the result of accentuation of renal disability.

DAMAGE CAUSED BY BORON COMPOUNDS

To the Editor:—*Can either allergic rhinitis or dermatitis of the face be produced in industry where both boric acid and borax particles fill the air?* *M. H. Brodkey, M.D., Omaha.*

Answer.—Repeatedly since 1881, boron compounds have been reported as causative of both surface and systemic damage. Injury has followed ingestion, hypodermic injection, enemas, pleural lavage, ointment application and industrial exposure. Hypersusceptibility is the rule, but susceptibility did not enter as a factor in a series of fatal cases in which boric acid solution accidentally was substituted for water in nipple bottles for infants. Exposure may be acute or chronic, and the consequences likewise may be acute or chronic. Currently the commonest lesion is that of eczematous dermatitis, with the chief location about the face. Present day concepts of sensitization imply that almost any agent capable of producing a surface lesion may, through tissue damage, create a specific allergy. On this basis a boron induced allergy becomes tenable, but this is not the usual form of damage.

TINNITUS

To the Editor:—*In 1949, while flying with a mild head cold, I contracted aero-otitis; ever since I have had a soft humming sound in both my ears and at times a feeling of fulness. Six months later, I had some x ray treatment to both ears involving 40 r on three or four occasions, in an attempt to shrink the lymph nodes in the posterior pharynx. This did not help. I then had a complete physical examination with no pathological findings; my hearing was perfect. I have noticed that my ear condition definitely depends on humidity changes; during dry days I am about free of humming sounds and fulness. I shall appreciate greatly information on treatment. I am 40 years of age.*

M.D., Indiana.

Answer.—Tinnitus is a symptom of various types of middle and inner ear pathology. When there is a reversible condition, such as aero-otitis, suppurative otitis media, or perforated tympanic membrane, the tinnitus is frequently relieved by relieving the underlying condition. More often there is no reversible pathology in the inner or middle ear, and in these cases there is no effective treatment for tinnitus. Since, in your case, the aero-otitis has long since cleared up, the tinnitus would fall into the latter classification.

THIAMINE INJECTIONS FOR FIVE YEARS

To the Editor:—*For five years a bank executive has had three or four hypodermic injections weekly of thiamine hydrochloride in 100 mg. doses without any apparent detrimental reactions. He claims it energizes him. Is there any danger in the continuous use of this vitamin?* *M.D., New York.*

Answer.—Thiamine hydrochloride is believed to have no toxic effects. The requirement for the average person is small, perhaps less than 2 mg. daily. When needed, however, this vitamin is given in much larger amounts, often 100 mg. or more daily. As much as 25,000 times the actual requirement has been given without harmful effect. The amount taken by this patient, 100 mg. four times weekly could apparently have no harmful effect. However, one wonders about the continuance of this procedure for five years. There is a psychological element here that cannot be ignored. Why not advise him to get his vitamins from food?

NICOTINAMIDE

To the Editor.—*Why does nicotinamide relieve certain cases of vertigo? Has nicotinamide ever been reported to produce undesirable symptoms in heavy doses? Would 200 mg. four times daily be considered an overdose? Could 400 mg. daily by mouth for three weeks produce precordial pain and constriction referred to the left side of the back?*

M.D., New Jersey.

Answer.—Vertigo may be one of the symptoms of pellagra, and in such cases the administration of nicotinamide would be of help. "Undesirable symptoms" have not been reported as resulting from reasonably heavy doses of this substance. A dose of 500 mg. each 24 hours is regarded as a good average amount, but 1 gm. daily has been given over a period of several weeks without injurious effects. The substance is usually well borne. There appear to be no reports of intolerance to its continued administration which would produce "precordial pain and constriction referred to the left side of the back."

PSORIASIS IN A VIOLINIST

To the Editor.—*A male violinist, 25, wishes to study the instrument in order to play it professionally. He has a patch of psoriasis on an elbow, two on the occiput, and has slight psoriatic involvement of three nails of each hand. His mother has psoriasis, but there is no family history of rheumatoid or psoriatic arthritis. He states that if arthritis is likely to develop in the ratio of 1 to 5 he will discontinue his study now rather than gamble on being disabled later after years of working toward eminence. What is the incidence of psoriatic arthritis in the finger joints of persons who have psoriasis of the nails?*

M.D., California.

Answer.—Both psoriasis and arthritis are common diseases. For one to determine the relative incidence of psoriatic arthritis as compared to other types of arthritis, a long term study of innumerable patients with both diseases would be required. Then, too, the clinical course of psoriasis is unpredictable. Fortunately, in most cases, the psoriasis constitutes little more than a cosmetic problem. There seems to be no reason to suspect arthritis of the finger joints to develop oftener in persons with psoriasis of the nails. If this young man has unusual talent and a great desire to become an eminent violinist, he should be encouraged to continue his studies.

NEPHROTIC SYNDROME

To the Editor.—*A 44 year old white woman has acute glomerular nephritis of two months' duration, which has now entered a nephrotic stage with reversal of the albumin globulin ratio, constant albuminuria (4 plus) and moderate edema which cleared with bed rest and salt free diet. Is the use of pituitary adrenocorticotropic hormone (ACTH) or cortisone indicated?*

John M. Butcher, M.D., Sarasota, Fla.

Answer.—The place that cortisone and pituitary adrenocorticotropic hormone will finally occupy in the treatment of acute glomerulonephritis or the nephrotic syndrome has not yet been established. Some investigators report good results, whereas in other hands these hormones have resulted in definite metabolic changes without apparently influencing the course of the disease. Patients with the nephrotic syndrome who have apparently had good results have, in certain instances, subsequently had a recurrence of edema. If edema can be controlled by dietary and other established measures, then this would be preferable, as there is no evidence that these hormones remove the renal lesion.

BYSSINOSIS

To the Editor.—*I have an industrial case with a question of death being secondary to byssinosis. Can you give me any information regarding this?*

M.D., Michigan.

Answer.—Byssinosis, commonly called "mill fever," is a pulmonary infection of low severity arising among cotton mill workers, chiefly in Europe. This disease has been variously associated, as to cause, with bacterial and fungal infection, allergy, and the toxin of Aerobacter cloacae (Prausnitz, C.: Medical Research Council, Special Report Series, No. 212, His Majesty's Stationery Office, 1936. Bolen, H. L.: *J. Indust. Hyg. & Toxicol.* 25: 215 [June] 1943).

PSORIASIS

To the Editor.—*A young woman began taking capsules of undecylenic acid for psoriasis, and after two days, complained of a rash of fine small punctate erythematous macules and papules on the face, neck and forearms. The patient being of a nervous disposition, I advised discontinuance of the undecylenic acid, pending inquiry, and substituting tripelennamine hydrochloride locally and internally. 1. Can one expect that such rash would disappear along with the old psoriasis lesions if one disregards these new papules and continues the undecylenic acid treatment for psoriasis? 2. Does undecylenic acid aggravate or precipitate new lesions? These are too immature to identify as psoriasis. 3. Is ACTH or cortisone to be regarded as the best available treatment of psoriasis? 4. Has aureomycin caused an allergic rash?*

W. J. Wakefield, M.D., Vienna, Ill.

Answer.—Experience in a large series of patients shows that undecylenic acid has no value whatsoever in the treatment of psoriasis. In some patients the psoriasis apparently has been aggravated by the use of undecylenic acid. Pituitary adrenocorticotropic hormone (ACTH) or cortisone relieves the patient of the psoriasis temporarily, however, when the drug is discontinued the psoriasis recurs, sometimes more extensively than before treatment was started. Aureomycin has produced few cutaneous reactions.

CHLOROPHYLL

To the Editor.—*What is the scientific explanation for the use of chlorophyll as a deodorant when taken internally and when used in the form of an airwick for odors in a room?*

G. Horace Coshow, M.D., Carpinteria, Calif.

To the Editor.—*Is there any known harmful effect if chlorophyll is taken internally for purposes of deodorizing secretions or breath? Is there a maximum daily dosage? If there are any known harmful effects, what organs may be affected?*

W. F. Holmes, M.D., Walla Walla, Wash.

Answer.—Chlorophyll as it occurs in plants is unstable, and the commercial preparations used as deodorants are modified derivatives of the green coloring matter of plants. Studies by Moss, Morrow, Long and Ravdin (*J. A. M. A.* 140: 1336 [Aug. 27] 1949) have shown that a chlorophyll derivative will deodorize foul-smelling wounds. This action did not appear to be due to destruction of bacteria, since this chlorophyll preparation was not an efficient antiseptic. The apparent mechanism of action is probably one of adsorption or possibly oxidation or reduction of the odorous substances.

No satisfactory explanation has been offered for the deodorant effect of orally administered chlorophyll derivatives reported by Westcott (*New York State J. Med.* March 15, 1950). Kohler, Elvehjem and Hart (*J. Biol. Chem.* 128: 501 [May] 1939) reported that chlorophyll was not absorbed from the gastrointestinal tract, and there is no evidence available as yet that identifiable derivatives of chlorophyll are present in body fluids or in the urine after ingestion of chlorophyll.

It is generally believed that most body odor is due to bacterial decomposition of sebaceous secretions on the skin. There is no evidence that chlorophyll decreases this secretion or alters the bacterial flora of the skin. Furthermore, satisfactory control tests have not been made with chlorophyll taken internally as a deodorant, thus, not only is the mechanism of action unexplained, but it is not at all certain that the action exists except in the mind of the observer

There is no evidence that chlorophyll or the available derivatives have any harmful action Furthermore, it should be remembered that chlorophyll is a fairly constant constituent of a well balanced diet which includes green vegetables Finally, one should consider the fact that many herbivorous animals, including the goat, consume large quantities of chlorophyll, and some of these are noted for their pungent aroma

ALOPECIA UNIVERSALIS

To the Editor —*What treatment if any, is available for alopecia universalis? I have in mind a woman, 50, who suddenly lost all the hair on her body, probably from a severe mental shock* *Edward B Tyson, M D , Ocean City, N J*

Answer —The treatment of alopecia universalis is altogether unsatisfactory One occasionally observes some spontaneous regrowth of hairs, and at times one hears of an encouraging result from the use of hormone therapy In general, however, the cause is obscure and treatment meets with failure

PREGNANCY FOLLOWING ILEOSTOMY

To the Editor —*A woman, 27, has one living child, 5 years Since the birth of this child, the patient has had a permanent ileostomy, because of colitis with a complete colectomy She is desirous of becoming pregnant again Would there be any danger in any way if she becomes pregnant?*

Nerio W Pioppi, M D , Southbridge, Mass

Answer —This patient may safely become pregnant and be permitted to have a vaginal delivery A case report entitled ' Successful Pregnancy Following Ileostomy with Partial Colectomy for Ulcerative Colitis" was published by Kenneth W Warren in the *Lahey Clinic Bulletin* (5 202 [Jan] 1948)

THE OSCILLOMETER AND SKIN TEMPERATURE MEASUREMENTS

To the Editor —*What errors are associated with the use of an oscillometer, and how accurate is this machine in detecting suspected peripheral arterial disease? Are fewer errors apt to be associated with skin temperature measurements?*

Paul Russell, M D , Inglewood, Calif

Answer —Assuming that the oscillometer is mechanically correct, it registers occlusion or loss of elasticity in the pulsatile part of the peripheral arterial tree, the height and the shape of the oscillometric curve, together with the visible thrust or wormlike movement of the needle, permit a great many conclusions by an experienced observer, especially if differences are detected at symmetrical levels of the two extremities The instrument does not detect any changes in digital circulation or disturbances in arteriolar flow Skin temperature measurements, in the absence of a room with controlled temperature and humidity, can have only comparative value when one symmetrical area is tested against the other or when the effects of release of vasomotor tone is studied

DWARFISM

To the Editor —*The answer to a query in the June 16, 1951, issue of* The Journal *did not fully explore the diagnostic possibilities in the case of an underdeveloped child with glycosuria, despite a normal blood sugar content, and albuminuria in the presence of an otherwise normal urine In the answer it was presumed that renal dwarfism existed However, a rare hereditary defect of the proximal tubules of the kidney has been described by Fanconi which could explain the findings noted in the above case In the Fanconi syndrome there is a defect in the phosphorylating mechanism with resultant inability to reabsorb glucose amino acids, and phosphate from the glomerular filtrate This leads to a loss of these substances in the urine and a negative nitrogen and phosphorus balance with consequent impaired growth underdeveloped musculature and osteoporosis Fractures can occur from minor trauma and prolonged fasting can produce hypoglycemic symptoms McCune and co-workers reviewed the literature of this disorder (Am J Dis Child* **65** *81, 1943)*

PERSISTENT SALTY TASTE

To the Editor —*In* The Journal, *June 16, 1951 (page 689) Dr Robert A Marks asks for the cause of a persistent salty taste in the mouth of a 57 year old white man He stated that the symptoms started after teeth had been removed for pyorrhea,' and persisted after he was fitted with a full upper and lower denture The most likely cause was omitted in the answer A persistent salty taste in the mouth is caused by an antral-oral fistula until proved otherwise Such fistulas may be difficult to locate, as they are often in a tissue fold under the denture The salty taste is caused by the secretions of the maxillary sinus entering the oral cavity Before this man is sent to a neuropsychiatrist, as is suggested in the answer, he should be sent to a competent oral surgeon who could determine whether such an antral-oral fistula is present This is especially likely in this case because it occurred after the removal of teeth for pyorrhea' (a better term is periodontoclasia) It is also stated in the answer that there may be a ' lowered sensitivity to taste—especially if the palate is covered by a plate " There are no taste buds in the hard palate which is covered by a denture The answer to a query in* The Journal *of Sept 17, 1949 (page 237), regarding a salty, bitter taste also omitted the statement that salty taste is almost pathognomonic of an antral-oral fistula*

IMMUNITY AGAINST DIPHTHERIA

To the Editor —*I am taking the liberty of writing an addendum to the reply to a query in* The Journal *on immunity against diphtheria (April 8, 1950, page 1115) While there is no doubt that toxoid is effective in stimulating the appearance of antitoxin in the blood, there is considerable evidence that this does not necessarily confer immunity There is far too much tendency to confuse antitoxin in the blood stream with immunity and to use the two terms interchangeably That antitoxin in the blood does not necessarily confer immunity is shown by the development of diphtheria in persons receiving antitoxin a short time before onset There are also several reports of diphtheria in many persons supposedly adequately immunized" (Schick negative) with toxoid (Merkel, A E An Outbreak of Diphtheria in Medford Oregon, 1949, Am J Pub Health* **41**.*522 1951) On the other hand, many normal adults (around 30%) give a positive reaction to the Schick test yet diphtheria is uncommon in adults even when they have been exposed to the disease (although there is some indication that the age distribution of the disease may be higher than formerly) Of much greater significance in immunity to diphtheria is ' tissue resistance, an allergy like, binding reactivity of tissues toward the diphtheria bacilli themselves This is very potent and is wholly independent of antitoxin (Frobisher M , Jr , and Parsons E I Studies on Type-Specific Immunization with Somatic Antigens of Corynebacterium Diphtheriae Am J Hyg* **52** *239, 1950)*

With respect to the query referred to above, I believe that the immunity to diphtheria that follows the natural disease is far more effective than that which follows injections of bacillus free toxoid because the patient develops tissue resistance as a result of contact with the bacilli, as well as antitoxin resulting from contact with toxin This is the reason that as pointed out in the previous reply to the query, Authentic second attacks of diphtheria are rare

SURGERY OF THE ADRENALS

Charles Huggins, M D
and
Delbert M Bergenstal, M D , Chicago

The purposes of surgery of the human adrenal glands are to remove neoplasms of these structures or to abolish functional activities which are deleterious to the organism, both conditions may be coeval The principle of abolition of dangerous physiological functions of the adrenals, of course, is the opposite to stimulation of these glands by a corticotrophic agent, for example, corticotrophin (ACTH) There are several clear indications for the removal of nonneoplastic adrenals at present, no doubt more will be found, and the subject will assume greater importance Frequently disease conditions caused by adrenal hyperfunction or those mediated through normal activity of these glands can be cured or alleviated by surgical procedures, with impressive results

Adrenal surgery is now in a fast-moving evolutionary stage Recently there have been four major developments in this area These are (*a*) methods of maintenance of life in the absence of the adrenal glands or in adrenal insufficiency, (*b*) highly valuable diagnostic procedures for the assay of adrenal functions, (*c*) improved technical surgery of the adrenals, and (*d*) experimental production of adrenal cortical tumors

The present paper is a brief and necessarily incomplete survey of the indications for surgery of the adrenals and includes a statement of the technical aspects of the operation and the essential medical management thereafter

PATHOLOGICAL PHYSIOLOGY OF THE ADRENAL

During embryonic life mesodermal cells in the region of the wolffian body near the genital ridge grow out and encase cells of the sympathetic nervous system derived from ectoderm to form the adrenal cortex and medulla respectively Many of the medullary cells bind chromate ion strongly (chromaffin tissue) while others resemble sympathetic ganglion cells

The most striking clinical effects of medullary hyperfunction are sympathomimetic, chiefly vasopressor in type Two hormones, l-epinephrine and l-norepinephrine [1] have been isolated from the adrenal medulla and from pheochromocytomas [2] Both substances cause elevation of systolic blood pressure but differ in certain other respects In brief, the administration of l-epinephrine causes little change in diastolic pressure, a decreased peripheral resistance, increased cardiac output, and tachycardia, l-norepinephrine causes elevation of diastolic pressure, increased peripheral resistance, and usually bradycardia [3] Goldenberg [4] has postulated that the rather wide range of symptoms observed in patients with pheochromocytoma is explainable on the basis of the varying amounts of l-epinephrine and l-norepinephrine, respectively, secreted by the tumor

The normal adrenal cortex is rich in ascorbic acid and in lipids, including cholesterol and other steroids, of which many have been isolated Of greatest significance in cortical hyperfunction is the elaboration of androgens, estrogens, and corticoids, such as the 11-oxygenated steroids (cortisone, 17-hydroxycorticosterone) Significant amounts of compounds of these types have been found in extracts of the adrenal cortex or the urine of patients with cortical tumors Cortisone has some effect on nearly every tissue,[5] exerting strong effects on the metabolism of carbohydrate and protein, but it has much less influence on electrolyte and water balance [6]

As Kenyon [7] has pointed out, certain signs and symptoms of adrenal tumors have been reproduced to some extent by the administration of pure steroids, (*a*) hypertension by desoxycorticosterone acetate (doca®), (*b*) sodium and water retention by desoxycorticosterone acetate and cortisone, (*c*) diabetes and nitrogen loss by cortisone, (*d*) nitrogen gain and somatic growth by testosterone, (*e*) masculinization and feminization (with depression of gonadal function) by androgens and estrogens respectively, and (*f*) atrophy of the adrenal cortex, contralateral to that involved by a neoplasm, by cortisone

It is unlikely that the endocrine effects induced by an adrenal cortical tumor are evoked by a single hormone or in many cases by a single class of endocrine compounds so that mixed clinical syndromes are encountered depending on the combinations of the various types of hormonal agents involved

ADRENAL CORTICAL TUMORS

Experimental Induction —Provided the hypophysis is present, the absence of gonadal hormones in certain species of animals results in hyperfunctioning cortical neoplasms The pituitary seems to be essential to any cortical hypertrophy [8] The brilliant discovery of Woolley and Little [9] elucidated a mechanism for inducing these tumors They employed the simple method of gonadectomy soon after birth in susceptible strains of mice, which resulted in the development of benign or malignant tumors, the incidence of tumors in the mice has been as high as 100%, and the tumors may involve one or both adrenal glands The tumors are preceded by hyperplasia of the cortex, they metastasize and are transplantable for many generations The neoplasms can produce androgenic or estrogenic hormones The tumors may be prevented by administration of estrogen [10] to the castrate mice, apparently as a result of pituitary inhibition Cortical adenomas also have been produced by the early castration of guinea pigs [11]

In humans with cortical tumors there is evidence of pituitary abnormalities Cushing [12] drew attention to the frequency of basophilic adenomas in the pituitary in certain states of human adrenal hyperfunction, however, it is now known that these adenomas are not prerequisite to the condition [13] Crooke [14] discovered that in the hyperadrenocorticism of Cushing's syndrome the pituitary basophils lose their granules and develop hyaline changes, these Crooke cells apparently are invariably present in adrenal tumors with corticoid effects [16]

Adrenal Tumors with Androgenic Effects —Virilism, or the adrenogenital syndrome, results from these benign or malignant tumors, which seem to occur exclusively in young persons Wilkins [16] collected from the literature 70 cases of adrenal tumors in childhood, 53 girls and 17 boys Thirty-one of the girls and 12 boys suffered from virilism Characteristic findings in virilism are an abnormally rapid rate of skeletal growth and dentition, strong and well-developed musculature, a deep voice, precocious development of pubic hair, and growth of the penis (clitoris) In adolescent girls amenorrhea develops

Chemical analysis of the urine has diagnostic significance in these cases Usually there is an increased excretion of 17-ketosteroids [17] The amount of androgens is often greatly increased, as indicated by comb-growth assay methods [18] The androgens dehydroisoandrosterone [19] and isoandrosterone [20] have been isolated from the urine in large amounts The estrogenic and gonadotrophic levels are not increased [18a]

Adrenal Tumors with Estrogenic Effects —Wilkins [16] found 12 cases of feminizing tumors in males in the literature up to 1948, all were between 26 and 44 yr, except 2 boys, aged 6 and 15 yr Most of the tumors are highly malignant neoplasms The most evident clinical findings are mammary hypertrophy and, in adults, gonadal atrophy with impotence A girl, aged 2 yr, had menstrual periods [21]

The urinary estrogens may be normal [16] or greatly increased in quantity The urinary estrogen in the case of Simpson and Joll [22] was estrone In a case studied by us there was a great increase of 17-ketosteroids in the urine, but the level of urinary estrogen was not abnormal (Fig 1)

Adrenal Tumors with Corticoid Effects —Albright [23] made the penetrating analysis ascribing the usual symptom complex in Cushing's syndrome to excessive production of corticoids (the "sugar hormone") that promote the conversion of protein into glucose (gluconeogenesis) and interfere with protein synthesis as an "anti-anabolic effect "

Adrenal tumors with Cushing's syndrome may be benign or malignant. They occur most commonly in young women [12], until 1939 only two occurrences had been reported in men [17a] There is characteristically a uniform clinical ensemble Fraser and others [17c] state "By Cushing's syndrome is meant a definite disease picture, the *most distinguishing* features of which are muscular weakness, atrophy of the skin, osteoporosis, hirsutism without other evidence of virilism, insulin-resistant diabetes, and amenorrhea or impotence " Striking features are the "moon" face, the "pig" eyes, the purplish cutaneous striae, and the "buffalo" type of obesity involving the head, neck, and trunk while sparing the extremities Polycythemia, leukopenia, and a decreased resistance to infection are common. Many patients have psychosis [24] Occasionally the syndrome is abnormal in that it is complicated by a strong androgenic component [25]

J Med. **8** 233 249 1939 (*b*) Wilkins [16] (*c*) Fraser R W Forbes A P Albright, F Sulkowitch H and Reifenstein, E. C. *Colorimetric Assay of* 17 Ketosteroids in Urine Survey of Use of This Test in Endocrine Investigation Diagnosis and Therapy J Clin Endocrinol **1**: 234-256 1941

In the urine markedly increased values of 17-ketosteroids are often encountered [26] and androgens likewise, as determined by growth of the combs of capons [18a] A great variety of classes of steroids has been isolated from the urine of a single patient [27] Appreciable quantities of 17-hydroxycorticosterone were isolated by Mason and Sprague,[28] which supports the postulate of Albright that corticoids are involved significantly in the pathogenesis of the disease Frank [29] discovered extremely large quantities of estrogen, unaccompanied by an increase of gonadotrophin, in the urine of four patients with Cushing's syndrome caused by cortical cancer

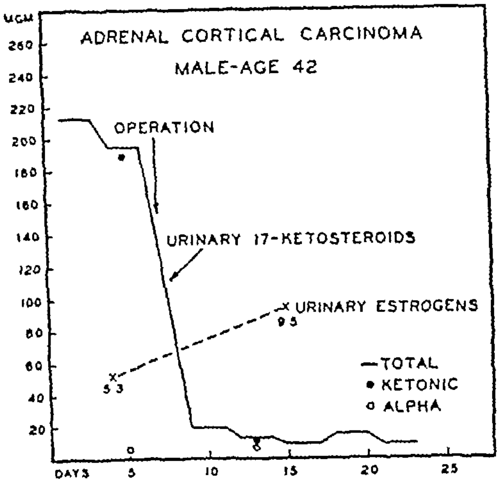

Fig 1—Daily excretion of 17 ketosteroids and estrogen in the urine of a male with a feminizing adrenal cortical carcinoma The assays were made by Dr William W Scott

The Cushing syndrome is not only produced by neoplasms but often results from bilateral adrenal hyperplasia There is no certain method for differentiating between these conditions unless a tumor can be palpated or visualized by radiography The presence of the characteristic symptom complex, in any event, is an indication for surgical exploration of the adrenals

The results of operation in Cushing's syndrome are usually excellent,[24a] as in the first case in which operation was successfully performed by Collett.[30] After successful surgical treatment the abnormal hair falls out within a few days, the hypertension rapidly recedes (Fig 2), and usually all symptoms and signs soon disappear

ADRENAL MEDULLARY TUMORS

Sympathetic Ganglion Tumors—These tumors are often malignant, especially in childhood,[31] and metastasize early They are frequently discovered only when a nontender abdominal mass is observed The treatment by surgery and irradiation is generally unsatisfactory

Pheochromocytoma—On analysis the l-norepinephrine content of these tumors has ranged from 0 95 mg to 6 96 mg per gram,[32] while the content of l-epinephrine varied from 0 03 to 6 5 mg per gram

The symptoms usually seen are those of either paroxysmal or persistent hypertension, the former syndrome being more frequently recognized The attacks may be frequent or widely spaced In a paroxysm the patient usually complains of precordial discomfort, palpitation, sweating, excitement, weakness, headache, labored breathing, and choking Often the patients are incapacitated The blood pressure is extremely high during the paroxysm

The diagnosis of pheochromocytoma, as with all disease, is dependent on the physician's awareness of the symptom complex, commonly there is an absence of symptoms and signs at the time of examination A tumor may be palpable, and sometimes during palpation of it an attack can be elicited Detection of hypertension during an attack is important for diagnosis The physician should be aware that chronic hypertension may be caused by a pheochromocytoma

Certain tests of diagnostic value have been described recently (*a*) The adrenergic-blocking agent piperoxan (2-[1-piperidylmethyl]1,4-benzodioxan) causes a considerable decrease in systolic and diastolic blood pressure after intravenous administration [33] (*b*) In certain cases in which a patient with pheochromocytoma is in a normotensive phase, the injection of 25 γ of histamine base results in a striking hypertensive response [34]

The first successful operation for pheochromocytoma was performed by C H Mayo,[35] and the first patient in whom the diagnosis was correctly made before exploration was operated upon by Shipley [36] After removal of these tumors the patient usually obtains immediate and permanent relief

SURGICAL TECHNIQUE

Denervation of the adrenals was extensively studied by Crile,[37] who reported improvement in patients with hyperthyroidism, peptic ulcer, diabetes mellitus, epilepsy, and other diseases, however, this procedure has been abandoned except as it is incident to thoracolumbar sympathectomy The only operations now carried out on the adrenal are the removal of tumors, partial resection of the gland, and complete removal of one or both adrenals

The technical problem in adrenal surgery is to secure adequate exposure, since these little glands are tucked high under the diaphragm All possible anatomic approaches seem to have been employed to circumvent that surgical obstacle—the bottom of the costal cage These incisions include the anterior abdominal incision, either longitudinal or transverse, the anterior subcostal [38], the lateral subcostal [39], the posterior vertical [40], the posterolateral,[41] and transthoracic [42]

We find that the posterolateral approach gives incomparably the best exposure The operation is done under spinal anesthesia The patient lies in the lateral position commonly employed in operations on the kidney, with the head and foot of the operating table lowered An incision 20 to 25 cm long is made in the loin over the 12th rib, which is resected, the fascia of Gerota is incised The upper pole of the kidney is the key to finding the adrenal The orange-yellow base of the adrenal is visualized, and the gland identified by palpation The right adrenal rides on the shoulder of the liver, while the left hugs the posterior peritoneum The adrenal glands are held in place by a number of fine strands of tissue, like guy wires, which are dissected under direct vision with scissors Usually none of these strands needs ligation except the principal adrenal vein, which is rather larger (about 4 mm in diameter) than the other suspending structures The vein is found on the anterior surface of the adrenal at the junction of the middle and lower thirds of the gland, where it may be readily identified by palpation, a hemostatic forceps is applied and the vessel is sectioned When hemostasis is secured by ligation and the gland has been excised, the wound is closed

In case of operation on both adrenals at the same sitting, we turn the patient on the opposite side, redrape him with sterile linen, and proceed as just described It is important in bilateral operations on the adrenals to administer fluids intravenously When the patient is obese, an incision is made over the internal saphenous vein at the ankle, and a cannula is inserted in this vein

MEDICAL MANAGEMENT INCIDENT TO ADRENAL SURGERY

In adrenal surgery we agree with Walters and Kepler [1] that "the most important factor in surgical therapy is the anticipation, prevention and control of postoperative adrenal cortical insufficiency " Remarkable advances have been made recently, so that the patient without adrenals can be supported in good health for long periods of time Until the last decade the mortality from extirpation of hyperfunctioning adrenal tumors was very high (30% as reported by Cecil [43] in 1933), especially in patients with Cushing's syndrome [15] and virilism [44] An atrophic adrenal usually exists contralateral to a cortical adrenal tumor In several cases [45] an adrenal gland could not be found at necropsy on the side opposite to that operated upon for cortical tumors

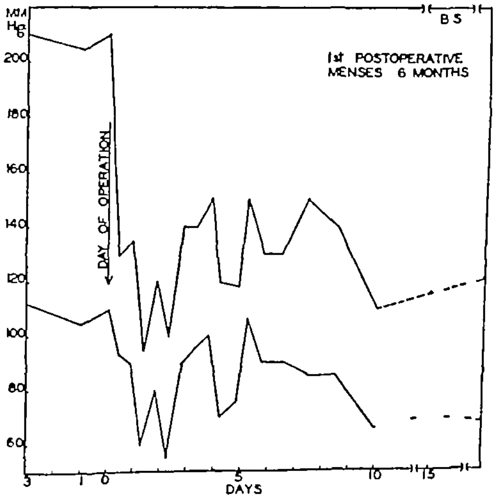

Fig 2.—Effect of removal of a benign adrenal tumor on the blood pressure of a woman with Cushing's syndrome

An improved understanding of the physiology of the human adrenal gland and the availability of steroid hormones, especially desoxycorticosterone acetate and cortisone, have revolutionized the management of patients after adrenal operations, where adrenal insufficiency is particularly dangerous to life From the practical standpoint insufficiency must be forestalled—it is rarely cured when it has developed immediately after operation It is a safe rule in any proposed extirpation of the adrenal to treat the patient in advance as if insufficiency were certain to develop postoperatively and to withdraw the essential medicines slowly, when possible, in the days after the operation

40 Young H. H A Technique for Simultaneous Exposure and Operation on the Adrenals Surg. Gynec & Obst **63** 179 188 1936 Crile [37]

The most critical test for postoperative therapy follows bilateral adrenalectomy, and a program of treatment has been devised so that this heroic ordeal may be endured with little danger By the use of this program bilateral adrenalectomy has been carried out consecutively in eight patients without fatality, and an addisonian crisis was not encountered The most important factors in prophylaxis of surgical adrenal insufficiency seem to be administration of adequate quantities of cortisone and desoxycorticosterone acetate (Table), replacement, by transfusion, of blood lost at operation, maintenance of systolic blood pressure, when levels below 100 mm of mercury are encountered, by slow intravenous injection of vasopressor substances, such as l-norepinephrine (10 γ of free base per 1 cc of 0 9% sodium chloride) We are of the opinion that the intravenous injection of massive amounts of fluid is harmful, the total amount of fluid injected during the first postoperative day should be small and perhaps should not exceed 1,500 cc Acetylsalicylic acid (0 6 gm by mouth) is given when the temperature is 38 C or higher We have not found it necessary to administer aqueous adrenal cortical extracts

Substitution Therapy for Total Adrenalectomy

0 Minus 1 Day		
Cortisone acetate *	50 mg	6 a m 12 noon 6 p m 12 midnight
Desoxycorticosterone acetate *	5 mg	6 a m
Sodium chloride *	5 gm	6 p m
0 Day (Day of Operation)		
Cortisone acetate	100 mg	7 a m
Desoxycorticosterone acetate	5 mg	7 a m
Operation †		8 a m
Cortisone acetate	50 mg	Every 4 hr
0 Plus 1 Day		
Cortisone acetate	50 mg	Every 6 hr
Desoxycorticosterone acetate	5 mg	1 injection
Sodium chloride	3 gm	by mouth
0 Plus 2 Days		
Cortisone acetate	50 mg	Every 12 hr
Desoxycorticosterone acetate	0-3 mg	As needed
Sodium chloride	3 gm	
Subsequent Days		

The dosage of steroids is gradually reduced until the sustaining dose of cortisone acetate (25 to 50 mg daily) is reached about one week after the operation desoxycorticosterone acetate is not required for maintenance therapy

* The cortisone acetate and desoxycorticosterone acetate were administered throughout by intramuscular injection and the sodium chloride by mouth

† Five hundred cubic centimeters of 0 9% sodium chloride and 500 cc of plasma are injected intravenously during operation and 10 γ of nor epinephrine per cubic centimeter is injected when systolic blood pressure falls below 100 mm

The maintenance dosage of cortisone acetate (37 5-50 mg per day by mouth) is usually instituted on the sixth postoperative day, it is not necessary to administer desoxycorticosterone acetate The patient supplements his diet by ingesting 2 to 4 gm of sodium chloride daily

REMOVAL OF NONNEOPLASTIC ADRENALS

Unilateral Adrenalectomy —The removal of one adrenal gland in the presence of its normally functioning mate in our experience and that of others [46] has not produced an appreciable functional or therapeutic effect We have performed this unilateral operation twice for essential hypertension and likewise for Cushing's syndrome without benefit to the patient Fontaine [47] has reported beneficial results following this procedure in five in a series of 11 patients with thromboangiitis

Bilateral Partial Adrenalectomy —Adrenal Hyperfunction After partial resection of both adrenals in two patients with virilism, Young [48] reported early improvement Recently, Priestley and co-workers [49] reported on their experiences with subtotal adrenalectomy in a series of 29 patients with Cushing's syndrome due to adrenal hyperplasia In 19 patients excellent remission from the disease was obtained

Hypertension There is considerable evidence implicating the adrenal glands in certain types of hypertension, for example, hypotension is a constant feature of Addison's disease, while certain adrenal tumors, both cortical and medullary, cause hypertension These and other considerations have led to attempts to modify chronic hypertension (not due to adrenal tumors) by adrenalectomy Neuhof [46a] observed a distinct reduction in blood pressure with relief of symptoms in 13 patients with very severe hypertension following bilateral partial adrenalectomy combined with sympathectomy Fontaine [47] employed the same procedures in 37 patients with persistent hypertension and stated that there were either good or excellent results in 20 patients Green and co-workers [50] removed about 97% of the adrenals of a woman with incapacitating hypertension and observed an arrest of the renal lesions with a striking regression of the cerebral, retinal, myocardial, and vascular disturbances Zintel and colleagues [46b] likewise have performed subtotal adrenalectomies in a series of patients with the severest grades of hypertension They concluded conservatively "In a limited follow-up period, it appears that subtotal adrenalectomy will produce some beneficial effects on the objective and subjective signs and symptoms as well as a variable reduction in the blood pressure of hypertensive patients "

Subtotal adrenalectomy at this time has pitfalls relating to the fragment of adrenal left Will the remnant survive at all, or will it hypertrophy and maintain the pristine disease? In the series of patients with Cushing's syndrome reported by Priestley and colleagues,[49] both difficulties were encountered In three of their patients

adrenal insufficiency developed, while in three others there was some recurrence of the Cushing syndrome

Bilateral Total Adrenalectomy — Hypertension Thorn, Harrison, and Criscitiello[51] reported on 12 patients with very severe hypertension with associated cardiovascular and renal disease Of these, eight patients have survived for a long enough period to evaluate the effect of the maintenance hormone therapy on the course of the disease Of these eight, four have shown great symptomatic relief with a significant reduction in blood pressure

Cancer The first successful total adrenalectomy in man was performed in this clinic[52] in 1945 for metastatic cancer of the prostate[53] in a man who was in a relapse after a remission induced by antiandrogenic control A retardation in the rate of growth of the neoplasm was observed in this patient, but adrenal insufficiency developed since cortisone and similarly active compounds were unavailable at that time Cox[54] performed subtotal adrenalectomy in a patient with paraplegia occurring from prostatic cancer, a brief remission resulted

With the availability of cortisone, the influence of the adrenals in men with widespread metastatic cancer of the prostate has been reinvestigated on an exploratory basis Recently two patients have been observed for very brief periods since operation, namely, for five and six months respectively Prior to bilateral adrenalectomy a remission occurred in both patients induced by the standard antiandrogenic measures of orchiectomy and the administration of estrogen Subsequently, each had suffered a relapse characterized by a general decline in weight and strength accompanied by great pain, which required sedatives many times daily, one patient was bedridden After adrenalectomy with maintenance cortisone therapy, a clinical remission occurred in each patient characterized by immediate and persistent loss of pain and a gain of more than 25 lb (11 3 kg) in weight Both of these patients have returned to work Despite the impressive nature of the clinical remissions, it should be emphasized that the number of cases is very small and the duration of observation since operation is exceedingly short.

SUMMARY

The removal of excessively functioning tumors of the adrenals leads to gratifying results The extirpation of nonmalignant adrenal glands is still in an exploratory phase Patient's with Cushing's disease due to adrenal hyperplasia and hypertension of certain types have been benefited Although the period of postoperative observation has been exceedingly brief, in two patients with very advanced cancer of the prostate a clinical remission of the disease occurred after adrenalectomy with maintenance cortisone therapy

It is true that, through science, it is now possible to anticipate or to overcome human adrenal insufficiency effectively by simple and relatively inexpensive methods However, very extensive or complete removal of adrenal tissue may lead to Addison's disease Before adrenalectomy is carried out, the physician is faced with a grave decision Do the chances of the therapeutic rewards counterbalance the certainty of long continued hormonal-replacement therapy and the constant danger of the development of Addison's disease? Adrenal surgery must never be embarked upon lightly

RESULTS OF PROPYLTHIOURACIL THERAPY FOR HYPERTHYROIDISM

E Perry McCullagh, M D , D C Humphrey, M D , Cleveland, C J McGarvey, M D , Des Moines, Ia
and
V Sundgren, M D , Tulsa, Okla

This article is based on a study of patients treated for hyperthyroidism with propylthiouracil and is concerned chiefly with the ability of such treatment to produce remissions It also deals with certain advantages and disadvantages related to the over-all clinical handling of the disease by this method The final decision as to the permanency of remissions would imply following each patient throughout his life The patients discussed here have almost all been followed for 24 months or less

The patients studied started treatment between January, 1946, and April, 1947 A total of 179 such hyperthyroid patients were followed During the same interval of time, 71 additional patients were treated with propylthiouracil, but they could not be included in this survey for various reasons, they were patients who were undergoing trial therapy of arterial hypertension, patients with angina pectoris or congestive failure without hyperthyroidism, and patients who were observed only once and whose treatment was subsequently managed by the referring physician elsewhere

DOSE

Propylthiouracil was used in the beginning in doses now considered inadequate in most instances The dose varied considerably, but in almost all patients it eventually exceeded 200 mg and later 300 mg a day Two patients failed to respond to 400 mg per day

Early in our experience with propylthiouracil in the treatment of toxic diffuse goiter (Graves's disease) it was found that the vascularity of the thyroid commonly increased during therapy and that the accompanying thrill

---

From Cleveland Clinic Hospital and the Frank E. Bunt Educational Institute

and bruit could be quickly eliminated by administration of 10 to 20 mg of iodine a day More recently iodine has been used concurrently throughout the entire period of propylthiouracil treatment

In some patients the basal metabolic rate tends to fall to abnormally low levels and clinical signs of hypothyroidism appear This should be avoided, since on theoretical and experimental grounds such a state would stimulate the production of pituitary thyrotropic hormone and thus stimulate the further enlargement of the existing goiter in clinical hyperthyroidism Such a state might increase the possibility of recrudescence of the hyperthyroidism after withdrawal of the antithyroid drug, although this has not been proved

In some patients the dose of antithyroid drug which gives complete control of hyperthyroidism and that which does not control differ by only a narrow margin If hypometabolism occurs, an increase in thyrotropic hormone production would be expected If the dose of antithyroid drug is decreased drastically early in treatment, recurrence of the hyperthyroidism would be likely To those patients whose basal metabolic rate falls below zero on relatively small amounts of propylthiouracil we have considered it prudent to give desiccated thyroid concurrently in sufficient doses to maintain a relatively euthyroid state without relaxing control of the overactivity of the gland For similar theoretical reasons it may prove good practice in the future to continue thyroid feeding for some time after propylthiouracil is withdrawn

Among the 179 patients treated for hyperthyroidism and adequately followed, there were two groups of 38 patients who could not be included in a survey calculated to establish the success or failure of this treatment as a curative measure In the first group (27 patients) the drug was used to control hyperthyroidism in preparation for surgery alone This use of propylthiouracil is eminently successful In the second group the curative effect of the treatment cannot be estimated because administration of the drug was never discontinued The chief reason for this was that these patients were considered unsuitable for surgery even though the hyperthyroidism was well controlled (Table 1) The drug was well tolerated, its use entailed little inconvenience, and, since we hesitated to risk exacerbation, administration of the medication was not stopped For three of these patients the drug was prescribed repeatedly elsewhere Treatment may be considered successful in this group from the standpoint of control of the hyperthyroidism

Although it was not the original intention to continue antithyroid medication indefinitely, long-continued administration of the drug in these cases demonstrates that it may be used in this way if circumstances warrant. Our present practice is to discontinue therapy after hypermetabolism has been completely controlled for about one year In the event of recurrence, radioactive iodine or surgery is prescribed

In 141 patients who have been followed, therapy was planned with the idea of producing a permanent remission after withdrawal of treatment In the majority of those who had Graves's disease, 10 to 20 mg of iodine was given daily, usually calcium iodostearate (stearodine*), 1 or 2 tablets a day, concurrently from the beginning of treatment It had previously been demonstrated that iodine in this dosage neither accelerates nor retards the effect of propylthiouracil in Graves's disease in any degree clinically important Whether or not it may have a bearing on the final remission rate following withdrawal of treatment is not known In Table 2 data are presented to show the results actually obtained

Among the patients in whom we failed to produce a remission are 18 in whom satisfactory control was never achieved for one reason or another, as indicated These 18 patients are included among those showing failure of control or relapse in most of the data which follow The reader should realize that these failures are, for the most part, not to be considered failures of the drug If we are willing to accept as a fact that at least 11 of these patients actually did have inadequate doses, then the figures could be handled in a different way In the future it might be assumed that approximately half of these patients would be in the remission group, thus changing the figures for all cases treated to 75 in remission and 66 as relapse or failure to control

TABLE 1 —*Associated Conditions Contraindicating Surgery in Hyperthyroidism*

Reason	Number of Cases
Congestive cardiac decompensation plus auricular fibrillation	2
Cardiac decompensation (rheumatic)	1
Angina pectoris	1
Postoperative tetany	1
Senility	1
Dwarfism and diabetes mellitus	1
Drug prescribed elsewhere	3
Condition not stated by patient or referring physician	1
Total	11

REMISSION

Remission, as we have referred to it in this paper, implies complete freedom from symptoms and signs of hyperthyroidism, and a basal metabolic rate of less than + 10% A patient was not considered as having experienced remission if symptoms persisted, especially if the basal metabolic rate was rising, even though it was not as high as + 10% In deciding which patients should be considered in remission, duration of administration of the drug was irrelevant, provided that complete control of the hyperthyroidism was obtained for even a short period of time It is quite possible that more prolonged use might have influenced results, even though a second or third trial of the drug had been made and might have

TABLE 2 —*Unsatisfactory Results of Concurrent Use of Iodine With Propylthiouracil in Graves's Disease*

Cause	Number of Patients	Dose Mg / Day	Comment
Failure of drug	2	400	Would higher dose levels have been effective?
Inadequate dose	2	50-75	One recurred after subsequent thyroidectomy
	5	200	
	4	300

Enlargement of the gland in 2			

been followed by remissions of three or more months' duration Relapses are recorded as such if one relapse occurred, whether or not good control was obtained later Relapse signifies a rise in basal metabolic rate to + 10% or above, with recurrence of symptoms of hyperthyroidism after the drug has been discontinued

Of the group of 141 patients in whom an attempt was made to induce permanent remission, regardless of the type of goiter (diffuse, nodular, or recurrent), there were 70 patients in remission and 71 in whom there was incomplete control, or relapse

TABLE 3 —*Response to Propylthiouracil Therapy in Relation to Sex*

	Female		Male		
	No	%	No	%	Total
Remission	46	44 7	24	63 2	70
Relapse or failure to control	57	55 3	14	36 8	71
Total	103		38		141

TABLE 4 —*Proportion of Nodular and Diffuse Goiters in Men and Women in 141 Patients*

	Female	Male
Nodular	41%	16 6%
Diffuse (Graves's disease)	59%	83 4%

In an attempt to obtain more authentic criteria in the selection of patients for propylthiouracil therapy, the patients were examined with regard to the separate factors described below

Sex —The therapeutic responses relative to sex are shown in Table 3

According to the figures in Table 3, remission rate is greater among men than among women More complete study of the data, however, indicates that sex is not the only factor of importance in producing this apparent effect It may be associated with the fact that nodular goiter is more prevalent in women, and such nodular goiters are less responsive to antithyroid drugs than are the diffuse goiters of Graves's disease The proportion of nodular and diffuse goiters in men and women in this group is shown in Table 4

TABLE 5 —*Age Distribution of Relapses and Remissions in 135 Cases of Hyperthyroidism**

Decade	Relapse and Failure to Control No of Cases	Remission Six Months or More	Remission Less Than Six Months
1	0	1	0
2	2	0	0
3	8	5	0
4	14	21	2
5	14	14	1
6	19	13	1
7	10	5	3
8	2	0	0

* The data were incomplete in six cases thus only 135 are described in this table

Age —The distribution of relapses or failures and remissions in relation to age is shown in Table 5

It is interesting to note from Table 5 that the failures are proportionately more common in patients over 50 years of age It is important to call attention to the fact that seven of the patients over 50 who failed to show remission on propylthiouracil medication had previous postoperative recurrences Only two such patients in this age group obtained remission Another factor influencing the relapse rate is the prevalence in the older age group of nodular goiter, which responds less favorably than diffuse goiter In short, age in itself does not appear to be a barrier to a good response to propylthiouracil

Initial Basal Metabolic Rate —Results of the separation of patients into two groups having basal metabolic rates of more or less than + 40% are shown in Table 6

If the patients are considered in two groups, one in which the metabolic rates were + 30% or less and one in which they were + 50% or more, the results are shown in Table 7

Thus our experience indicates that a patient with a high basal metabolic rate before treatment has a chance of permanent remission almost equally as good as that of a patient with mild hyperthyroidism

Duration of Control Maintained by Treatment —An attempt has been made to determine whether or not the long-continued control of hyperthyroidism under treatment materially influences the proportion of patients remaining in lasting remission after cessation of therapy

TABLE 6 —*Results in Patients With Basal Metabolic Rates of More or Less Than Plus 40 Per Cent*

Basal Metabolic Rate	Relapse or Failure to Control	Remissions
40% +	27	24
Less than 40%	37	35

TABLE 7 —*Results in Patients With Basal Metabolic Rates of Plus 30 Per Cent or Less and Plus 50 Per Cent or More*

Basal Metabolic Rate	Relapse or Failure to Control	Remissions
+ 50% and above	14	13
+ 30% and below	22	27

Our figures do not show that a maintained remission for 12 mo or more increases the length of post-treatment remission If the patients not completely controlled are excluded, we find that in the group controlled under therapy for less than 12 mo , remissions were 62%, and failures 38%, in those controlled for 12 mo or more remissions occurred in 61% and failures in 39%

Rate of Response —An early impression in this work indicated that patients who responded rapidly to treatment had a better chance to stay in lasting remission than those who responded slowly Further experience and careful consideration of the facts at hand have not sustained this theory For example, there were 12 patients in whom hyperthyroidism was not completely controlled until after four months of treatment, and who had recurrences within six months after cessation There were eight others who came under control equally as slowly, who remained in remission longer than six months after treatment was discontinued

Size of Goiter —The size of the goiter appears to bear some relation to the possible remission following treatment Of 71 relapses the approximate size of the gland was known in 56 patients Among these there were 44 glands of small and medium size Of 70 remissions there were 65 small and medium-sized glands This appears more significant in consideration of the fact that postoperative recurrences are represented mostly by small or medium-sized glands and in such recurrences propylthiouracil therapy is relatively unsuccessful

Type of Goiter—The type of goiter seems to have a distinct bearing on the result of therapy as outlined in Table 8

TABLE 8—*Relation of Type of Goiter to Propylthiouracil Therapy*

	Remission	Relapse or Failure to Control	Total
Diffuse (previously untreated)	47 (62%)	29 (38%)	76
Postoperative recurrent	8	18	26
Total diffuse glands	55	47	102
Nodular	12 (34%)	23 (66%)	35
Total	67*	70	137

* Note that the apparent discrepancy in the numbers 67 and 70 (70 and 71 elsewhere) is due to the fact that our data do not classify the type of goiter present in all patients

Period of Remission—The period of remission produced by propylthiouracil treatment is of prime interest in this problem Of our group of 141 patients treated definitively with propylthiouracil, 70 are known to be in remission The final duration of these remissions cannot be estimated accurately However, their present duration is shown in Table 9

TABLE 9—*Existing Remissions*

Known Duration	Number of Patients
Less than 6 mo	8
6-12 mo	31
13-24 mo	25
25 or more mo	6
	70

It is instructive to compare the figures in Table 9 with those representing the span of time in remission in patients in whom relapses were known to occur and in whom the time of relapse was known, as shown in Table 10

TABLE 10—*Duration of Remission in Patients Having Relapse*

Months in Remission	Number of Patients
1	12
2	7
3	6
4	3
5	0
6-11	5
12 and over	3
	36

The fact that the majority of such relapses occurred before the fifth month adds significance to the number of remissions lasting more than six months and especially to those in remission 12 mo or longer

In summarizing, the best results have been obtained in Graves's disease, excluding postoperative recurrences Failures are most frequent in patients with nodular goiter and in those with postoperative recurrences In the latter group almost all show diffuse glands of Graves's disease, a fact which is acknowledged, but the difference in results between this group and the previously untreated cases of diffuse goiter has appeared so striking that we have placed them in a separate category in relation to this type of treatment

RESPONSE OF IDEAL CANDIDATES TO PROPYLTHIOURACIL TREATMENT

In view of the previously mentioned findings it is interesting to determine the remission rate in a group of patients who were selected in retrospect as most likely to obtain permanent cure These results, we believe, indicate the probable prospects with such therapy in patients selected in a similar manner

The criteria for acceptance into this group were (1) the diagnosis of Graves's disease and (2) a small to moderate-sized goiter Those few patients with Graves's disease and large goiters, those with postoperative recurrences, and those with nodular goiters were excluded In addition, we might have accepted only persons in whom hyperthyroidism had been controlled for two months or longer However, since we have been unable to make a concise correlation between relapse rate and the duration of control, this time factor is not considered here There were 60 patients in this group Fourteen (23 3%) experienced relapses, and 46 (76 6%) are in remission

It is important to compare the rate of recurrence of hyperthyroidism after propylthiouracil therapy with recurrences following other types of treatment In Graves's disease the recurrence rate after thyroidectomy varies from 5%[1] to 18%[2] The latter figure is comparable with the average for the United States as a whole In addition, we have learned that recurrences of activity in Graves's disease are not unknown after control with radioactive iodine As of June, 1950, we had encountered four such patients known definitely to have had a relapse and two in whom relapse was strongly suspected On the latter two we have no data which proves complete control, although the patients were symptom free and had attained a normal weight before exacerbation was observed This represents a rate of recurrence in patients treated with I^{131} approximating 2%

The outstanding advantage of a cure following the use of an antithyroid drug lies in the fact that the thyroid remains intact and there is complete freedom from the risk of such complications as recurrent nerve injury, parathyroid tetany, and lasting hypothyroidism In short, a cure produced in this manner is the most physiological cure available

SUMMARY

Of 179 patients with hyperthyroidism followed after treatment with propylthiouracil, an attempt was made to produce a permanent remission in 141

In this group, regardless of type of goiter, adequacy of therapy or other influencing factors, 50% of the patients have remained in remission Existing remission has lasted for from two months to over two years Sixty-two of the 70 remissions have continued for more than six months Most relapses which occur are seen earlier than five months In patients in whom the time of relapse was accurately known, relapse occurred within four months in 28 of 36 cases

[2] Thompson W O Taylor S G., and Meyer K A Factors Influencing Operative Mortality in Exophthalmic Goiter Ann Int. Med 8 350 (Sept.) 1934

Age, sex, or severity of hyperthyroidism do not appear to be essential factors in influencing the chances of lasting remission The rate of response to a given dose of the drug and the duration of maintenance of control under therapy are not necessarily matters of importance in producing lasting remission The type of goiter, however, is important

Remission rate in Graves's disease in this series was 61 8%, and in nodular goiter only 34 2%

Patients who have had one or more relapses following surgery are unlikely to attain a permanent cure after withdrawal of propylthiouracil

In patients selected because of the presence of Graves's disease, small to moderate-sized goiters, and in whom complete control of hyperthyroidism had been maintained for more than two months, remissions were present in 76 6%

Important advantages of a lasting remission after propylthiouracil or methylthiouracil therapy are the presence of an intact thyroid gland and freedom from lasting complications such as hypothroidism, tetany or laryngeal paralysis

Propylthiouracil is distinctly beneficial, not only in preoperative preparation, but also in prolonged therapy for patients in whom surgical risk remains high, especially if radioactive iodine is not available

This drug is also valuable as definitive treatment in selected cases of hyperthyroidism, especially in Graves's disease

COMPARISON OF AUREOMYCIN AND CHLORAMPHENICOL IN TREATMENT OF BACTERIAL PNEUMONIA

William M M Kirby, M D , Jean C Michel, M D , Daniel H Coleman, M D , James W Haviland, M D
and
Donal R Sparkman, M D , Seattle

Pneumococcic pneumonia has been found to respond to aureomycin therapy in a manner comparable to that observed with penicillin A rapid defervescence was noted in 31 of 33 patients treated by Gocke, Collins, and Finland,[1] and there were only two deaths, both occurring within 18 hr after starting therapy Dowling and others [2] reported a case fatality rate of 1 5% among 131 cases of pneumococcic pneumonia treated with aureomycin, as compared with a rate of 5 2% in 686 cases treated with penicillin

Much less is known concerning the effectiveness of chloramphenicol in the treatment of pneumococcic pneumonia This antibiotic has been reported by Bliss and Todd [3] to have little effect on the course of pneumococcic infections in mice In man, however, clinical studies in a small number of patients have yielded encouraging results [4]

The following study, carried out during the first six months of 1950, was undertaken to explore further the potentialities of these two antibiotics in the treatment of bacterial pneumonias occurring in adults A comparison was made between the results obtained with aureomycin and chloramphenicol In addition, the effectiveness of doses smaller than those usually employed was evaluated

METHOD OF STUDY AND CLINICAL MATERIAL

From Jan 1 to June 15, 1950, all adult patients admitted to the Infectious Disease Service of the King County Hospital with a diagnosis of pneumonia were treated with aureomycin or chloramphenicol [5] One hundred and twenty-one patients were so treated Of this total, 21 cases were discarded when review of the protocols revealed that they did not meet criteria for the diagnosis of early, untreated bacterial pneumonia, leaving a balance of 100 acceptable cases on which this report is based Diagnosis of the 21 unacceptable cases were as follows virus pneumonia, three, acute febrile infection, not pneumonia, six, intrathoracic neoplasm, three tuberculosis, two, cardiac failure with pulmonary infarction, two, bronchiectasis without definite pneumonia, one, pneumococcic pneumonia admitted following the crisis, one, extensive treatment prior to admission, two, and bleeding peptic ulcer with bronchopneumonia, one Of these 21 cases, four patients died, and all had postmortem examinations Causes of death in these four as determined at autopsy were hematogenous tuberculosis, rheumatic heart disease with pulmonary infarction, bleeding peptic ulcer with bronchopneumonia, and carcinoma of the trachea with metastases

Besides the routine laboratory studies, chest x-rays were taken, blood was drawn for culture, and a fresh sputum specimen was obtained prior to institution of therapy The sputum was examined by direct smear (Gram's stain), streaked on a blood agar plate, and a direct typing was attempted Sputum was also inoculated into mice, and typing was performed the following day from peritoneal washings [6] Organisms which could not be

typed, but which had appropriate morphological and cultural characteristics and were bile soluble, were considered to be pneumococci of higher types Acute and convalescent serums were obtained from most of the patients in whom the diagnosis of pneumococcic pneumonia was not definitely established, and were tested for cold agglutinins, Streptococcus MG agglutinins, and complement-fixing antibodies for psittacosis and Q fever[7] All pneumococci were tested for sensitivity to choramphenicol and aureomycin, using a tube dilution method Aureomycin serum levels were estimated in a number of patients, using the method of Dornbush and Pelcak.[8] A similar method was found to be satisfactory for determining chloramphenicol serum levels

The plan of treatment was to give aureomycin and chloramphenicol to alternate patients, administering 1 gm daily in a single dose For most of the study this policy was adhered to, but a number of exceptions occurred In spite of the failure to follow rigidly the proposed schedule, the two groups were quite similar in most respects, as indicated in Table 1 A close similarity was found in the temperature, white blood cell count, and severity of illness at the time of admission Patients treated with chloramphenicol fell into a somewhat older age group Preexisting disease was present in approximately half of the patients, and was well divided between the two groups The pneumonia was of five days' duration, on the average, when therapy was instituted

A diagnosis of pneumococcic pneumonia was made in 76 of the 100 patients, and blood cultures were positive for pneumococci in 15 (20%) Types of pneumococci isolated from the sputum or blood in these cases are listed in Table 2, and susceptibilities of most of them to aureomycin and chloramphenicol are listed in Table 3 Of the 24 patients from whom pneumococci were not isolated, two had pneumonia caused by Friedlander's bacillus, two by Escherichia coli, and one by Hemophilus influenzae In the remaining 19 a diagnosis of bacterial pneumonia, etiology undetermined, was made These 19 patients had clinical findings compatible with pneumococcic pneumonia, but were not given this definitive diagnosis since pneumococci, or other predominating organisms, were not isolated from the sputum None had an initial elevation or comparative rise in titer of cold agglutinins, or of the other antibodies tested

Patients Treated with Aureomycin —Good Response Thirty-seven of the 50 patients treated with aureomycin had a good clinical response, with no complications

---

[7] These tests were performed at the Virus Diagnostic Laboratory of the University of Washington School of Medicine and the Washington State Department of Health

[8] Dornbush A C., and Pelcak, E. J The Determination of Aureomycin in Serum and Other Body Fluids, Ann New York Acad Sc 51 218 1948

(Table 5) Twenty-eight of these successfully treated cases had pneumococcic pneumonia, 19 were considered seriously ill, and two had positive blood cultures The other nine patients had bacterial pneumonias in which pneumococci were not isolated Thirty-one of the 37 patients received 1 gm of aureomycin on admission, and 1 gm once a day for an average of six days Of the remaining six patients, two were given 2 gm daily in divided doses One of these patients was a 350-lb woman who was severely ill, the other was a man with mitral stenosis and congestive failure, who was also seriously ill Since it was not known that 1 gm daily was the optimal dose, it was considered safer to administer larger amounts in these two cases Four patients, who were disoriented, uncooperative, and had difficulty in ingesting oral medications, were given aureomycin intravenously as well as by mouth Of the 37 patients in this group, only two had received any treatment prior to admission Each had been given 300,000 units of penicillin procaine the day before entry, but both were still acutely ill, with high fever, and pneumococci were isolated from the sputum The course of a typical patient in this group is shown in Figure 1

Complications In eight patients who were treated with aureomycin the hospital course was complicated As outlined in Table 6, one patient with pneumococcic pneumonia had a sterile effusion, while in another pneumococcic empyema (type 2) developed, which responded to intrapleural penicillin One man had pneumococcic *meningitis*, as well as pneumonia Following three days of intensive intravenous and oral aureomycin therapy, there was some improvement in the spinal fluid findings, but pneumococci were still present on culture Since his condition remained critical, aureomycin was discontinued and intensive penicillin therapy was begun, the meningitis was cured, but some mental impairment remained Three patients had delayed resolution of their pneumonias with a slow temperature response, the explanation in two of these cases was not clear, while in the third, cardiac decompensation may have played a role In one patient a partial collapse of the middle lobe occurred during therapy, and the temperature remained elevated for 11 days Bronchograms and bronchoscopy later demonstrated no satisfactory explanation for the collapse In the final case the pneumonia responded satisfactorily but the temperature *remained elevated* for 10 days owing to a severe thrombophlebitis

Deaths Five deaths occurred *among the 50 patients* treated with aureomycin, four were examined postmortem One, a chronic alcoholic aged 47, entered the hospital unconscious, with signs of a cerebrovascular accident and bilateral lower lobe pneumonia with bacteremia (type 12) He was given intensive intravenous aureomycin therapy, but he died two days after admission Autopsy revealed massive cerebral thrombosis which probably was the cause of death A man aged 67 with involvement of the left upper and lower lobes with bacteremia (type 3) entered the hospital desperately ill and went into circulatory collapse, with a subnormal temperature, shortly thereafter Despite intensive oral and intravenous administration of aureomycin, he died 38 hr after admission It seems probable that this patient died of an overwhelming infection in spite of therapy Three fatalities occurred in the patients with bacterial pneumonias of undetermined etiology One was a chronic alcoholic aged 63, who entered the hospital with a right lower lobe pneumonia On aureomycin, 1 gm daily, his temperature gradually decreased, but never reached normal levels A loculated effusion devel-

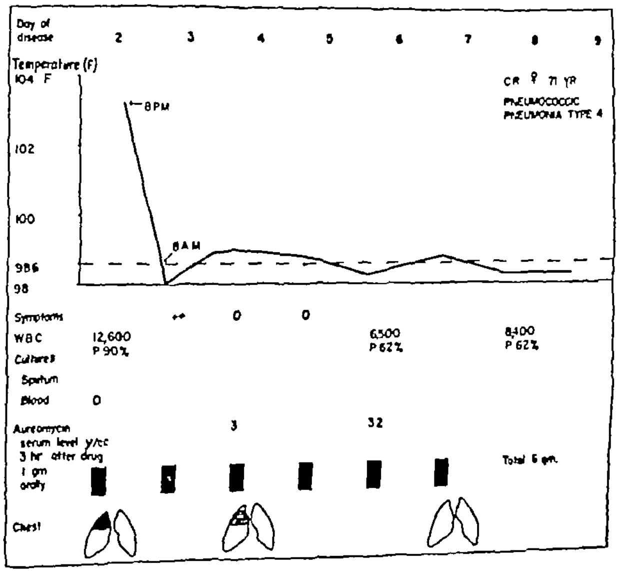

Fig 1—Clinical course of a representative patient treated with aureomycin

oped in the right chest, and 220 cc of slightly cloudy, sterile fluid was removed five days after admission. Dyspnea developed, and the heart, previously normal in size, was found to be markedly enlarged one week after entry. The congestive failure did not respond to the usual measures, and he died 16 days after admission. On autopsy there were minimal residual signs of pneumonia of the right lower lobe, with a thin layer of loculated, gelatinous pleural exudate. There was fatty infiltration of the liver, and hypertrophy and dilatation of the heart, of undetermined cause. This was a complicated case in which the pneumonia apparently responded to aureomycin, but in which heart failure appeared and was the cause of death. Another patient, a man aged 40 with multiple sclerosis who was unable to cough effectively, or raise sputum, was admitted with aspiration pneumonia. He was critically ill on admission, and a pure growth of Esch coli was cultured from tracheal aspirations. In spite of the daily administration of 300 to 500 mg of aureomycin intravenously, he rapidly grew worse and died after six days in the hospital. Post-mortem examination revealed an extensive bilateral bronchopneumonia. The role of aureomycin is difficult to evaluate in this patient as he had partial respiratory paralysis and aspiration of gastric contents. The fifth patient, a 74-year-old man with a right lower lobe pneumonia and Staphylococcus aureus and pneumococci in the sputum, had received penicillin in four days without improvement. His sputum then contained a pure culture of Esch coli. With aureomycin, 1 gm daily for six days, his temperature fell to normal, and on x-ray examination there was partial clearing of the infiltrations. Clinically, however, he became progressively weaker. X-ray density persisted in the right chest posteriorly, but no fluid was obtained when thoracentesis was attempted. He died six weeks after aureomycin was discontinued, and at autopsy was found to have an empyema on the right, with atelectasis and multiple abscesses of the right upper lobe. Unfortunately, cultures of the pus were not obtained.

Patients Treated with Chloramphenicol—Good Response. Forty of the 50 patients treated with chlorampheicol had a good response to therapy (Table 5). Of these, 31 had pneumococcic pneumonia, 20 were considered severely ill, and positive blood cultures were obtained in four. Nine patients had nonpneumococcic bacterial pneumonias, two of these were caused by Friedlander's bacillus, one by Hemophilus influenzae, and in six the etiologic organism was not isolated. The antibiotic was administered in the same dosage as aureomycin, i e, an initial dose of 1 gm followed by 1 gm daily for an average of six days. In this group only one patient had received therapy previously, he was given an unknown amount of oral penicillin the day before admission. The chart of a typical patient in this group is shown in Figure 2.

The three patients whose pneumonias were caused by gram-negative bacilli deserve special attention. Two of these had Friedlander's pneumonia. One responded to 1 gm of chloramphenicol daily with rapid improvement over a period of three days, and was entirely well, with a clear x-ray, within two weeks. The other patient, who was much sicker and had a positive blood culture, received 4 to 6 gm of chloramphenicol daily, the course of his disease was long and complicated by pulmonary abscess formation but eventually satisfactory. The third patient, despite the daily administration of 400,000 units of penicillin for three days, remained desperately ill. At that time he was found to have a shift from a mixed sputum flora to a nearly pure culture of Hemophilus influenzae, and a blood culture was positive for the same organism. He was transferred to the Infectious Disease Service, where chloramphenicol was given in amounts of 1 gm daily. There was a prompt response with a temperature fall and improvement from the signs of pneumonia within three days.

Complications. In eight patients treated with chloramphenicol complications developed (Table 6). These were all in proven pneumococcic pneumonias. One had a good response to a five-day course of treatment, but relapsed four days later, and with retreatment made an uneventful recovery. Small sterile effusions developed in three cases, but were not associated with a febrile reaction. Of the two patients with delayed resolution, one had bronchiectasis and the other had silicosis. Another patient developed a collapse of the right lower lobe during therapy. A 59-year-old man with a severe type-7 pneumonia and bacteremia received 1 gm of chloramphenicol on admission and a similar amount 12 hr later, but developed signs of pneumococcic meningitis 18 hr after entry. With massive intramuscular penicillin therapy he made a prompt recovery.

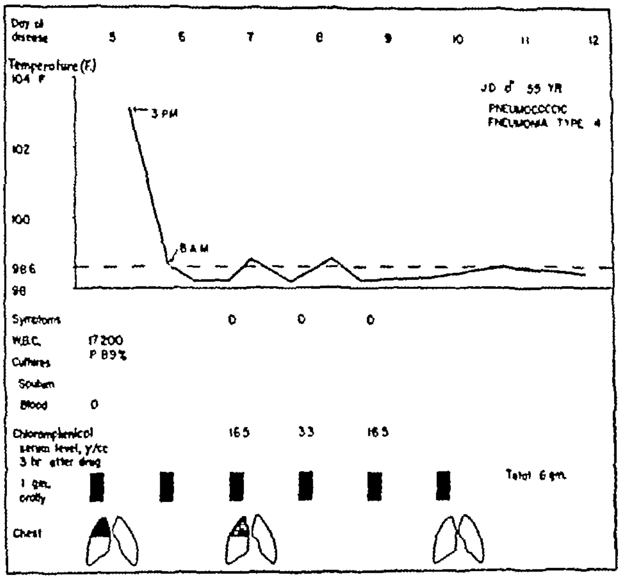

Fig 2—Clinical course of a representative patient treated with chloramphenicol

Deaths. Two fatalities were encountered in this group. One, a man aged 76 chronically ill with multiple myeloma, entered the hospital with signs and symptoms of pneumonia of both lower lobes. He was given 1 gm of chloramphenicol every 12 hr, with a fall in temperature to normal in four days, accompanied by a marked improvement in the clinical picture. However, despite a normal temperature and clearing on the x-ray, he became progressively weaker and died of the multiple myeloma on his 10th hospital day. The other fatality occurred in a man aged 74 with a type-18 pneumonia and bacteremia, following a history of four to five months' anorexia and weight loss with pain in the mid-back His condition was critical on admission He was given chloramphenicol resulting in a marked fall in temperature in the first two days He remained disoriented and incontinent, however, and when the temperature rose again two days later, he was given aureomycin intravenously He failed rapidly and died four days later Two cubic centimeters of pus were removed from his right lower chest the day before his death and Friedlander's bacilli were recovered on culture This man was more debilitated than could be explained on the basis of pneumonia, and in view of the long history may well have had some underlying disease, however, an autopsy was not obtained, and pneumonia must be regarded as the cause of death

COMMENTS

In the present study, favorable results have been obtained with both aureomycin and chloramphenicol in the treatment of bacterial pneumonias in adults The prompt response noted with aureomycin is similar to that previously described in the treatment of pneumococcic pneumonias with this antibiotic by Gocke and others,[1] and Dowling and associates[2] The results obtained with chloramphenicol are of special interest, since little information is available so far concerning its effectiveness in the treatment of bacterial pneumonias

Toxic manifestations were not observed with chloramphenicol With aureomycin, nausea, vomiting, and diarrhea which could be attributed to ingestion of the antibiotic occurred in only a few patients, and in no instance required a change to another antibiotic This low incidence of toxicity is probably due to the small doses administered Ten patients who were uncooperative or disoriented, or who were unable to take medications by mouth, were given aureomycin intravenously The intravenous preparation, which was given in doses of 100 mg every 8, 12, or 24 hr, was well tolerated and, when diluted in 100 cc or more of 5% dextrose or isotonic saline solution, caused no local reactions An intravenous preparation of chloramphenicol was not available at the time of this study

From a comparative standpoint, superiority can be claimed for neither antibiotic on the basis of the present series Although it was not possible to rigidly alternate the patients, the two groups treated were similar in most respects, and any clear-cut differences in therapeutic efficacy should have become evident. It is of interest that, as indicated in Table 2, pneumococci isolated from the patients treated were somewhat more susceptible in vitro to aureomycin than to chloramphenicol The explanation for the fact that the clinical response to chloramphenicol was equally as good as that to aureomycin may lie in the differences observed in blood serum concentrations following the administration of equivalent doses of the two antibiotics With aureomycin, serum levels four hours after the ingestion of 1 gm fell in the general range of 2 to 6 γ per cubic centimeter while with chloramphenicol levels of 15 to 25 γ per cubic centimeter were commonly observed

Optimal dosages of aureomycin and chloramphenicol have not yet been determined for most infections One condition that might be expected to respond to doses smaller than those usually employed is pneumococcic pneumonia, since pneumococci are highly susceptible to both antibiotics in vitro Accordingly, the majority of the patients in the present series received only 1 gm daily, which was given in a single dose because of the prolonged blood levels obtained with these antibiotics after oral administration Random blood samples, collected from 20 patients 24 hr following the oral administration of 1 gm, were found to contain aureomycin in every instance, in concentrations ranging from 0 025 to 0 8 γ per cubic centimeter

The results obtained on this regimen of 1 gm daily would appear to justify the conclusion that this dosage is adequate for the treatment of many, but possibly not all, patients with pneumococcic and other bacterial pneumonias Of the 81 patients treated with 1 gm daily, 57 were considered severely ill and six were bacteremic The response in this group was uniformly good Of the 19 patients who received more than 1 gm daily, 16 were considered severely ill, nine were bacteremic, seven were among the 16 patients who ran a complicated course, and four were among the seven patients who died In general, the patients who were given more than 1 gm daily were those who did not seem to respond to the smaller doses, and for the most part this lack of response was due to the presence of complications or preexisting diseases It is not known, of course, whether these complications would have been prevented or modified if larger doses had been given from the outset It was our impression, however, that they would not have been, and that the failures were not due to inadequate doses of the antibiotics We feel that a daily dose of 1 gm of either aureomycin or chloramphenicol is adequate for the majority of patients with bacterial pneumonias, but cannot be recommended as optimal for all cases at the present time In pneumonias caused by gram-negative bacilli, and especially Friedlander's bacillus, 3 or 4 gm daily is certainly indicated, at least until more information is available

At the beginning of the study it was anticipated that an appreciable number of viral pneumonias would be encountered However, there were only three patients in whom this diagnosis was established It therefore seemed wise to discard these three cases from the study, along with 18 others who were treated, but who on review were not found to meet the criteria for a diagnosis of bacterial pneumonia

Complications (Table 6) were similar in incidence and severity to those which have been observed in pneumonias treated with penicillin, and in previous studies with aureomycin Sterile pleural effusions were noted in four patients, and there were two pneumococcic empyemas Preparations of aureomycin and chloramphenicol suitable for intrapleural installation are not yet available and therefore empyemas, when they appear, must be treated with penicillin The two patients with pneumococcic meningitis are of special interest One, who had the full blown picture of meningitis on admission, showed some improvement in the spinal fluid findings on intensive aureomycin therapy, but cultures of the spinal fluid remained positive After three days he was started on penicillin, and the spinal fluid was sterile 24 hr later In the other patient signs and symptoms developed 18 hr after chloramphenicol therapy was started Definite conclusions cannot be drawn from two cases, but it is our opinion that in the treatment of pneumococcic meningitis aureomycin and chloramphenicol, which are primarily bacteriostatic in their action, are probably inferior to penicillin, which causes actual killing of pneumococci

There were seven deaths in the series (7%), which is a relatively low mortality rate in view of the fact that 59 of the 100 patients were over 50 years of age Of the seven deaths, only four can be definitely attributed to pneumonia or its complications (Table 6) In the other three patients, coexisting diseases played a major role in determining the fatal outcome (These results are comparable to past experience with penicillin at this hospital In 1949, 68 cases of bacterial pneumonia were studied Thirty-six [53%] of these were in patients who were over 50 years of age Blood cultures were positive in nine [13 5%] and there were six deaths [8 8% mortality])[9]

SUMMARY AND CONCLUSIONS

From Jan 1 to June 15, 1950, 50 patients with bacterial pneumonia were treated with aureomycin, and 50 with chloramphenicol Of the 100 patients, 76 had proved pneumococcic pneumonia, and blood cultures were positive for pneumococci in 15 (20%) In five, the pneumonia was caused by gram-negative bacilli, and in the remaining 19 the etiologic agent could not be definitely determined

The response to therapy was good in both groups, and superiority could not be claimed for either antibiotic

Complications occurred in 16 patients in the entire series There were seven deaths, only four of which could be attributed to pneumonia alone

Pneumococci isolated from the patients treated were somewhat more susceptible in vitro to aureomycin than to chloramphenicol On the other hand, blood serum concentrations four hours following the ingestion of 1 gm of chloramphenicol were considerably higher than those obtained with aureomycin It would appear that the greater susceptibility of pneumococci to aureomycin in vitro was offset by the higher blood levels attained with chloramphenicol, making the clinical effectiveness of the two antibiotics approximately equal, gram for gram

Eighty-one of the 100 patients were treated with 1 gm of aureomycin or chloramphenicol daily, given in a single dose, and the results with this regimen were in general excellent This dosage is certainly adequate for the majority of patients with pneumococcic pneumonia, but our study does not permit the conclusion that it is definitely optimal for all cases Larger doses are indicated in the treatment of pneumonias caused by gram-negative bacilli, especially in those caused by Friedlander's bacillus

HYPOPROTEINOSIS OF CHILDHOOD

Harold D Lynch, M.D
and
William D Snively, Jr , M D , Evansville, Ind

For many years we have encountered a repetitious combination of complaints in office practice with children The familiar list includes poor appetite, failure to gain weight and to grow normally, irritability, frequent gastrointestinal upsets, including vomiting and constipation, repeated bouts of infectious disease, dental caries, and pallor Frequently when a child has been brought in with one or two of these conditions as presenting symptoms, history and examination have revealed others

Gradually we came to realize that this combination of complaints is consistently associated with a certain type of dietary history The child's diet is nearly always adequate in minerals and vitamins but is not adequate in protein Ordinarily milk and carbohydrate foods are taken in large quantities, but meat, eggs, and other protein foods are neglected Prompt and dramatic response to provision of adequate protein has established this syndrome, in our minds, as a true deficiency disease

Surprisingly little has been written concerning the effects of protein deprivation on the infant and child except under conditions of rather severe deficiency[1] It is timely, we feel, to call attention to this milder form of protein deficiency, which we are convinced is one of the most prevalent clinically manifested deficiency diseases which affect children We have chosen to call this syndrome hypoproteinosis of childhood, in accordance with the terminology suggested by Miranda[2]

This is a preliminary report based on purely clinical observations, as exemplified by the following brief case reports, which are typical of hundreds in our files

REPORTS OF CASES

CASE 1 —*Presenting Complaint* —G B , a 20 mo -old white boy, was brought in because of irritability, listlessness excessive sleeping, failure to gain weight, and frequent infections of the upper respiratory tract

History —The boy had had these complaints for months He had been treated with repeated courses of sulfonamides and had been given several courses of liver' and thyroid presumably 'for anemia ' The dietary history revealed that he refused to eat solid foods except for high-carbohydrate tidbits He customarily drank at least a quart (950 cc) of milk daily

Salient Physical Findings —The child was poorly nourished His tissue turgor was poor He was pale and irritable

Laboratory Findings —Blood studies revealed a hypochromic microcytic anemia The hemoglobin content was 11 gm per 100 cc The red blood cell count was 3,500 000

[2] Miranda F de P Nutrition and Endocrinology with Special Reference to the Nutrition of the Mexican Indian J A M A 130 542-545 (Feb 21) 1948

Treatment.—A high protein diet, excluding milk, was prescribed. Small doses of ferrous sulfate were given.

Progress.—The child's general condition immediately improved. Infections of the upper respiratory tract were greatly reduced in number and severity. The appetite improved remarkably. The child gained weight, his irritability and listlessness disappeared, and his color became essentially normal.

Case 2.—*Presenting Complaint.*—J. T. B., a 4-yr.-old white boy, was brought in because of easy fatigability, nervousness, refusal to eat, and refusal to swallow food after chewing it. He often held his food in his mouth for hours.

History.—This only child lived with his parents and grandparents. He was subjected to much coaxing and bribing at meal time. Although he had always drunk quantities of milk and eaten crackers and cookies between meals, he refused to eat meat and other solid foods at the table.

Salient Physical Findings.—Obstreperous before the mother and grandmother left the examining room, this child became cooperative afterward. He was poorly nourished and had poor tissue turgor and mild pallor.

Treatment.—A high protein diet, excluding milk, was suggested. The mother and grandmother were receptive to the idea that the child's problems were due to their attitudes. Instructions were given that the child was to feed himself and not be fed. He was not to be denied the privilege of getting hungry. It was pointed out that the normal child will swallow when hungry.

Progress.—One month later the child had made an excellent weight gain. His appetite was good. His general appearance improved. There was no protest at the examination, even with the mother and grandmother present. His ready fatigability had lessened. He looked forward to his meals. The cooperative attitude of parents and grandparents made management in this instance easy and results gratifying.

Case 3.—*Presenting Complaint.*—E. T. and J. T., 6 yr.-old white twins, one male and one female, were brought in from another city for routine checkup.

History.—The boy as an infant had shown great reluctance in being weaned from strained foods. He drank quantities of milk and ate many sweets between meals. He ate little of solid foods. The girl had never liked milk but did eat quantities of meat, vegetables, cheese, and other solid foods.

Salient Physical Findings.—The boy was only fairly well nourished. He had considerable dental caries. The girl was well nourished, weighing 1½ lb. (0.75 kg.) more than her brother, and had excellent teeth.

Treatment.—A high-protein diet, without milk, was outlined for the boy. No change was suggested in the dietary management of the girl.

Progress.—In one month the boy's appetite was on a par with the girl's. He had made an excellent weight gain.

Case 4.—*Presenting Complaint.*—D. H., a 16 mo.-old white girl, was brought in because she refused to eat anything but strained foods and vomited when coarser foods were fed.

History.—This child had always drunk milk through a nipple and was taking a quart or more daily at the time we saw her. When attempts were made to feed coarser foods, she refused them or gagged and vomited so that the mother was afraid to offer them. She ate crackers and cookies between her bottle feedings.

Salient Physical Findings.—The girl was fairly well nourished. There were no other pertinent findings.

Treatment.—The importance of other foods in addition to milk was stressed. The bottle was discarded, and milk was discontinued temporarily. Strained foods were excluded. The girl was to be permitted to get hungry enough to take and swallow chopped foods.

Progress.—One month later the child had made an excellent weight gain, and her appetite had improved dramatically. Her vomiting had subsided.

Case 5.—*Presenting Complaint.*—D. I., 2½-yr.-old white boy, was brought in because of refusal to swallow anything but liquids. He had crying and breath holding spells which resulted in unconsciousness. He slept excessively, appeared to have no energy and was constipated.

History.—The child had shown the aforementioned symptoms for months. He had drunk milk from a feeding bottle through a nipple in the amount of a quart or more daily. He ate many graham crackers between feedings.

Salient Physical Findings.—The patient appeared fairly well nourished but was moderately pale. He was exceedingly irritable and cried considerably while being examined.

Treatment.—A high protein diet was prescribed, with milk temporarily excluded. The importance of hunger was emphasized. Between meal snacks were forbidden. The child's need for only one or two good meals daily was explained.

Progress.—In several follow-up visits excellent and progressive weight gains were observed. The appetite was greatly improved. The child was more alert and slept less. His breath holding spells had been discontinued since the first visit.

Case 6.—*Presenting Complaint.*—R. G., a 3½-yr.-old white boy, was brought in because of repeated bouts of otitis media.

History.—Tonsillectomy had been performed at the age of 2½ yr. because of frequent infections of the upper respiratory tract. The child had received repeated courses of antibiotics and sulfonamides. He had gained weight poorly, had a poor appetite, slept poorly, and was constipated. He drank large quantities of milk and frequently nibbled on cookies and crackers between the battles which were his meals. He refused to swallow food at the table.

Salient Physical Findings.—This only child was poorly developed and slender and appeared not to be well nourished. His tissue turgor was poor. He had a seropurulent discharge from the right aural canal.

Treatment.—The importance of protein in the diet was emphasized, as was the importance of permitting the child to become hungry. A high protein diet was prescribed. All food except fruit was excluded between meals. It was emphasized that the child must feed himself and must be dismissed from the table when he showed lack of interest in food. He was not to be punished with food.

The otitis media was treated with aureomycin, with prompt recovery.

Progress.—In one month the child gained 2 lb. (0.9 kg.). His appetite improved remarkably, his sleeping habits were better, and his constipation had been relieved.

Case 7.—*Presenting Complaint.*—J. S., a 19 mo.-old white girl, was brought in because of repeated episodes of high fever and breath holding spells and poor teeth.

History.—The infant was constipated and had been given castor oil daily for many weeks. She perspired a great deal. She refused all foods except milk and starches, and had done so since early infancy. Her milk intake was from 1 to 2 qt. (950 to 1,900 cc.) daily. The only other foods she ate were cereals, bread, cookies, crackers, and potatoes.

Three siblings were much older, the next in age being 14 yr. her senior.

Salient Physical Findings.—This infant was large but flabby. All her primary dentition was badly decayed. The upper front incisors had been extracted. She had a breath holding spell while being examined.

Treatment.—The parents, who were well-to-do farm people, were convinced that the child's plight was due to their oversolicitude. It was a revelation to them when it was pointed out that their own farm stock had been getting a much better diet than their infant. A high protein diet was prescribed, milk was excluded.

Progress.—In several follow up visits it was observed that the child had improved dramatically. Her tissue turgor became normal, her disposition improved. She had had no more breath holding spells since the first visit to the office. Her constipation was relieved. In a period of 18 mo. she had had no infection.

Case 8.—*Presenting Complaint.*—J. D., a 3 yr. old white boy was brought in because of frequent infections of the upper respiratory tract, poor appetite, and constipation.

History.—The child had always drunk considerable amounts of milk and had eaten carbohydrate foods and confections between meals. He had consistently refused meat and vegetables.

Salient Physical Findings.—This patient was poorly developed and nourished. His tissue turgor was poor, he had mild pallor, and his feet were moderately pronated.

Treatment —A high protein diet was prescribed, milk was excluded The parents were instructed to stop forcing the child to eat and to allow him to get hungry Confections and soft drinks were excluded from the diet We were apprehensive about parental cooperation because the father was a soft drink dealer

Progress —In several follow up visits the child made excellent progress His pallor disappeared He gained weight His appetite became good, his sleeping improved, and his constipation was corrected

CASE 9 —*Presenting Complaint* —L W, a 9½-yr-old white boy, was brought in because of poor teeth, frequent spells of vomiting, poor appetite, and frequent stools

History —This only child drank large amounts of milk and soft drinks He ate cookies and crackers between meals He refused meat and vegetables

Salient Physical Findings —This child was poorly developed and nourished He was moderately pale Several teeth had been extracted, and there were numerous unfilled large cavities

Treatment —A high-protein diet was prescribed, and milk was excluded Small doses of ferrous sulfate were given

Progress —A month later the child had made an excellent weight gain No further infection of the upper respiratory tract had occurred His appetite had definitely improved

SYMPTOMATOLOGY

Anorexia —A constant symptom is anorexia Anorexia is perhaps the most frequent complaint with which the pediatrician is confronted There is much confusion concerning this term It often means one thing to the parent and something entirely different to the physician Loss of appetite due to disease, such as infection, is usually of brief duration The parents seldom have time to get seriously worried about it Periodic reduction of appetite which occurs during the growth and development of the child may be disconcerting because it recurs and at times appears to last indefinitely Parents often regard this physiological disinterest in food as complete loss of appetite Failure to realize that the phenomenon is normal at certain ages leads to distressing family conflicts These conflicts set off a chain of reactions which may produce a state of malnutrition and true anorexia Thus, anorexia, while it is a result of hypoproteinosis, is also one of the principal causes

Failure to Gain Weight —Children with hypoproteinosis frequently fail to gain weight Misconceptions concerning the rate of weight gain in childhood parallel those concerning anorexia True failure to gain, which occurs in disease and malnutrition, is cause for concern On the other hand, a normal slowing of the rate of gain is often mistaken by parents for a failure to gain, and, like the concurrent reduction in appetite, leads to anxiety and to forcing of foods A forced diet is usually a poorly balanced diet and one low in protein Hypoproteinosis develops, and poor tissue turgor and poor muscular development are inevitable accompaniments

Vomiting —Vomiting as it occurs in hypoproteinosis is reminiscent of the cyclic vomiting described in the literature of former years [3] The dramatic relief obtained when the protein intake is rendered adequate demonstrates that organic factors are important in the causation of the vomiting In addition, psychogenic factors induced by parental oversolicitude play a part in the development of this ability to vomit Children with the syndrome learn to reject food on the slightest provocation, and there is daily provocation

Constipation —Constipation is frequently observed It is probably caused both by improper intestinal contents resulting from the unbalanced diet and by the poor muscle tone of the protein-deficient child [1a, b]

Increased Susceptibility to Infections —Frequent infections are observed in this group of children Contagious disease is apt to be unduly severe Persistent boils and styes occur Infections of the upper respiratory tract are frequent The importance of protein in defense against infection has been shown repeatedly [4] Evidence exists that diets inadequate in protein are significant in the rheumatic state and in tuberculosis [5]

Dental Caries —Protein is essential for normal formation of bone, and the influence of protein on the utilization of calcium has been shown to be of paramount importance [6]

Dental caries has been consistently found in our patients with hypoproteinosis Surveys among Eskimos and Indians have indicated a lower incidence of caries among those consuming a high protein, high fat diet [7] than in those subsisting on high-carbohydrate diets

Many of our patients with hypoproteinosis have had rampant dental caries with one or more abscessed teeth, and the nutritional status has not been improved until the abscessed teeth were removed This is in keeping with the observation that infection interferes with nitrogen balance [8]

Anemia —Poor color is frequently the presenting complaint in these patients with hypoproteinosis The anemia of hypoproteinosis appears to be a hypochromic anemia Massive doses of iron in the absence of adequate protein intake do not cure it When sufficient protein is provided, however, and small doses of iron are given, the response is immediate This repeated observation has convinced us that the anemia is as much due to lack of protein as to lack of iron and that protein is essential to its cure The necessity of adequate amounts of both iron and protein for normal hemoglobin formation is well-known[9]

Laboratory Data —As we stated earlier in the paper, this preliminary report is based on clinical observations Laboratory work in our office practice has been limited to routine urinalysis, with other tests performed only when specifically indicated The only significant laboratory evidence which we have to offer at the present time relates to the rather frequent observation of a hypochromic anemia

Studies are now under way which are designed to determine the blood picture in all patients with hypoproteinosis These studies will endeavor, among other things, to determine the actual blood protein level in patients with mild hypoproteinosis and the value of the hemoglobin level as a criterion of hypoproteinosis

DIAGNOSIS

The diagnosis of hypoproteinosis in childhood is based on the dietary history and the signs and symptoms just discussed There is no satisfactory simple laboratory test for moderate protein deficiency It is usually not feasible to do special blood studies in private practice on ambulatory patients who do not appear to be in serious trouble

A dietary history, taken carefully and properly evaluated, is essential for diagnosis Typically, there is a history that the child is a good milk drinker but that "he does not eat" at mealtime It is usually admitted somewhat reluctantly that the child does eat as he pleases between meals, usually such foods as "cookies, crackers, soft drinks, and candy," all highly refined carbohydrate foods

The pitfalls in taking a dietary history are legion. Reactions to questions are likely to be influenced by what is assumed to be the right answer Moreover, parents frequently do not have accurate knowledge of the amounts of various foodstuffs actually eaten by the child The question "Does Junior eat meat?" may be answered by an emphatic "Yes" from the mother Further probing is likely to reveal that he eats a bite or two of meat but a plateful of potatoes and bread A detailed story of the child's food intake shows a predominance of starchy foods, milk, and sweets and an almost total absence of solid protein foods, such as meat and cheese Analysis of this diet reveals an inadequate protein content[10]

History taking further reveals that parents often think children eat the same foods because they eat at the same table It is not unusual to find that one sibling may be in an excellent state of nutrition while another suffers from hypoproteinosis (Case 3) One may prefer meat, cheese, and fruits, the other, starches and milk Calculation of the siblings actual intake of protein, fat, and carbohydrate reveals startling dissimilarities

ETIOLOGY

What is the cause of childhood hypoproteinosis? The condition is certainly understandable in the poverty-stricken The cost of protein foods is relatively high, while starches and sweets are inexpensive But why should children in families in which no expense is spared frequently consume a diet woefully deficient in protein? The basic reason is a general lack of understanding by parents of the fundamentals of nutrition

Painstaking efforts have been directed toward teaching the laity some facts about food requirements Sources of lay information are, however, limitless and often unreliable, and many of the popular theories have little in common with facts

There is a tendency to overemphasize certain articles of diet, particularly milk because of its calcium content. Calcium, one of many essential nutrients, has so fired the public imagination that it is often the primary parental concern in the nutritional management of the growing child Vitamins also have been made to loom importantly in the lay mind Children of today are exposed to an array of highly advertised, palatable concoctions that did not exist a generation ago Grandparents and other fond relatives shower children with tasty tidbits Few parents, however, have heard of the term "protein" in connection with the nutrition of their children

Superficially it might seem that if the child drinks milk in liberal quantities his protein intake should be adequate Milk, however, provides only 1 gm of protein to the ounce (30 gm) The recommended daily allowance of protein for young children is 40 to 50 gm[11] Even a quart of milk a day will not provide sufficient protein for adequate growth and development, and the consumption of this much milk at certain ages is likely to spoil the child's appetite for the solid foods, such as meat, eggs, and cheese, that make a much greater protein contribution in proportion to their bulk

Little has been done, moreover, in educating parents on the changing nutritional requirements during different phases of growth and development. It is seldom pointed out that growth and appetite, rather than energy and appetite, are interdependent Since growth does not occur in steady increments but accelerates and decelerates at various age levels throughout childhood, appetite of necessity must vacillate at different ages And energy expended has little to do with the quantity of food the child will consume

Psychological factors loom large in the etiology of cases of hypoproteinosis seen in private practice Mother is determined to see that her child gets the proper foods (particularly milk) in quantities which she has been led to believe his energy and increasing age necessitate This often is in conflict with the child's fluctuating growth needs This conflict is especially likely to originate in the second year of life The rate of weight gain decreases when children approach the end of the first year The 2 yr old's rate of gain is about one-sixth that of the 4-mo - old infant A period of minimum weight gain is reached when the child is about 2 to 2½ yr of age At this age he does not need or want much food His interests are elsewhere His personality and his aggressiveness are developing On the other hand, the mother's instinctive interest in feeding her child has not waned She does not understand why this runabout does not share her enthusiasm for the feeding process She becomes frantic lest her child will not gain as much as the neighbor's or will not eat every article of food that she thinks necessary As the mother's anxiety and determination increase, the assertive child's persistence in refusal likewise increases It then becomes a matter of "getting something into him " This something is usually the wrong kind of food and is almost invariably lacking in protein The sweet, starchy foods taste better Subsequently, hypoproteinosis becomes manifest.

MANAGEMENT

The treatment of hypoproteinosis is sometimes not simply that of prescribing a diet adequate in protein When hypoproteinosis is due to improper parental attitudes and feeding technics, education is required It is difficult to dislodge preconceived notions concerning nutrition One effective way to attack these mistaken ideas is to compare the nutritional care of children with that accorded animals It is pointed out that animals could not survive a diet of the highly refined carbohydrate food permitted children Parents are appalled to learn that their dogs and cats and farm animals are given better diets than their children

Moderately High Protein Diet

Breakfast	Noon
Fruit juice	Fruit
Egg bacon or ham	Cottage cheese egg or meat
Cereal or toast and butter	Bread or crackers and butter
4-6 oz. (120-180 gm) of milk *	4-6 oz. of milk *

Evening

Vegetables
Meat fish or chicken
Bread and butter
Fruit or gelatin dessert
4-6 oz of milk *

---

* Omitted if child has previously consumed large quantities of milk to the exclusion of other foods

An attempt is made to add the term "protein" to the lay repertory, along with "calcium" and "vitamins " The parents are given a list of the important foods rich in protein Minerals and vitamins are properly placed in the scheme of things We then try to convince parents that it is not how much the child eats but what he eats that is essential to his nutritional well-being The accompanying table presents an outline of a moderately high protein diet

With the child who has been consuming large quantities of milk to the exclusion of other foods, the transition to a diet adequate in protein is facilitated if milk is excluded Attempts to taper off the milk intake invite failure of the whole program It is necessary to reassure parents that no calamity will befall the child if he does not receive milk for a time Amazingly, after these children have been on a milk-free diet for a short period they seldom have the same craving for it when it is introduced again

A special effort is made to explain that while the diet lists three full meals the child should not be expected to eat all of them We emphasize that consuming two good meals a day should be the probable limit of our expectation for the preschool child The child's attitude and desires at breakfast usually determine what to expect at subsequent meals Many children have a marked distaste for breakfast, as do many adults In this event the noon meal is usually the large one On the other hand, with some children breakfast is the largest meal of the day In this case lunch will probably be a light meal, and the evening meal will be well taken Parents must be admonished not to make the mistake of trying to stuff a runabout child with three large "harvest hand" meals daily

Another point to be emphasized is the great importance of hunger Its gratification is a pleasant sensation Yet most children are never permitted the privilege of getting hungry The mother dreams of her child being hungry enough to sit down and enjoy a good meal, but she will not permit him to become this hungry She is dismayed when it is pointed out that her child is actually underprivileged in that he has been denied gratification of the sensation of hunger

Parents must be impressed with the value of a pleasant atmosphere at mealtime Nagging and forcing of food make these family gatherings a thing to be dreaded, and even accompanied by tears, so that no one eats well Since emotions exert a powerful influence on appetite, it is no wonder that the child will eat only between meals —when he is free of nagging and cajolery The child should be taught that the eating of meals is a privilege, not a duty No attempts should be made to force or even to urge him to eat He should not be allowed to think, however, that he has come to the table to be entertained If he is disinclined to eat, he should be promptly dismissed from the table Cooperation of all members of the family and consistency of attitude and practice are essential

It is impossible for parents to make the complete reversal of their attitudes outlined here unless they understand why it needs to be done The physician must be willing to spend time and to give proper attention to detail if hypoproteinosis in children is to be effectively combated When full parental cooperation and acceptance of the program are obtained, results are dramatic

SUMMARY AND CONCLUSIONS

A group of symptoms ordinarily taken as individual and unrelated complaints have been recognized as belonging to a common syndrome, designated as hypoproteinosis These symptoms include anorexia, failure to gain weight, gastrointestinal disturbances, including vomiting and constipation, frequent bouts of infectious disease, dental caries, and anemia The dietary history usually reveals liberal consumption of milk and carbohydrate foods, as well as adequate intake of minerals and vitamins, but insufficiency of solid protein foods, such as meat, eggs, and cheese Difficulties in taking the dietary history are manifold Yet a proper dietary history is essential for diagnosis Effective management not only requires a diet ample in protein but has educational and psychological facets as well Recognition of this problem and of its solution will spectacularly improve the health and well-being of children and will be a source of gratification to parents and physicians alike

CYTOLOGICAL STUDY OF THE UPPER GASTROINTESTINAL SEDIMENT

ITS VALUE, AS CORRELATED WITH ROENTGENOLOGIC AND CLINICAL FINDINGS, IN THE DIAGNOSIS OF CANCER

Joseph E Imbriglia, M D , George N Stein, M D
and
Mieczyslaw S Lopusniak, M D , Philadelphia

Since August, 1948, cytological examination of sediment obtained from the upper gastrointestinal tracts of more than 100 patients has been performed at Graduate Hospital of the University of Pennsylvania The data obtained by this procedure in the diagnosis of cancer have been compared with the roentgen interpretations, and each datum, in turn, has been correlated with the clinical, surgical, or autopsy findings Almost all the patients examined were clinically suspected of having organic disease of the upper gastrointestinal tract and were referred for study by the surgeons or gastroenterologists of Graduate Hospital These patients were studied by cytological and roentgenologic examinations

PROCEDURE

As a preparation for the aspiration of gastric sediment, the patients were requested to fast for eight hours A 16 F Rehfuss tube, containing additional perforations in its distal 6 cm to facilitate more complete aspiration, was passed, with fluoroscopic guidance

When gastric sediment was to be examined, the patient was placed in the supine position with the tip of the tube well into the antral portion of the stomach The fasting residuum was aspirated and retained The stomach was lavaged five or six times with approximately 50 cc of isotonic sodium chloride solution each time The patient was rotated so that the mucosa of the entire stomach was "washed down" thoroughly The fasting and lavage specimens were then centrifuged at high speed, without delay, for 20 minutes Following centrifugation, the supernatant fluid was drawn off and smears were made of the sediment on albumin-coated slides, these were fixed before drying in equal parts of 95% ethyl alcohol and ether Ordinarily, 300 cc of lavage will yield enough sediment to make 12 to 15 slides for cytological examination After fixation, the slides were stained by the technique employed by Papanicolaou [1a]

In suspected esophageal lesions, the tube was passed with the patient erect The tip of the Rehfuss tube was positioned immediately distal to the lesion The patient was asked to swallow a mouthful of isotonic sodium chloride solution, and five seconds thereafter aspiration was initiated by applying suction by means of a large syringe This process was repeated until approximately 300 cc of fluid was collected The lavage specimens were then treated in the same manner as the gastric specimens

When, as a result of gastric retention, there is more than the usual amount of fasting residuum, the cytological examination is frequently unsatisfactory because the desquamated epithelial cells become lost in the débris and autolysis of the tissue cells results from the action of the gastric juice It cannot be overemphasized that cytological study of the residual contents of a retentive stomach is most difficult

Almost all the roentgenograms were reported by residents in training No attempt was made to review the films for diagnostic purposes for this report The statistics were gathered from the original interpretation

All patients were grouped into five categories anatomically, depending on the roentgen location of the lesion the esophagus, cardia of the stomach, body of the stomach, antrum or pylorus

ESOPHAGUS

A very high degree of accuracy was achieved by both the cytological and roentgenologic methods in the diagnosis of esophageal lesions A total of 13 patients was examined, eight of these had cancerous lesions, and the remainder had benign lesions

All except one of the cancerous lesions were correctly diagnosed cytologically In that one case the clinician requested an examination of the gastric sediment The tip of the Rehfuss tube was passed to the antrum of the stomach and the gastric mucosa was lavaged with isotonic sodium chloride solution This emphasizes the importance of obtaining material (desquamated epithelium) from the proximity of the lesion All the cancerous cases were correctly diagnosed by the roentgen method The five benign esophageal lesions were correctly diagnosed by both methods (table 1)

CARDIA

Of the 12 lesions found in the cardia of the stomach, two were malignant and 10 were benign

In the cancerous group, the cytologist incorrectly diagnosed one lesion as benign The roentgenologist correctly diagnosed one as cancerous, the second was diagnosed as equivocal

In the benign group, the cytological method yielded only one error among the 10 patients studied The

roentgen method incorrectly diagnosed two of the 10 as cancerous and four as equivocal (table 2)

The roentgenologic evaluation of benignancy or malignancy of lesions of the cardia is difficult, the results obtained here vary little from the percentage of error generally experienced Many of the roentgenologically demonstrated defects of the cardia were considered equivocal or cancerous, this is understandable, since benign pathologic processes do not commonly occur at this site Most of these patients underwent exploratory operations and in some the surgeon was unable to explain the roentgen configuration The rather high degree of accuracy obtained by the cytological method seems to indicate that cytological studies should be done routinely when abnormalities are discovered by roentgen examination.

Total	5	5			5	

* Desquamated epithelium was obtained from the stomach instead of from the esophagus

BODY

There were 35 patients with lesions located in the body of the stomach, 17 of the lesions were malignant, 18 were benign

Of the cancerous lesions examined cytologically, 15 were correctly diagnosed as malignant and two incorrectly, as benign In each of the incorrectly diagnosed cases, the lesion was an infiltrating intramural carcinoma, since the mucosa was not involved, the desquamated cells that were examined presented a normal appearance Errors such as these are inherent in the technique and cannot be eliminated Only one of the 17 cancers was diagnosed incorrectly by the roentgen method This, too, was an infiltrating intramural carcinoma

TABLE 2 —*Comparison of Roentgen and Cytological Diagnoses in Lesions of the Cardia of the Stomach*

		Roentgen Diagnosis			Cytological Diagnosis

Polypoid lesions	6	2	1	3	5	1
Ulcerating lesions	3	1	1	1	3	
Normal	1	1			1	
Total	10	4	2	4	9	1

Only one of the 18 benign lesions was incorrectly diagnosed (false positive) by the cytological method The roentgenologist, however, diagnosed five incorrectly as cancerous and two as equivocal in this same group (table 3)

ANTRUM

Of the 13 lesions in the antrum of the stomach, four were malignant and nine benign All four of the cancers were correctly diagnosed by the cytological study Three lesions were correctly diagnosed by the roentgen study, the fourth was interpreted as equivocal In the group of nine benign lesions, there were two false positives demonstrated by the cytological method The roentgenologist diagnosed one of these nine benign lesions as malignant and two as equivocal (table 4)

PYLORUS

There were 12 lesions located in the pyloric canal, all of which were benign Only one false positive reaction was obtained by the cytological method Roentgenologically, eight were correctly diagnosed as benign, but four were incorrectly interpreted, two, as malignant and two, as equivocal (table 5)

TABLE 3 —*Comparison of Roentgen and Cytological Diagnoses in Lesions of the Body of the Stomach*

The data on all nonmalignant or benign cases are listed in table 6

The data on all cancerous cases are listed in table 7

COMMENT

Recent papers dealing with the application of the cytological method to the diagnosis of cancer of the stomach report accuracies ranging from 35 to 74% [1]

We agree with Swarts and his associates,[16] who state that unsatisfactory specimens are largely responsible for the poor results For that reason we took particular care, as described above, to obtain satisfactory specimens Two of us (J E I and M S L) personally lavaged the stomach, obtained the specimens, centrifuged them, and prepared the slides All the slides were examined by one of us (J E I) It is only when painstaking care is given to these details that accurate results can be obtained

The roentgenologic and cytological methods are equally accurate in the diagnosis of cancerous lesions regardless of their location in the esophagus or stomach The location and gross pathologic character of a lesion are features discernible by roentgenologic and endoscopic examinations A cytological diagnosis of cancer is an important one, its accuracy is affected only by the care with which the specimens are obtained and by the experience of the cytologist

TABLE 5 —*Comparison of Roentgen and Cytological Diagnoses in Lesions of the Pyloric Canal*

Proved Benign Cases	Number of Cases	Roentgen Diagnosis			Cytological Diagnosis	
		Benign	Malignant	Equivocal	Benign	Malignant
Polypoid lesions	2	1	1		2	
Infiltrating lesions	8	5	1	2	7	1
Ulcerating lesions	2	2			2	
Total	12	8	2	2	11	1

Although the cytological study gave a higher number of correct diagnoses in the benign lesions, we believe that too much reliance should not be placed on a negative or noncancerous report False negative findings may result (1) if sediment is improperly obtained from a retentive stomach, (2) if the lesion does not involve the mucosa, and (3) if an ulcerating cancer has become secondarily infected

In our opinion, the cytological examination of sediment is an important and valuable adjunct to roentgenography and endoscopy in the diagnosis of cancerous lesions of the esophagus and stomach Two intraepithelial carcinomas, one esophageal [2] and the other gastric, were correctly diagnosed cytologically, thus giving promise for the diagnosis of cancer before it is advanced If enough properly trained cytologists were available, it might be feasible to use this method for mass surveys

TABLE 6 —*Correlation of Diagnoses of 71 Proved Noncancerous Cases*

Roentgen Diagnosis			Cytological Diagnosis	
Benign *	Cencerous	Equivocal	Benign *	Cancerous

Roentgen Diagnosis			Cytological Diagnosis	
Benign	Cancerous	Equivocal	Benign	Cancerous
1	28	2	4*	27

* One patient had cytological studies of the stomach but cancer was in the esophagus

SUMMARY

Cytological and roentgenologic examinations were performed on more than 100 patients with gastrointestinal complaints These findings were compared with the clinical, surgical or autopsy findings

In 31 cases in which cancer was ultimately proved, the cytological results were accurate in 27 The roentgen diagnosis was of about the same degree of accuracy, being correct in all but three cases

In 71 cases in which no cancer was found, the cytological results were correct in 66, the roentgenologic results were correct in only 51 cases

The value of a noncancerous or negative cytological diagnosis has not yet been determined

The care used in obtaining the specimens and the experience of the cytologist undoubtedly account for the high degree of accuracy

Despite the known difficulties associated with the procedure, cytological examination should be employed in all cases of suspected cancer, as a procedure complementary to roentgenography and endoscopy

CLINICAL NOTES

LEPTOSPIRAL INFECTION IN MAN TREATED WITH TERRAMYCIN

REPORT OF A CASE

Daniel Liebowitz, M D
and
Harold Schwartz, M D , Cleveland

Several reports of Leptospira icterohaemorrhagiae infection in man treated with penicillin and aureomycin have appeared in the recent literature [1] One report dealing with the use of penicillin stated that rapid clinical improvement was observed within a 36 hour period in 16 patients [1b] However, the general experience has been that if penicillin does affect the disease, it does not do so dramatically [2] Two recent papers suggest that aureo-

mycin is an effective therapeutic agent in this disease [3] The purpose of this report is to describe a case of Leptospira infection and its dramatic response to terramycin

REPORT OF A CASE

C D, a white man, 56, was admitted to the Veterans Administration Hospital, Cleveland on Aug 7, 1950 complaining of weakness, poor appetite, and diarrhea of five days duration The patient noticed that his skin had become yellow, his urine dark, and his stools light in color during this period Past history revealed that he had been employed as a railroad clerk for many years and that he was treated for heart trouble" in 1947 He said he had drunk four to five bottles of beer daily most of his life There was no evidence of an inadequate dietary intake

Physical examination on admission revealed a deeply icteric, semistuporous white man who appeared acutely ill Oral temperature was normal, respirations were 16 per minute and were deep and regular There was a regular sinus tachycardia of 100 per minute The blood pressure was normal There were scattered areas of purpura over the high shoulder, thorax and abdomen There was a hemorrhagic herpetic lesion on the lower lip, and a necrotic ulceration of the soft palate and uvula was present The lungs were clear to auscultation and percussion except for an occasional high pitched wheeze at the bases The heart was slightly enlarged to percussion, and the sounds were of poor quality The liver was enlarged to the level of the umbilicus and was tender to palpation There was generalized shotty lymphadenopathy Neurological examination revealed residuals of an old right peripheral facial paralysis The remainder of the physical examination was normal

Laboratory Data—Examination of the blood showed a mild anemia The peripheral white cell count was 16,000 with 92% neutrophiles Stool examinations were positive for occult blood for the first five days of hospitalization Urinalysis revealed 2 + albuminuria on two occasions with many granular casts in the sediment Bile was present in the urine repeatedly, while urobilinogen, at first absent, later appeared in normal amounts The blood urea nitrogen was 80 mg, and nonprotein nitrogen was 109 mg per 100 cc on admission Liver function tests were grossly abnormal Sulfobromophthalein (bromsulphalein®) sodium retention in one hour was 46% The icterus index was 459 units Serum bilirubin was 37 mg per 100 cc The Van den Bergh reaction at the end of one minute was 30 mg per 100 cc Total proteins were within normal limits but there was a relative decrease in the albumin fraction with an albumin globulin ratio of 1 1 The cephalin flocculation test was 4 + at the end of 24 hours The remainder of the liver chemistries including thymol turbidity, total and free cholesterol prothromin time, and alkaline phosphatase, were within normal limits Bleeding, clotting and clot retraction times were within normal limits A red cell fragility test was normal Spinal fluid examinations showed no abnormalities The chest roentgenogram on admission showed finely nodular and linear densities throughout both lung fields The cardiac silhouette was within normal limits

Hospital Course—The patient became progressively worse He remained in a semistuporous condition for the first five hospital days receiving several blood transfusions and parenteral feedings during this time Daily injections of 600 000 units of aqueous procaine penicillin were administered for the first five hospital days On the third hospital day a tentative diagnosis of leptospirosis was made, and blood was drawn for agglutinations The first agglutinations were reported positive on the fifth hospital day in dilutions of 1 1 000 for Lept icterohemorrhagiae and 1 650 for Lept canicola These titres were obtained with the use of dead organisms as antigen, and titres of 1 300 or over are considered diagnostic with the method used [4] On the fourth hospital day a routine electrocardiogram showed that the patient was having alternating periods of auricular flutter and fibrillation Digitalization promptly reverted the rhythm to normal On the same day a maculo-papular rash appeared on the thorax, abdomen, upper arms, and thighs, and he appeared moribund Since he had shown no response to penicillin, we decided to treat the patient with terramycin Penicillin, therefore, was discontinued, and 0.5 Gm of terramycin hydrochloride was administered every four hours by mouth Within 24 hours the stools had become negative for occult blood, and clinical improvement was noticeable After three days of treatment, the patient's sensorium had cleared He was alert, began to sit up in bed, and was taking food by mouth The maculo papular rash had begun to fade, and the herpetic lesion on his lip was drying up The necrotic lesions of the soft palate and uvula were healing, and the areas of purpura had disappeared Five days after treatment with terramycin was begun, the serum bilirubin had dropped from 37 1 mg to 12 1 mg per 100 cc, and the other liver chemistries had shown a concomitant trend toward normal The blood urea nitrogen gradually fell reaching a normal level of 20 mg per 100 cc by the 18th day of treatment A chest roentgenogram taken on the 16th hospital day, 11 days after initiation of therapy with terramycin, was reported as normal Convalescence was gradual, and on the 25th hospital day the patient was apparently well

Agglutinations on the 24th hospital day were again positive in dilutions of 1 1,000 for Lept icterohaemorrhagiae and 1 650 for Lept. canicola On the 37th and 44th hospital days, agglutinations with use of the dead organisms were reported as negative Blood drawn on the 40th hospital day was, therefore, sent to the United States Public Health Service Laboratories at Chamblee, Ga, where, living organisms being used as antigen, a positive titre in dilutions of 1 16,000 for Lept icterohaemorrhagiae and 1 2,048 for Lept canicola was obtained This method was considered far more sensitive than the method previously employed and was used chiefly as confirmatory evidence of the infection An even later serological examination done with live organisms 78 days after admission showed a positive titre for Lept icterohaemorrhagae in a dilution of 1 8,000 and for Lept canicola in a dilution of 1 256

COMMENT

It has become apparent that leptospirosis is a much commoner disease in this country than has been supposed [5] Until recently there has been no effective specific treatment for it The mortality of the disease has ranged between 4% and 60% in various series, with an over-all mortality of 30% [6] Jaundice and nitrogen retention make the prognosis extremely grave [6] The patient in our report was critically ill and, in spite of treatment with penicillin, became progressively worse He was distinctly icteric, in profound uremia, and appeared moribund Within 24 hours after the administration of terramycin hydrochloride, the patient exhibited dramatic clinical improvement We realize that no definite conclusions can be drawn from such a single experience, but the pronounced sudden improvement in the clinical course of this patient after this drug was begun appears to be more than coincidental

BACTEROIDES ENDOCARDITIS

REPORT OF A CASE SUCCESSFULLY TREATED WITH TERRAMYCIN

Lowell A Rantz M D, San Francisco

The organisms usually responsible for subacute bacterial endocarditis are of a low degree of invasiveness and are frequently or regularly present in the flora of the body cavities during health Nonhemolytic streptococci, enterococci, influenza bacilli, and coagulase-negative staphylococci are most commonly recovered from the blood in such patients Gram-negative, non-spore-forming, anaerobic bacilli of the genus Bacteroides are readily isolated from materials obtained from the nasopharynx, colon, and vagina in many persons It is well known that they may cause serious suppurative disease, but are a rare cause of subacute bacterial endocarditis[1]

This report describes a case in which a diagnosis of Bacteroides endocarditis was established, and in which therapy with terramycin was successful

REPORT OF CASE

Mrs A V was admitted to the hospital in January, 1950 for study of a febrile illness of nine months duration She had had rheumatic fever on two occasions (at the ages of 7 years and 13), but had otherwise been well and active

Her present illness began with the discovery of fever during a routine prenatal examination by her physician in May, 1949 She had then been pregnant for six months No clinical evidence of disease was discovered, and she felt quite well Her maximum temperature varied between 100 and 102 F daily, but she did not feel ill during the subsequent two months

A blood culture was obtained when she was admitted to the hospital in July, 1949, for delivery An organism was isolated, but details as to its nature are not available Penicillin was administered for one month in unknown dosage, followed by 1 gm daily of aureomycin for seven weeks Treatment was concluded about Oct 1, 1949

Since that time she had felt very well Serial blood cultures at fortnightly intervals were negative until Jan 22, 1950 when an anaerobic gram negative bacillus was recovered and she was admitted to Stanford University hospitals

On examination the temperature was 99 5 F rectally and the pulse rate was 90 per minute The heart was slightly enlarged and there were signs of aortic insufficiency *and mitral stenosis* The spleen was palpable No petechiae were seen Laboratory investigation revealed a hemoglobin value of 12 0 gm per 100 ml, red blood cell count of 4 050 000 per cubic millimeter and a total leukocyte count of 5,200 per cubic millimeter The erythrocyte sedimentation rate (Westergren) was 20 mm per hour The urine was normal Anaerobic gram negative bacilli of the genus Bacteroides were isolated from the blood The organism was inhibited by 1 0 γ of terramycin per milliliter and 10 γ of streptomycin per milliliter It grew in the presence of 1 0 unit of penicillin per milliliter

Terramycin therapy was begun on Feb 1, 1950, in a dose of 3 0 gm per day by mouth and continued at this level until March 10, 1950, when the dose was reduced to 2 0 gm per day The drug was discontinued on April 7, 1950 Total duration of treatment was 66 days, and the total dose of terramycin was 170 gm No toxic reaction of any kind referable to the administration of this large amount of terramycin was observed

Bacteroides bacilli were never again isolated from the blood after institution of this regimen The *erythrocyte sedimentation* rate was 4 mm per hour on Feb 24 A few conjunctival petechiae were seen during the first two weeks of treatment but not later

When last examined on Oct 1, 1950, twenty five weeks after the withdrawal of terramycin, the patient was well and without evidence of change in her cardiac signs or reduction of cardiac reserve The spleen was barely palpable The erythrocyte sedimentation rate (Westergren) was 4 mm per hour, and the blood was sterile

COMMENT

Generalized septic processes caused by Bacteroides are not common, and the most suitable antimicrobial agents for use in such infections have not been defined Penicillin and streptomycin have been believed to be of little value because of the high in vitro resistance of the organism to these substances[2] Successful therapeutic results associated with the use of sulfonamides[3] have been described There was recovery in a case of subacute bacterial endocarditis following the administration of sulfadiazine, streptomycin, and penicillin[4] Reports of the use of the newer antibiotics having broad antibacterial spectra have not come to my attention

In this case therapy with penicillin, followed by small doses of aureomycin, was ineffective The organism isolated from the blood was inhibited by small amounts of terramycin, and the infection was permanently eradicated when large amounts of this drug were administered for two months The complete absence of gastrointestinal or other toxicity was noteworthy The further trial of terramycin in Bacteroides infection is obviously indicated

SUMMARY

A case of subacute bacterial endocarditis caused by a member of the genus Bacteroides is described The infection was eradicated by the administration of large amounts of terramycin for two months

INTESTINAL BLEEDING ASSOCIATED WITH ACETYLSALICYLIC ACID

Walter Modell, M D
and
Russel Patterson, M D, New York

Serious toxic reactions to the salicylates are rare in relation to the widespread use of this group of drugs In the present case it was possible to establish a causal relationship between prolonged intestinal bleeding and the taking of acetylsalicylic acid Hypoprothrombinemia has been reported after ingestion of the salicylates, and this has been ascribed to the bishydroxycoumarin-like action of the salicylates[1] There is a report of thrombopenia

with purpura and death after ingestion of salicylates,[2] but clear proof is lacking that they were the cause of the disease

REPORT OF A CASE

The patient, an intelligent, well developed, otherwise healthy male, 74, had continuous intestinal bleeding of undetermined origin for eight years The symptoms were anemia and weakness Blood was always found in the stools sometimes there was bright red streaking of the stools, frequently there was sufficient blood to color the water in the toilet bowl deeply, and when blood was not visible it could be detected by chemical tests When the anemia was first noted, in 1942, the patient was thoroughly examined in a medical center in another city Blood was found in the stools A polyp was found at the rectosigmoid junction and was cauterized The bleeding and anemia continued The patient was given iron, and the hemoglobin rose to normal

In 1944 and again in 1945 he was examined in two medical centers in this city At the first examination, nothing but the anemia and blood in the stools was found, at the second, a small hiatus hernia was found at the cardiac end of the stomach In view of the otherwise normal observations, it was conjectured that ulceration of the mucosa of the hernial sac might be the cause of the bleeding It is to be noted that in the aforementioned examinations there was a complete x ray examination of the gastrointestinal tract, as well as direct examinations of the visible portions of the rectum and colon through the sigmoidoscope There is no record of platelet counts or prothrombin time determinations There were no other observations that had any bearing on the problems presented For the relief of the pain of osteoarthritis of the right knee, the patient for many years had been in the habit of taking acetylsalicylic acid (aspirin) in amounts of approximately 3 Gm daily

When there was no iron therapy, the hemoglobin would sink to levels ranging from 7 to 9 Gm, with the red blood cell count between 3½ and 5 million Treatment consisted of ferrous sulfate, in oral doses of from 1 to 1.5 Gm three times daily The diet was rich in vitamins and meat When the patient was placed on such a regimen, the hemoglobin soon rose, despite the continued bleeding When iron therapy was discontinued, the hemoglobin would fall and the weakness would appear After a few such experiences, the patient was given iron therapy on a permanent basis, and he accepted the intestinal bleeding as a permanent feature of his life Such a plan was followed satisfactorily and the patient continued in his business without any difficulties arising from the intestinal bleeding.

On Aug 12, 1949, he had an acute intestinal obstruction due to carcinoma for which the bowel was resected It was now assumed that this had been the cause of the bleeding and had somehow escaped detection No metastases were found at operation. During the patient s hospital stay acute prostatic obstruction developed and a prostatectomy was performed The prothrombin time was normal and hemostasis was not difficult during the operations The patient received five postoperative transfusions There was no blood in his stools during the hospital stay On his discharge, on Nov 5, 1949, the blood cell count was normal, there was no blood in the stools and the bowel was normal by direct and x ray examinations The patient was free of all symptoms other than pain in his knee He had taken no acetysalicylic acid in the hospital but on his return home the pain in his knee caused him to take it again He was seen again on Nov 23, 1949 There was intense pallor, weakness, dyspnea, edema of the ankles, and gross blood in the stools The hemoglobin was 6 5 Gm The bowel was reexamined, but no cause for the bleeding was found The dose of iron was increased but the hemoglobin did not rise above 9 Gm

Then, for the first time in the history of bleeding and anemia acetylsalicylic acid was considered as a possible etiological factor in the bleeding This might be an instance of a bishydroxycoumarin like effect of therapeutic doses of a salicylate An experiment was designed to test this possibility and was outlined to the patient He was most cooperative He kept a precise and detailed daily protocol, including a list of the drugs he took the time and number of stools (usually about three a day), and the result of a gross examination of each stool Because of the prolonged course of the experiment, it was not feasible to keep the patient on the constant meatless diet that examinations of the stools for occult blood would have required

The use of acetylsalicylic acid was to be discontinued If the bleeding stopped, after a period of about two weeks this drug was to be resumed and continued until blood reappeared in the stools This procedure was to be repeated several times At critical points, determinations were to be made of hemoglobin, red blood cells, prothrombin time, and platelets Arrangements were made so that when blood appeared in the stools these determinations could be made without delay The dose of iron remained constant throughout

The table summarizes the results About two to three days after the patient stopped taking acetylsalicylic acid, gross blood disappeared from the stools About two weeks after administration of the drug was resumed, blood was seen in the stools It will be noted in the table that there were three periods of intestinal bleeding, which correspond to ingestion of acetylsalicylic acid, and three periods without visible blood, which correspond to abstinence On June 2, 1950, there was no occult blood in the stools (this was the first negative determination for occult blood in eight years), hemoglobin was 13 5 Gm and iron therapy was discontinued The patient was without iron therapy for a significant period for the first time in eight years When he was last examined on Oct 28 1950, he appeared well and his hemoglobin was 13 7 Gm No blood had been observed in the stools since he had discontinued taking acetylsalicylic acid (April 10 1950) He received no medication for his joint pains preferring the pain to the problems attending the intestinal bleeding

Observations in Patient Studied

Dates *	Length of Period (Days)	Gross Blood in Stools	Hemoglobin (Gm)	Red Blood Cells (Millions)	Platelets (Thousands)	Prothrombin Time (Sec)
11/23—12 14 †	22	Present	6.5-9 0			
12/15—2/8 50	55	Absent	12.3	4 7		14

4/10—10 28	202	Absent	13 7	4 7	240	11 4

* Period covered November 1949—April 1950
† Acetylsalicylic acid given

Our data, unfortunately, only hint at a mechanism of the bleeding The hemoglobin and red blood count did not change significantly during the experimental period, but this is unquestionably due to the fact that acetylsalicylic acid ingestion was stopped and that the bleeding was not permitted to continue for more than a few days after it was discovered Before the experiment, the low hemoglobin and red blood cell count had developed after long periods of bleeding The prothrombin time was normal on all examinations, and it may be assumed that a bishydroxycoumarin-like action played no role in the bleeding There is the observation of a platelet count of 120,000 after a two week period of acetylsalicylic acid therapy, but there is another count of 215,000 after a similar period of administration of this drug One of the platelet counts when the drug was not taken was as high as 340,000, another was as low as 240,000 The possibility that the intestinal bleeding was associated with thrombopenia rests, therefore, on the single platelet count of 120,000

In only one report,[2] already mentioned, was thrombopenia ascribed to the salicylates It was a case of a patient with purpura and extensive hemorrhages, who had taken salicylates and who was not saved by splenectomy It was reasoned by the authors that, since in true idiopathic purpura splenectomy is usually effective, the failure in this case indicates that salicylate was the cause of the purpura While the thrombopenia is definite, the evidence for an etiological connection between it and salicylates is tenuous In the present case the acetylsalicylic acid is clearly the cause of the bleeding, but that it is also associated with thrombopenia is only suggested and not proved by the experiment.

[2] Rappoport A E. Nixon C. E. and Barker W A Fatal Secondary Toxic Thrombocytopenic Purpura Due to Sodium Salicylate Report of a Case J Lab & Clin. Med 30 916 (Nov) 1945

SUMMARY

A case of intestinal bleeding for eight years is described During the eight year period, a polyp, hiatus hernia, and carcinoma of the colon were discovered, and each, when found, was thought to be the cause of the bleeding It is demonstrated, however, that acetylsalicylic acid (aspirin), which the patient had prescribed for himself, was the etiological agent in this case

1300 York Ave

CONTROL OF PULMONARY EMBOLI BY INFERIOR VENA CAVA LIGATION

REPORT OF A CASE

Gerald H Pratt, M D , New York

Indications for a vena cava ligation to prevent thromboembolism are few, but when these conditions exist, the results of this type of surgery are dramatic and life-saving It is my belief that once a clot large enough to occlude the pulmonary artery is present in a vein, a mechanical block between that clot and lung should not be delayed [1] It is admitted that anticoagulants may prevent propagation of clots, but, in the light of our present knowledge, we do not know such therapy can dissolve a clot which has already been formed [2] If a clot is present, therefore, in the large vessels, i e , the upper femorals, iliac veins, or vena cava, only by a physicial block in the pathway of clot movement can possible death be prevented This type of therapy is not used alone or to the exclusion of anticoagulants — anticoagulant therapy is always used in addition The following history is an illustration of complications sometimes seen by those who specialize in this type of work The patient described also presents an example of how some patients with this disease have been maltreated in the past

REPORT OF A CASE

A white American man, aged 41, was working in Texas when, in 1949, sudden pain developed in his right leg That day he had pain in his chest and subsequently coughed up some bloody sputum He was hospitalized locally for three days with an asymptomatic course and no specific therapy, and he was then permitted to return to his work There was a recurrence of the pain in his leg immediately, and more coughing of blood An x-ray of his chest was then taken, which showed at least two areas of pulmonary infarction. The therapy, at that time, consisted of transporting the patient to an airport, putting him on an airplane, and sending him back to his home in New Jersey

On his arrival home, he was hospitalized at the local hospital, and the right superficial femoral vein was ligated. He was also given 200 mg of bishydroxycoumarin (dicumarol®), and his prothrombin time rose to 62 sec (control, 19) The next night, he had another pulmonary embolism, and the left superficial femoral vein was then ligated The following day, the prothrombin level continued elevated The next day, there were severe dyspnea, cyanosis, and pain in his chest with hemoptysis He was then referred to my care in New York On his admission to a hospital in New York, there was some edema of the right leg with pain in the right popliteal space He had dilated 'sentinel veins" [2a] over the right tibia, and there were cyanosis, extensive dyspnea, and a questionable Homan s sign The patient had to sit up to get his breath There was persistent tenderness, also, in the right lower quadrant of the abdomen, and the patient stated he had been constipated since he had left Texas four days before On urinalysis, there were some red blood cells found in the urine In New York the prothrombin level was still elevated to 54

The problem, then, was one of a patient having repeated pulmonary emboli, even with a high prothrombin level and after superficial femoral ligations The clots thus were very high, or in the femoral profunda system It was decided to ligate the inferior vena cava at once. At that time, his prothrombin level still was 52 Because of the pain in the right lower quadrant, it was elected to go through the peritoneum for the vena cava ligation The abdominal contents were displaced upward, the retroperitoneum incised just above the bifurcation of the aorta, and the vena cava dissected free and ligated in continuity with No 2 nonabsorbable surgical sutures (silk), three sutures being placed about ⅛ in (0 32 cm) apart A right lumbar sympathectomy was performed at the same time There was no palpable clot in the vena cava at the operation site Upon closing the retroperitoneum, the appendix was delivered, and gangrenous appendicitis, with localized peritonitis, was discovered. The appendix was removed, and the patient's abdomen was closed without drainage

The patient immediately improved, the chest signs responded to antibiotics, the swelling in the right leg subsided, thereafter, and the part was warm and he had no further trouble with that leg Each time the patient started to walk, however, he would have severe pain in his left leg and that foot would blanch and go into spasm Sympathetic nerve blocks would relax this spasm each time It was evident that he was having reflex arterial spasm in the left leg One week thereafter, because of continuation of the symptoms, a retroperitoneal left lumbar sympathectomy was performed There was no further trouble in either leg, and the patient made an uneventful recovery The pathological report showed acute suppurative appendicitis with multiple abscesses in the wall The patient's prothrombin level remained above normal for approximately five days It was then maintained with small doses of bishydroxycoumarin thereafter for a period of two more weeks

COMMENT

This patient's history is detailed because it points up many facts needing emphasis

1 The lack of understanding of this thromboembolism problem which exists in the general medical field is shown by the fact that this patient was sent back to work three days after an embolism to his lung, and later was sent on a long transcontinental trip after a second one without therapy

2 The subsequent events emphasize the inadequacy of superficial femoral ligation to prevent further pulmonary emboli where large clots already exist [3]

3 The extreme sensitivity of some patients to bishydroxycoumarin (dicumarol®) is demonstrated It proves that pulmonary emboli can occur if a large clot is already present, even with a persistently high anticoagulant therapeutic level (Causes for abnormal sensitivity to anticoagulants in this patient and in other patients are not discussed)

4 This case shows the development of acute appendicitis, which might readily have been missed by the usual retroperitoneal approach to the vena cava It emphasizes, again, the fact that any right lower quadrant pain in the abdomen, despite any other condition, must be considered to be caused by appendicitis until one has proved otherwise If the appendix is in situ, the proof should be by laparotomy

5 The control of multiple pulmonary emboli by vena cava ligation, when specifically indicated, is proved

6 The role of arterial spasm following major vessel occlusion is illustrated, as is its relief by sympathectomy on both the right and left sides [4] In retrospect, left lumbar sympathectomy should have been performed at the time of the vena cava ligation At the time of operation, however, with the pathological conditions present in the right leg only, it was thought that the extra operative time necessary to dissect out the left lumbar sympathetic chain was not indicated

7 The complexity of thromboembolism in certain instances is apparent

Flavored Tablets Crystalline Potassium Penicillin G (Buffered) 50 000 units Buffered with 0 3 gm calcium carbonate Rexall Drug Company, Los Angeles

Pyrilamine Maleate (Formerly Pyranisamine Maleate See New and Nonofficial Remedies 1951, p 13)

Tablets Pyrilamine Maleate 25 mg Paul B Elder Company, Bryan, Ohio

Sodium Ascorbate Injection U.S P (See New and Nonofficial Remedies 1951, p 432)

Solution Sodium Ascorbate 2 cc ampuls A solution containing the equivalent of 50 mg. of ascorbic acid as sodium ascorbate in each cubic centimeter 5 cc and 10 cc vials A solution containing the equivalent of 100 mg of ascorbic acid as sodium ascorbate in each cubic centimeter The Smith Dorsey Company, Lincoln, Neb

Dia Men-Sulfonamides (See New and Nonofficial Remedies 1951, p 101)

Suspension Bisulfon with Sodium Lactate 480 cc and 3 84 liter bottles A suspension containing 50 mg sulfadiazine and 50 mg sulfamerazine and 0 1 gm of sodium lactate in each cubic centimeter Veltex Company, Birmingham, Ala

Testosterone Propionate U.S P (See New and Nonofficial Remedies 1951, p 363)

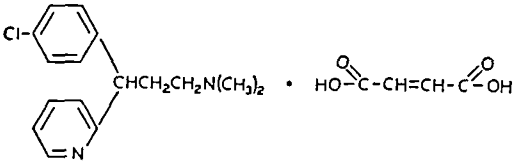
Solution Testosterone Propionate in Oil 10 cc vials A solution containing 50 mg. of testosterone propionate in each cubic centimeter Preserved with 0 5 per cent chlorobutanol Metropolitan Laboratories, Inc , Oyster Bay, N Y

Tetracaine Hydrochloride-U.S P (See New and Nonofficial Remedies 1951, p 40)

Pontocaine Hydrochloride Niphanoid® for Spinal Anesthesia Ampuls containing 15 mg of tetracaine hydrochloride Winthrop-Stearns Inc., New York.

Solution Pontocaine Hydrochloride for Caudal Anesthesia 100 cc bottles An isotonic solution containing 1.5 mg. of tetracaine hydrochloride in each cubic centimeter Winthrop Stearns, Inc New York

Chlorprophenpyridamine Maleate —Chlor-Trimeton Maleate (Schering) —$C_{16}H_{19}ClN_2$ $C_4H_4O_4$ —M W 390 86 —1-(*p*-Chloro phenyl) 1-(2 pyridyl) 3-dimethylaminopropane maleate —The structural formula of chlorprophenpyridamine maleate may be represented as follows



Actions and Uses —Chlorprophenpyridamine maleate has good therapeutic efficacy and low incidence of side effects Its low dosage does not appear to give it any particular therapeutic advantage over other antihistamines

Dosage —The average adult dose is 2 to 4 mg

Tests and Standards —

Physical Properties Chlorprophenpyridamine maleate is a white crystalline solid which melts between 130 0 and 135 One part of chlorphenpyridamine maleate is soluble in 3 4 parts of water in 10 parts of alcohol and in 10 parts of chloroform and is slightly soluble in benzene and ether The pH of a 1% solution is about 4 8

Identity Tests Dip a clean copper wire in a paste made by mixing about 50 mg of chlorprophenpyridamine maleate with a few drops of water and hold it in the nonluminous portion of the flame of a Bunsen burner the flame turns green *(presence of chlorine and distinction from prophenpyridamine)*

Dissolve about 0 5 gm of chlorprophenpyridamine maleate in 10 ml of water Make the solution alkaline with sodium hydroxide T S and extract the liberated base with 20 ml of chloroform Add 20 ml of a saturated solution of picric acid in alcohol (about 60 mg /ml of alcohol) previously heated to 65 Digest the reaction mixture at 65 for about 20 min add 20 ml of alcohol and keep at 65 for about 10 min longer A fine yellow crystalline precipitate forms Filter the mixture and dry the crystals in a vacuum for 4 hours and then at 105 for 4 hours the yellow crystalline picrate obtained melts between 197 and 200

A 0 003 per cent solution prepared as described later in the assay for chlorprophenpyridamine maleate exhibits an ultraviolet absorption maximum at 2 620 A [specific absorbancy E(1% 1 cm) is 143 ± 3] an inflection at about 2 680 A and a minimum at about 2 430 A

Purity Tests Dissolve about 0 3 gm of chlorprophenpyridamine maleate in 2 ml of alcohol add 5 drops of chloroform and 0 5 ml of 50% potassium hydroxide and heat a red color develops but no odor of isonitriles *(absence of primary amines)*

Dry about 1 gm of chlorprophenpyridamine maleate accurately weighed for 4 hours at 105 the loss in weight is not more than 0 5%

Ignite about 0.5 gm of chlorprophenpyridamine maleate accurately weighed the residue is not more than 0 15%

Assay (Chlorprophenpyridamine Maleate) Transfer 0.3 gm of chlorprophenpyridamine maleate accurately weighed to a 100 ml volumetric flask and dilute to the mark with water Mix thoroughly and transfer 10 ml of the solution to another 100 ml volumetric flask Dilute to 100 ml with water mix well and transfer 10 ml of the solution to a third 100 ml volumetric flask and dilute to 100 ml with water The final solution (0 003%) exhibits an ultraviolet absorption maxmum at 2 620 A [specific absorbancy E(1% 1 cm) 143 ± 3]

(Nitrogen) Transfer about 0 15 gm of chlorprophenpyridamine maleate accurately weighed to a semi micro Kjeldahl flask and digest it for 4 hours with 7 ml of sulfuric acid 2 7 gm of potassium sulfate and 0.3 gm of mercuric oxide Dilute the clear solution to 15 ml with water make it alkaline with 40% sodium hydroxide and then add 10 ml of 40% sodium thiosulfate Distil the ammonia into 20 ml of 4% boric acid Using a mixed indicator (1 part of methyl red T S 5 parts of bromocresol green T S) titrate the liberated ammonia with 0 05 *N* sulfuric acid Each milliliter of 0 05 *N* sulfuric acid is equivalent to 0 0007004 gm of nitrogen and to 0 01954 gm of chlorprophenpyridamine maleate The amount of nitrogen present is not less than 7 0% nor more than 7 4% equivalent to not less than 97 5% nor more than 102.5% of chlorprophenpyridamine maleate

Dosage Forms of Chlorprophenpyridamine Maleate

TABLETS *Identity Tests* Dip a clean copper wire in a paste made by mixing about 0 1 gm. of the powdered tablets with a few drops of water and hold it in the nonluminous portion of the flame of a Bunsen burner the flame turns green *(presence of chlorine and distinction from prophenpyridamine)*

Crush 75 tablets suspend the powder in 40 ml of water make the suspension alkaline with sodium hydroxide T S and extract the liberated base with 20 ml of chloroform Proceed as directed in the identity tests for chlorprophenpyridamine maleate starting with Add 20 ml of a saturated solution of picric acid in alcohol

Assay (Chlorprophenpyridamine Maleate) Weigh 20 tablets and grind them Accurately weigh the equivalent of 0 004 gm. of chlorprophenpyridamine maleate transfer it to a 100 ml volumetric flask and dilute to the mark with water Mix thoroughly filter the mixture through a dry filter paper discarding the first 25 ml of filtrate and measure the optical density in a 1 cm quartz cell with a spectrophotometer at 2 620 A Calculate the amount of chlorprophenpyridamine maleate from the specific absorbancy E (1% 1 cm.) = 143 ± 3 The amount of chlorprophenpyridamine maleate present is not less than 90 0% nor more than 110 0% of the labeled amount

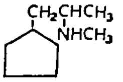
SYRUP *Identity Tests* Make 200 ml of the syrup alkaline with sodium hydroxide T S and extract the liberated base with three 20 ml portions of chloroform Combine the extracts filter them and evaporate the solvent Dip a clean copper wire in a paste made by mixing about 10 mg of the residue obtained with a drop of water and hold it in the nonluminous portion of the flame of a Bunsen burner the flame turns green *(presence of chlorine and distinction from prophenpyridamine)* With the rest of the residue proceed as directed in the identity tests in the monograph for Chlorprophenpyridamine Maleate starting with Add 20 ml of a saturated solution of picric acid in alcohol

Assay (Chlorprophenpyridamine Maleate) Evaporate 200 ml of syrup to approximately 150 ml on a steam bath Cool and extract the residue with two 100 ml portions of petroleum ether and discard the petroleum ether Bring the residual solution to a pH of 11 with 20% sodium hydroxide and saturate it with sodium chloride Extract the liberated base with seven 35 ml portions of petroleum ether Combine the extracts and wash them with two 5 ml portions of saturated sodium chloride (about 0 4 gm per milliliter of water) Combine the sodium chloride washes extract them with 10 ml of petroleum ether and add this extract to the main portion Evaporate the petroleum ether dissolve the residue in 25 ml of alcohol and add exactly 35 ml of 0 02 *N* sulfuric acid Back titrate with 0 02 *N* sodium hydroxide to an endpoint of *pH 6 8* using chlorophenol red or some other suitable indicator Each milliliter of 0 02 *N* sulfuric acid consumed is equivalent to 0 007817 gm of chlorprophenpyridamine maleate The amount of chlorprophenpyridamine present is not less than 90 0% nor more than 110 0% of the labeled amount.

Syrup Chlor Trimeton Maleate 473 cc bottles A flavored solution containing 0 5 mg of chlorprophenpyridamine in each cubic centimeter Schering Corporation, Bloomfield, N J

Tablets Chlor Trimeton Maleate 4 mg Schering Corporation, Bloomfield, N J

Cyclopentamine Hydrochloride —Clopane Hydrochloride (Lilly) —$C_9H_{19}N$ HCl —M W 177 72 —N,α Dimethylcyclopentaneethylamine hydrochloride —1-Cyclopentyl 2 methylaminopropane hydrochloride —The structural formula of cyclopentamine hydrochloride may be represented as follows



Actions and Uses —Cyclopentamine hydrochloride has the actions and uses of sympathomimetic amines It produces systemic pressor and local vasoconstrictor effects similar to those of ephedrine but, unlike ephedrine, produces only slight cerebral excitation Given orally it is more effective than ephedrine

The drug is administered by injection as an adjunct to other measures for maintaining blood pressure in operative procedures and in types of cardiovascular collapse where sympathomimetic drugs are not contraindicated It is also useful by topical application for the temporary relief of nasal congestion Its local vasoconstrictor action does not appreciably interfere with ciliary movements

Like other sympathomimetic agents, cyclopentamine hydrochloride should not be injected in patients with hyperthyroidism and should be used with caution in patients with hypertension Too frequent topical application should also be avoided to prevent such side effects as increased blood pressure nervousness, nausea and dizziness, particularly in patients susceptible to vasoconstrictor agents

Dosage —As a nasal decongestant, a 0 5% solution is applied topically by means of dropper, spray, or tampon Drops should be instilled with the head in the lateral head low position, when stinging is encountered the solution may be diluted with isotonic sodium chloride solution

As a pressor agent to maintain blood pressure during spinal anesthesia or surgery, a dose of 25 mg in 1 cc of solution is recommended It is injected intramuscularly just prior to administration of the anesthetic, with subsequent fractional doses as needed To combat a rapid fall in blood pressure the drug may be administered intravenously, but by this route the drug must be injected very slowly and in doses not exceeding 5 to 10 mg in order that the full effect of each dose may be determined

Tests and Standards —

Cyclopentamine hydrochloride is a white, odorless crystalline powder with a mild characteristic odor and a bitter taste It melts between 113 0 and 116 0 One part of cyclopentamine hydrochloride is soluble in 1 0 part of water in 1 8 parts of alcohol, in 23 8 parts of benzene and in 1.3 parts of chloroform and is slightly soluble in ether The pH of a 1% solution is about 6 2.

Identity Tests Add 0.5 gm of sodium nitrite to a solution of about 50 mg of cyclopentamine hydrochloride in 2 ml. of water and boil gently about 30 sec A turbidity may develop Cool and add about 1.5 ml of hydrochloric acid dropwise with additional cooling, if necessary a yellowish orange oily material separates. Add more hydrochloric acid dropwise with agitation until the oily layer disappears and a white precipitate forms Decant the supernatant liquid and add about 5 ml of water the precipitate dissolves *(presence of a secondary amine)*

Dissolve about 0 5 gm of cyclopentamine hydrochloride in 10 ml of water and add 0 5 ml of diluted nitric acid and 1 ml. of silver nitrate T S a white precipitate forms which dissolves in 10 ml. of ammonium hydroxide T S *(presence of chloride)*

Dissolve about 0 5 gm of cyclopentamine hydrochloride in 5 ml of diluted sulfuric acid and 20 ml of water and add about 1 gm of potassium cyanate. Heat on a steam bath for 1 hour cool and filter Dissolve the residue in 25 ml of boiling water filter while hot, cool and again filter Recrystallize the precipitate from boiling water and dry it at 80 for 4 hours the white crystals melt between 126 0 and 129 0

Purity Tests Dissolve about 0 3 gm. of cyclopentamine hydrochloride in 2 ml of water add 5 drops of chloroform 2 ml of alcohol and 0 5 ml of 50% potassium hydroxide and heat no odor of isonitriles is obtained *(absence of primary amines)*

Dry about 1 gm of cyclopentamine hydrochloride accurately weighed for 3 hours at 80° the loss in weight is not more than 0 4%

Ignite about 1 gm of cyclopentamine hydrochloride accurately weighed the residue is not more than 0 05%

Assay (Cyclopentamine Hydrochloride) Transfer about 0.25 gm of cyclopentamine hydrochloride accurately weighed to a 500 ml Kjeldahl flask Add 200 ml of water and a few boiling stones. Connect the flask with a suitable condenser and add 50 ml of 50% sodium hydroxide Distil the liberated base into a 250 ml Erlenmeyer flask containing exactly 40 ml of 0.05 *N* hydrochloric acid (equivalent to 100 ml of 0 02 *N* hydrochloric acid) keeping the tip of the condenser beneath the surface of the acid during the distillation. Collect at least 150 ml of distillate cool if necessary, and titrate the excess acid with 0 02 *N* sodium hydroxide using methyl red T S as an indicator Run a blank determination with the same quantities of reagents and in the same manner and make any necessary corrections Each milliliter of 0 02 *N* hydrochloric acid consumed is equivalent to 0 003554 gm of cyclopentamine hydrochloride The amount of cyclopentamine hydrochloride present is not less than 98 0% nor more than 102 0%

Dosage Forms of Cyclopentamine Hydrochloride

SOLUTION *Identity Tests* Make alkaline with sodium hydroxide T S a volume of solution equivalent to about 50 mg of cyclopentamine hydrochloride, extract the liberated base with 20 ml of ether and evaporate the ether on a steam bath Dissolve the residue in 2 ml of water and add 5 drops of diluted hydrochloric acid Add 0 5 gm of sodium nitrite and boil gently about 30 sec A turbidity may develop Proceed as directed in the identity tests in the monograph for Cyclopentamine Hydrochloride starting with, Cool and add about 1 5 ml of hydrochloric acid dropwise '

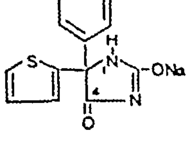
Make alkaline with sodium hydroxide T S a volume of solution equivalent to about 0.5 gm of cyclopentamine hydrochloride extract the liberated base with 35 ml of ether and evaporate the ether on a steam bath Dissolve the residue in 5 ml of diluted sulfuric acid and 20 ml of water and add about 1 gm. of potassium cyanate Proceed as directed in the identity tests in the monograph for Cyclopentamine Hydrochloride starting with Heat on a steam bath for 1 hour

Assay (Cyclopentamine Hydrochloride) Transfer a portion of the solution accurately measured equivalent to about 0.25 gm. of cyclopentamine hydrochloride to a 500 ml Kjeldahl flask Proceed as directed in the assay in monograph for Cyclopentamine Hydrochloride starting with Add 200 ml of water The amount of cyclopentamine hydrochloride present is not less than 95 0% nor more than 105 0% of the labeled amount

Solution Clopane Hydrochloride 1 cc ampuls A solution containing 25 mg of cyclopentamine hydrochloride in each cubic centimeter Eli Lilly & Company, Indianapolis

Topical Solution Clopane Hydrochloride 0.5% 30 cc 475 cc and 3 78 liter bottles An isotonic solution containing 5 mg of cyclopentamine hydrochloride in each cubic centimeter Preserved with phenylmercuric nitrate 1 50,000 Eli Lilly & Company, Indianapolis

Phethenylate Sodium—Thiantoin Sodium (Lilly)—Sodium 5-phenyl 5 (2 thienyl)hydantoinate — $C_{13}H_9N_2NaO_2S$ — M W 280 28—The structural formula for phethenylate sodium may be represented as follows



Actions and Uses—Phethenylate sodium is a hydantoin derivative with pronounced anticonvulsant activity It shares the antiepileptic action of other hydantoin compounds but differs in that it may be used to control petit mal as well as grand mal epilepsy and psychomotor seizures Hypertrophic gingivitis and dermatitis medicamentosa have been observed in a small percentage of cases treated These effects may require temporary withdrawal of the drug Development of vertigo, ataxia, or disequilibrium are indications for immediate cessation of therapy

The rare occurrence of severe blood dyscrasias such as leukopenia and thrombocytopenia should be anticipated by blood studies made periodically to permit early withdrawal of the drug if necessary Patients should be carefully watched for symptoms of agranulocytic angina or hemolytic anemia

Dosage—The dosage varies according to the needs of the patients, it should be adjusted to the minimum necessary to control seizures For the majority of adults, 0 13 gm two to four times daily is usually adequate Larger doses may sometimes be required The optimal dose is best determined by starting with 0 13 gm once or twice daily If toxic manifestations develop the dose should be reduced, supplemented by adding another drug or replaced completely by other agents indicated by the circumstances in each case Specific dosages for children cannot be given because they are determined according to clinical effects rather than weight Transition from anticonvulsant drugs, including phenobarbital, should be made gradually, with some overlapping in dosage to avoid increase in seizures when used in combination with phenobarbital or similar agents, smaller doses of both drugs are required

Tests and Standards—

Physical Properties Phethenylate sodium is a white odorless hygroscopic microcrystalline powder On exposure to air it gradually absorbs carbon dioxide with a corresponding liberation of 5-phenyl 5-thienyl hydantoin In aqueous solution it gradually dissociates One part of phethenylate sodium is soluble in 2 0 parts of water and in 5 0 parts of alcohol It is very slightly soluble in ether and is practically insoluble in benzene and chloroform The pH of a 1% solution is about 10 0

Identity Tests Heat gently about 1 gm. of phethenylate sodium in a platinum dish with 1 ml of sulfuric acid until no more fumes of sulfur trioxide are evolved The residue obtained responds to tests for sodium in *U S P XIV* p 724

To a dispersion of about 20 mg of phethenylate sodium in 3 ml of thiophene-free benzene add a solution of about 10 mg. of isatin in 1 ml of sulfuric acid and shake vigorously for about 1 min. the acid layer becomes green to dark green and turns blue after about 1 hour Run a blank on the reagents no color develops in the acid layer *(The test proves the presence of thiophene and distinguishes phethenylate sodium from diphenylhydantoin sodium)*

Dissolve about 0 5 gm of phethenylate sodium in 10 ml of water and add 5 ml of diluted hydrochloric acid a white precipitate forms Filter the mixture wash the precipitate well with cold water and dry it at 105 for 4 hours the phethenylate formed melts between 251 and 259°

Purity Tests Determine the heavy metals content (*U S P XIV* p 717) using 0.5 gm of phethenylate sodium in 25 ml of water no more turbidity develops than corresponds to 30 ppm of lead

Dry about 1 gm. of phethenylate sodium accurately weighed for 24 hours at 105 the loss in weight is not more than 1 5%

Assay (Phethenylate) Dissolve about 0.3 gm of phethenylate sodium accurately weighed in a mixture of 50 ml of water and 10 ml of diluted hydrochloric acid Extract the solution with one 100 ml portion and four 25 ml portions of ether Evaporate the combined ether extracts dry the residue at 105° for 4 hours, and weigh Each gram of phethenylate present is equivalent to 1 085 gm of phethenylate sodium The amount of phethenylate sodium present is not less than 97 0% nor more than 103 0%

(Nitrogen) Carry out a Kjeldahl or a semi-micro Kjeldahl determination as directed in *U S P XIV* p 740 The amount of nitrogen present is not less than 9 7% nor more than 10 3% equivalent to not less than 97 0% nor more than 103 0% of phethenylate sodium

Dosage Forms of Phethenylate Sodium

CAPSULES *Identity Tests* Ignite the contents of 2 capsules The residue obtained responds to tests for sodium in *U S P XIV* p 724

The phethenylate isolated in the assay described later melts between 251 and 259 and in the test for thiophene as described in the identity tests in the monograph for Phethenylate Sodium gives a stable brown green color in the acid layer after 30 min

Assay (Phethenylate) Accurately weigh the contents of 20 capsules and transfer them to a 250 ml beaker Place the emptied capsules in another beaker add sufficient alcohol to cover them completely and let them stand for 30 min with frequent stirring Filter the solution into the beaker containing the contents of the capsules and wash the capsules and filter well with alcohol Evaporate the liquid nearly to dryness on a steam bath and dissolve the residue in 45 ml of water and 5 ml of sodium hydroxide T.S Transfer the solution to a 200 ml volumetric flask dilute to the mark with water and mix thoroughly Filter the mixture through a dry filter paper discarding the first 25 ml of filtrate and transfer an aliquot equivalent to 0.3 gm of phethenylate sodium to a separatory funnel Dilute with water to make 50 ml and add 10 ml of diluted hydrochloric acid Extract the solution with one 100 ml and four 25 ml portions of ether Evaporate the combined ether extracts dry the residue at 105 for 4 hours and weigh Each gram of phethenylate is equivalent to 1 085 gm of phethenylate sodium The amount of phethenylate sodium present is not less than 93 0% nor more than 107 0% of the labeled amount

Pulvules Thiantoin Sodium 0 13 gm and 0 26 gm Eli Lilly & Company Indianapolis

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

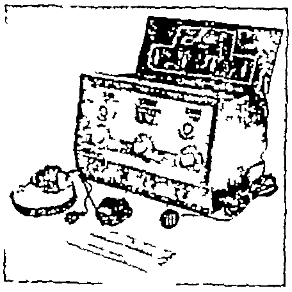
The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports

RALPH E DE FOREST, M D , *Secretary*

MAICO AUDIOMETER, MODEL H 1, ACCEPTED

Manufacturer The Maico Company, Inc , 21 North Third St , Minneapolis 1

The Maico Audiometer, Model H-1, is a pure tone audiometer for diagnostic purposes Unpacked, it measures 23 by 44 by 26 cm (9 1/16 by 17 1/8 by 10 5/16 in) and weighs 10 45 kg (23 lb) Packed for shipment it measures 36 by 50 by 36 cm (14 by 19½ by 14 in) and weighs 16 8 kg (37 lb) This shipping weight includes the following accessories 2 air receiver assemblies, 1 headband, 1 bone conductor assembly, 1 microphone assembly, 1 patient signal assembly, 100 audiogram charts, 1 dust cover, 1 operational manual, and 1 calculator for determining percentage of hearing loss The foreign shipping weight is 27 7 kg The device operates on 60 cycle alternating current at 110 to 120 volts but can be had also in forms using 25 cycle current and 220 to 240 volts It draws 40 watts of power



Maico Audiometer Model H 1

Evidence was obtained from an acceptable source that the device was of sound construction, that it performed as represented by the manufacturer, and that it satisfied the published minimum requirements of the Council for the acceptance of pure tone audiometers The Council on Physical Medicine and Rehabilitation voted to include the Maico Audiometer, Model H-1, in its list of accepted devices

ZENITH HEARING AID, MODEL "ROYAL," ACCEPTED

Manufacturer *Zenith Radio Corporation, 5801 West Dickens Ave , Chicago 39*

The Zenith Hearing Aid, Model 'Royal," is an electrical instrument conventional in shape, size, and general design The size, excluding clothing clips, is 77 by 59 by 22 mm The weight without batteries is 107 gm The batteries add 40 gm , and the cord and receiver weigh an additional 9 gm The A battery is a 1 25 volt mercury cell, the B battery is a 22 5 volt zinc-carbon battery

Zenith Hearing Aid Model Royal

Evidence from sources acceptable to the Council showed that this instrument was sound in construction and satisfactory in operation, and that it met the published minimum requirements of the Council The Council on Physical Medicine and Rehabilitation voted to include the Zenith Hearing Aid, Model Royal," in its list of accepted devices

TELEX HEARING AID, MODEL 400, ACCEPTED

Manufacturer Telex, Inc., Telex Park, Minneapolis 1

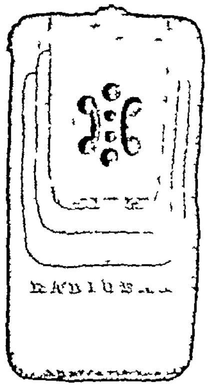
The Telex Hearing Aid, Model 400, is an electrical instrument of conventional design and construction except that it is intended for those who need a high acoustic gain for severe losses of hearing An added feature is a low drain adjustment" which reduces the drain on the B battery to above one half by sacrificing about 2 decibels of maximum power output The size, excluding switches, clips, etc , is 82 by 59 by 18 mm The weight without batteries, ear piece, or cord is 110 gm With batteries the weight is 177 gm

Evidence from sources acceptable to the Council indicated that this device was of good construction and performed as represented by the manufacturer The Council on Physical Medicine and Rehabilitation voted to include the Telex Hearing Aid, Model 400, in its list of accepted devices

RADIOEAR HEARING AID, MODEL 72, ACCEPTED

Manufacturer E A Myers & Sons, 306 Beverly Rd , Mount Lebanon, Pittsburgh 16

The Radioear Hearing Aid, Model 72, is a conventional electric hearing aid distinguished by especially high acoustic output with low distortion, a magnetic microphone, an inductive pickup ('Phonemaster) for use in telephoning, and certain internal and external arrangements for securing tone control Without clothing clip it measures 114 by 63 by 27 mm Without batteries it weighs 162 gm , with them it weighs 208 gm The cord and receiver together weigh 11 5 gm , and the bone conduction receiver with headband add 27 gm



Radioear Hearing Aid, Model 72

Evidence of good construction and satisfactory performance was obtained from sources acceptable to the Council The Council on Physical Medicine and Rehabilitation voted to include the Radioear Hearing Aid, Model 72, in its list of accepted devices

MILLER ELECTRO-SCALPEL, MODEL 10V, ACCEPTED

Manufacturer Miller Surgical Company, 2449 North Pulaski Rd , Chicago 39

The Miller Electro Scalpel, Model 10V, is a generator of high frequency electromagnetic radiation (frequency 3000 kilo cycles, corresponding to a wavelength of 100 meters) designed for use in electro-cutting and electro-coagulation in the office The firm states that no claim is made that this unit will stop all bleeders '

The device, unpacked, measures 24 (height) by 29 by 22 cm (9½ by 11⅜ by 8¾ in) and weighs 7 kg (16½ lb) Packed for shipment it measures 35 5 by 35 5 by 35 5 cm (14 by 14 by 14 in) and weighs 10 4 kg (23 lb) The shipping weight includes the following accessories ground cord and plate, foot switch and line cord, conization electrode, striping electrode, heavy duty needle, half-inch loop electrode, diamond loop electrode, straight spatula electrode, medium ball electrode, diagnostic cord, and two handles For operation, the apparatus requires a source of 60 cycle alternating current at 120 volts, and it draws 250 watts of power

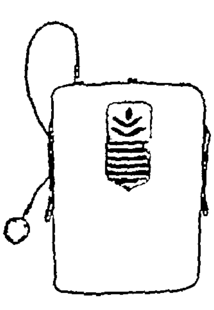
The Council obtained evidence indicating that the apparatus was well constructed and performed satisfactorily in office procedures when used as intended by the manufacturer The Council on Physical Medicine and Rehabilitation voted to include the Miller Electro Scalpel, Model 10V, in its list of accepted devices

AUDIVOX, MODEL SUPER 67, ACCEPTED

Manufacturer Audivox, Inc , 259 West 14 St , New York 11

The Audivox, Model Super 67, is a conventional electric hearing aid with magnetic receiver Excluding the clips and similar projections, the size is 87 by 63 by 22 mm The weight without batteries, receiver, or cord is 119 gm With batteries the weight is 166 gm

Evidence of satisfactory construction and operation was obtained from sources acceptable to the Council The Council on Physical Medicine and Rehabilitation voted to include the Audivox, Model Super 67, in its list of accepted devices



Audivox Hearing Aid Model Super 67

MEDICAL EDUCATION IN THE UNITED STATES AND CANADA

FIFTY-FIRST ANNUAL REPORT ON MEDICAL EDUCATION IN THE UNITED STATES AND CANADA BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

Introduction

This is the fifty-first annual report on medical education in the United States and Canada compiled by the Council on Medical Education and Hospitals of the American Medical Association. It covers the period from July 1, 1950, to June 30, 1951, and, as has been customary, presents data and statistics compiled from official sources on medical schools, students, graduates and other important topics. Several items in this year's report merit special attention.

The significant and continuing increase in the production of physicians, evident during recent years, continues. The 6,135 physicians graduated during 1950-1951 is the largest number ever graduated from American schools except for 1947, when, with termination of the accelerated program, several schools graduated more than one class. All records for student enrolment were again broken. More than 26,000 students were enrolled in the 79 medical and basic science schools of the United States, representing an increase of 1,088, or 4.1%, over the total reported for last year. The largest freshman class in the history of the approved schools, totalling 7,182 students is reported and estimates indicate that the 1951 freshman class will total about 7,400 students.

Significant progress is being made toward resolving the financial problems of the medical schools. Funds available to the schools during 1951-1952 will total approximately $109,600,000, which represents an increase of more than 36 million dollars in the past four years. In addition to the usual sources of funds, the schools this year are receiving grants from the National Fund for Medical Education and the American Medical Education Foundation. However, serious financial problems remain for a number of schools.

The outbreak of hostilities in Korea, attended by partial mobilization has posed new problems for the medical schools. The Joint Committee on Medical Education in Time of National Emergency, formed in June 1950, has been active in seeking solutions to these problems and has worked closely with many governmental agencies. Among the important activities of the Committee this year were preparation of recommendations to the National Security Resources Board, publication of a booklet entitled "Suggestions for Supplementing the Medical Curriculum in Time of National Emergency," and testimony in relation to Selective Service and Universal Military Training given before the Senate Armed Services Committee and the National Security Training Commission.

Field work by the Survey of Medical Education, conducted under the joint sponsorship of the Council on Medical Education and Hospitals and the Association of American Medical Colleges, was completed in June, 1951. The Committee for the Survey of Medical Education is now writing its report and hopes to have it ready for distribution by the spring of 1952.

Several trends indicating changes in the composition of the student body in medicine are revealed by the statistics with respect to the percentage of veterans and women entering medical school and by an analysis of the college records of the 1951 freshman class. A marked drop in the number of veterans, a slight reduction in the number of women and a doubling of the number of students with "C" averages in college are reported.

The section of the report dealing with postgraduate education discloses that there was a marked reduction in attendance at postgraduate courses during the past year.

The requirements of the various American Boards in the specialties usually included in this report will be presented this year in the Internship and Residency Number of THE JOURNAL which is scheduled for publication Sept. 29, 1951.

The data published in the Educational Number are obtained from official reports. The Council and THE JOURNAL express their appreciation to the officers of the medical schools, hospitals and other institutions and agencies whose cordial and valuable cooperation makes possible the compilation and presentation of this body of fundamental information which is consulted each year by many individuals, organizations, and governmental agencies interested in medical education in the United States and Canada

Medical Education and National Defense

The problem of formulating a sound program for the conduct of medical education during war time has been the subject of studies by the Council on Medical Education and Hospitals and the Association of American Medical Colleges since the end of World War II The outbreak of hostilities in Korea, with its attendant partial mobilization, posed new problems for the medical schools To the already insistent demand for an expansion of facilities and faculties, which would increase production of physicians for the civilian population, was added the necessity of supplying adequate medical manpower for the greatly expanded armed forces

As reported in last year's Educational Number, two days after the beginning of the Korean conflict, the Executive Council of the Association of American Medical Colleges and the Council on Medical Education and Hospitals formed a Joint Committee on Medical Education in Time of National Emergency This committee represents both organizations in discussions with representatives of government agencies and other groups, on problems in medical education related to the present emergency and other efforts to develop a program of national defense It also maintains liaison with other professional and educational organizations which are concerned with similar problems Members of the committee are Drs Stockton Kimball, Chairman, Joseph C Hinsey, A C Bachmeyer, Dean F Smiley, Mr John Stalnaker, George P Berry, Herman G Weiskotten, Harvey B Stone, Victor Johnson, Francis R Manlove, and Donald G Anderson, Secretary The liaison members are Drs David Ruhe, Harold S Diehl, B R Kirklin, and Mr C Joseph Stetler Valuable advice and assistance are being given the committee by consultants assigned to it by the Armed Services, the Public Health Service, the Office of Defense Mobilization, the Selective Service System, and the Veterans Administration

Four major actions of the Committee during the past year are of special importance

On Nov 1, 1950, the committee submitted a statement to the National Security Resources Board outlining certain recommendations which would aid in maintaining an adequate production of well qualified physicians during partial mobilization It was recommended that the premedical curriculum be not less than three academic years in length, that the medical course consist of four 12 month years and that the accelerated program, which proved so unsatisfactory during World War II, be avoided

In order to maintain an adequate supply of physicians and allied specialists, the Committee recommended that preprofessional and professional students be deferred until completion of their training Such men would then become available to the armed forces and other government services which require their special skills Medical schools should retain full power to select their students and should accept as many as can be accommodated without impairing the quality of training

All medical graduates should have 12 months or more of internship or of graduate or postgraduate study and an active program of resident training should be maintained It was recommended that to replenish and expand medical faculties, adequate provision be made for training those specialists in medicine and the basic sciences who are needed for teaching and research

It was also suggested that the medical curriculum be revised to give proper emphasis to subjects of importance to military medicine and other fields vital to national defense To facilitate this the Joint Committee appointed a subcommittee to study the curriculum and make recommendations This subcommittee consisted of Drs Stanley W Olson, Gaylord W Anderson, G M Dack, Roy R Grinker, Roger A Harvey, Andrew C Ivy, H Worley Kendell, Franklin C McLean, John P Marbarger, and Charles B Puestow, and the following consultants from government services Lt Col Louis B Arnoldi, United States Air Force, Dr W Palmer Dearing, United States Public Health Service, Capt R H Fletcher, United States Navy, and Col Floyd L Wergeland, United States Army

On Feb 10, 1951, the subcommittee's report entitled "Suggestions for Supplementing the Medical Curriculum in Time of National Emergency" was presented to the Joint Committee and shortly thereafter sent to each medical school The report outlines the subject matter to which the student should be introduced to provide him with a sound foundation for dealing with problems of civil defense and military medicine The subcommittee pointed out that most of this material can be satisfactorily covered by using examples drawn from military medicine and civilian disaster to illustrate scientific principles currently presented in the medical course It should, therefore, be possible to integrate this material into the present curriculum and thus avoid giving it in separate courses

On Jan 30, 1951, representatives of the Council and the Association of American Medical Colleges appeared before the subcommittee of the Senate Armed Services Committee in Washington to discuss the medical aspects of pending legislation for universal military training and service The Joint Committee's representatives emphasized the need for maintaining a continuing flow of students through the nation's institutions of higher learning to provide the specialized personnel essential for national defense and endorsed the program for the deferment of college students of high general competence as advocated by the Six Scientific Advisory Committees to the Selective Service System Under this program a pool of college students would be selected for continued training on the basis of their educational aptitude as determined by scores made on a general classification test and their previous academic records The Joint Committee expressed its approval of that section of the Senate bill which provided for competitive scholarships to be awarded on the basis of competence and need It was emphasized that students deferred from training and service should not be exempted from such training and service It was therefore recommended that this period of liability for training and service be extended by a period equal to their educational deferment and that they should ultimately serve the government in the special capacities for which they had been trained

On Aug 17, 1951, the Joint Committee appeared before the National Security Training Commission and presented essentially the same views that were expressed at the Senate hearings

The following sections summarize the policies of the Selective Service System and the Armed Forces, in effect at the time this report was prepared, which bear directly on the personnel involved in medical education

SELECTIVE SERVICE SYSTEM

Responsibility for the classification of registrants rests with the Selective Service Local Boards If an individual or his employer (cf college, medical school or hospital) has requested his deferment and he has been classified as available for military service, then the individual or his employer may, within 10 days of the mailing of the classification notice, file an appeal Should the appeal board sustain the classification, the registrant or his employer may, if there is a dissenting vote in the appeal board, file a written request with the local board to have the decision appealed to the President. If there is no dissenting vote, the State or National Director of Selective Service may appeal the case to the President

Premedical Students —Selective Service System Form 103 may now be used only for identifying those premedical students who have been definitely accepted for admission to medical school and for medical students who are continuing in medical school Premedical students who have not been accepted for admission to medical school and who are therefore not eligible for identification on SSS Form 103 are classed with all other college students and may seek deferment under the general provisions for student deferment.

In selecting college students for deferment, the Selective Service Local Boards may, at their own discretion, be guided by the score made by the student on the general classification test administered for the Selective Service System by the Educational Testing Service or by his previous record of academic performance At present a score of 70 or more on the classification test is considered as evidence of ability or promise sufficient to justify an individual's deferment for further education

In order to be eligible for deferment on the basis of class standing, a student must have maintained the following standing among the male members of his class freshman year, upper one-half, sophomore year, upper two-thirds, junior year, upper three-fourths

A graduate student, other than students of the healing arts who at present are covered separately by Local Board Memorandum No 7, may be deferred if he has been accepted for the next class commencing as a candidate for a graduate degreè and if in his last academic year as an undergraduate he stood among the upper one-half of the male members of his class or if he has scored 75 or better on the classification test

Medical Students —Medical students in good standing are eligible for deferment under the provisions of Local Board Memorandum No 7 and should be so identified by a SSS Form 103 This form should be filled out by the medical school for each student enrolled or definitely accepted for admission and be sent directly to the student's Local Board Copies are no longer to be sent to the National Headquarters of the Selective Service System Deferment may not be for longer than one year at a time but may be renewed and a new Form 103 must be filed, by the school, for each student each year The local boards have been advised, when considering students for deferment, to accept SSS Form 103 as evidence in support of their claim for occupational deferment

In October, 1950, Public Law 779, which provides for the registration, classification, and induction of certain medical, dental, and allied specialists, became effective All medical, dental, and allied specialists who had not yet reached the age of 50 at the time of registration were required to register and thereby became available for military service Registrants were divided into four categories signifying the order of induction

The first priority were those who had had ASTP or V-12 service or had been deferred by the Selective Service System prior to March 31, 1947, for the purpose of pursuing a course of instruction in their professions, and who had not had more than 90 days of service subsequent to the completion of, or release from, the educational program In Priority 2 were to be registered those who had participated in these educational programs but had had more than 90 days but not 21 months of service subsequent to the completion of, or release from, the educational program In Priority 3 would be registered those who had had no service at all since Sept 16, 1940, and in Priority 4 those who did not come under Priorities 1 or 2, and who served subsequent to Sept 16, 1940 The Act provided that such special registrants would be selected for induction first from those registered in Priority 1 and that each priority in turn would be exhausted of available men before the next priority could be used

Men in Priorities 1 and 2 were required to register on Oct. 16, 1950, those in Priorities 3 and 4 on Jan 15, 1951

The law states that the President may provide for the deferment of any person whose deferment is equitable and in the national interest He also is directed to provide for the annual deferment from training and service of premedical, predental and allied preprofessional students in numbers equal to those at present in attendance at colleges and universities

The President is also directed to establish a National Advisory Committee to advise the Selective Service System and aid State and local advisory boards in selecting the needed, medical, dental, and allied personnel

Up to the present time, inductions have been limited to Priority 1

First Year Interns —The Selective Service System has announced that it will not induct a man under Public Law 779 until he has had an opportunity to complete one year of internship training

Residents and Second-Year Interns —No statement of policy has been issued by the National Headquarters of the Selective Service System with respect to residents or second-year interns

The National Advisory Committee to the Selective Service System has indicated that almost all physicians in Priority 1 will be needed by the armed forces and has advised that they should apply for commissions before completion of their internships A few persons in these categories may be deferred for teaching, research, or public health service or because they are rendering essential service in isolated communities

The only persons in this group who can justifiably be recommended for deferment are those who are accepted for training in the scarcity specialties and whose services are required to meet essential needs of medical and dental schools or hospital services The specialties in which critical shortages exist are anesthesiology, physical medicine and rehabilitation, psychiatry, radiology, neurology, pathology, public health, orthopedic surgery, oral surgery, and the basic medical sciences Those few persons in these groups for whom deferment is necessary may be put in Class II-A on recommendation of the advisory groups

Persons in Priority 2, although not obligated for immediate service, should apply for commissions on completion of internships and residencies

Faculty Members—A majority of the faculty members of medical schools are under age 50 and therefore are required to register with the Selective Service System as required under Public Law 779 No policy has been announced by Selective Service on the granting of deferment to faculty members

However, the National Advisory Committee has recommended that, as a general policy, essential members of medical, dental and veterinary medical faculties be held in their teaching positions rather than released for military service This recommendation applies especially to men in the basic science departments and includes persons in Priorities 1 and 2 This policy is not a blanket recommendation for exemption from military service for all teachers Part-time teachers who devote only a small part of their time to teaching, and certain of the younger, full-time teachers in Priorities 1 and 2 will be expected to enter the military services

ARMED FORCES

At the present time a considerable number of premedical students, medical students, interns, residents and faculty are members of the reserve forces of the Army, Navy, Air Force and Marine Corps or of National Guard units Among premedical and medical students, a large number are enrolled as reserves in branches other than the medical departments On Aug 1, 1950, the Secretary of Defense announced a policy on delay in call to active duty for members of all civilian components of the Armed Forces possessing critical occupational skills This statement called attention to the fact that it is a basic function of the civilian components of the Armed Forces to be available for military service in time of emergency in keeping with the traditional policy of our nation to have a relatively small military force in being, supported by reserves and the National Guard It is recognized, however, that in an emergency, the national interest may dictate that the ordering to active duty of some reservists be delayed temporarily The statement goes on to establish the basic criteria on which requests for delay in call to active duty will be considered and evaluated Under these criteria, provision is made for delays in call-up of premedical students who have been definitely accepted for admission to medical schools, medical students, interns and essential residents and faculty members who are in the reserves The statement makes clear that delays in call to active duty will be made only on an individual basis and that they shall not be considered as a means of exempting persons indefinitely from military service

Each of the military departments is responsible for implementing these policies with respect to its own reserves and is issuing its own regulations These regulations are being reported from time to time in THE JOURNAL All the services have emphasized that requests for delay in call-up should not be submitted until orders to report for active duty have actually been received While each of the military departments has estabished an appeal board at the secretarial level which will reconsider individual cases in which the individual or his employer has additional facts or adequate reason to believe that an error was made by the first board, it is emphasized that unless delay in call-up orders are received prior to the reporting date, the person concerned must comply with his original orders

The Department of Defense announced in December, 1950, that, before a medical or dental reserve officer is called to active duty his name is to be sent to the Department of Defense which will request advice from the Armed Forces Medical Policy Council, Office of the Secretary of Defense, the Health Resources Advisory Committee of the Office of Defense Mobilization and the Advisory Committees to the Selective Service System The Military Departments will be guided by the information thus obtained in issuing orders for call to active duty This policy does not apply to organized reservists who have certified their availability for immediate call to duty Where an individual or his employer believes he should not be called to duty the case may be appealed to the Secretary of Defense

The National Fund for Medical Education and the American *Medical Education Foundation*

In the last two Educational Numbers reference has been made to the joint activities of several groups in exploring the possibility of establishing an organization to raise funds on a national scale from voluntary sources for the support of the medical schools In May, 1951, a public announcement was made of the establishment of the National Fund for Medical Education [1] This important new organization is sponsored by outstanding leaders in public affairs, business, industry, agriculture, labor, and higher education and by the American Medical Association and the Association of American Medical Colleges Its board of 66 distinguished trustees, drawn from all parts of the country, is headed by former President Herbert Hoover, as honorary chairman

The objective of the Fund is to raise annually from voluntary sources substantial sums to aid in the support of the nation's medical schools The Fund is concentrating on securing contributions from corporations and organized groups, which have to a large extent replaced individuals as the great potential sources of philanthropy

---

[1] The National Fund for Medical Education and the American Medical Education Foundation editorial J A M A. 146:258 259 (May 19) 1951

Earlier this year the American Medical Association sponsored the establishment of the American Medical Education Foundation as an instrument whereby individual physicians and state and county medical societies could make their contributions At the annual meeting of the sponsoring groups at which the announcement of the National Fund was made, it was also announced that the contributions received by the American Medical Education Foundation would be distributed to the medical schools through the National Fund

The National Fund has set a goal of 5 million dollars to be raised during 1951 The American Medical Education Foundation has agreed to raise one million of this amount from the medical profession

By July, 1951, the combined efforts of the Fund and the Foundation had raised a sufficient sum to make possible the awarding of initial grants of $15,000 to each of the 72 four-year medical schools and of $7,500 to each of the seven schools of the basic medical sciences in the United States As more funds are raised, additional grants to the schools will be made later in the year

While the initial grants may appear small, for many schools the grant will constitute the largest unrestricted sum that they will have available during the coming year Being unrestricted, the grants may be used by each school to support those activities that most urgently need additional funds Thus the real value of these grants to a school's educational program will be considerably greater than the sums involved might suggest

A unique and important feature of the operation of both the National Fund and the American Medical Education Foundation is that no portion of any contribution is used for administrative or operational expenses Every dollar contributed is distributed to the medical schools The overhead expenses of the National Fund are being met by special grants from a group of philanthropic foundations and those of the American Medical Education Foundation by the American Medical Association

In the section of this report on the financial support of medical schools evidence is presented to indicate that the gap between the funds available to the medical schools and their needs is being narrowed It may confidently be expected that the efforts of the Fund and the Foundation in the years immediately ahead will be instrumental in further reducing what remains of this gap

Survey of Medical Education

The survey of medical education which is being conducted by the Committee for the Survey of Medical Education under the sponsorship of the Council and the Association of American Medical Colleges ended its second year of field work in the spring of 1951 During the two-year period 41 schools were visited.

At the completion of this phase of the study the Committee, after carefully weighing all aspects of the problem decided that it would not be feasible to visit all medical schools as had been planned when the survey was initiated This decision was based on the recognition that the partial mobilization necessitated by the Korean conflict had resulted in increasing demands upon the medical schools from other sources and on the recognition that the schools individually and collectively are faced with urgent decisions on a number of fundamental, long term educational policies It was the opinion of the committee that it could render more service to the medical schools and the public by preparing an early report of its findings to date than by continuing its field work for another one or two years The Committee, therefore, decided to discontinue visits to the medical schools after June 1, 1951 and to address its full energy to the preparation of a report by the earliest possible date It is now hoped that the report will be published and ready for distribution by the spring of 1952

Early in 1951 the Committee recognized the possibility that it might not be feasible to visit all medical schools The schedule of schools selected for study was, therefore, adjusted to give an adequate cross section of the medical schools of the United States Since the purpose of the survey was to study problems that are basic to all medical schools rather than the peculiar problems of individual schools and since a representative cross section of schools has been studied, it is the committee's belief that the value of its report will not be materially affected by the lack of opportunity to visit all schools

The Subcommittee on Preprofessional Education, under the chairmanship of Dr Aura E Severinghaus of Columbia University, continues to work in coordination with the program of the Survey Committee During the past year the subcommittee made an intensive study of preprofessional education which included visits to approximately 100 colleges and universities which offer preprofessional training In November, 1950, this committee sponsored a three day conference at which a group of leaders from the liberal arts colleges met with the Subcommittee on Preprofessional Education and the Survey Committee for the purpose of discussing the principles and problems of preprofessional education The points of view and opinions expressed in this conference were summarized and utilized by the subcommittee in orienting its study of preprofessional education in the liberal arts colleges

A larger conference is being planned for the spring of 1952 to which representatives of the liberal arts colleges and medical schools will be invited for the purpose of discussing the final report of the subcommittee

Approved Medical Schools

The 72 medical schools in the United States which are approved by the Council on Medical Education and Hospitals are listed in Table 1, the 10 approved Canadian medical schools in Table 2, and the eight approved schools of the basic medical sciences in Table 3

The only change in this list since the publication of the 1950 Educational Number has been the addition of the University of Ottawa Faculty of Medicine to the list of approved Canadian medical schools The University of Ottawa offers a six year program of instruction It admitted its first students in the fall of 1945 and graduated its first class in May, 1951 In accordance with the

---

1 Includes figures for schools of the basic medical sciences

2. Medical schools graded as Class A from 1910-1929 as approved since 1929

The freshman year in most schools began in September or October At Kansas where the freshman year consists of two semesters and one summer session with vacations and periods of instruction staggered, half the freshmen began their studies in June, 1950, and half in September Utah admitted freshmen in June, and Tennessee admitted them quarterly Mississippi admitted two freshman classes one in July, 1950 and one in January, 1951

Schedules for the freshman class will be the same in 1951 as in 1950 at all schools except Utah, where the accelerated program has been discontinued Beginning in 1951, Utah will admit freshmen in September

Canadian medical schools followed regular schedules during the past year and will continue to do so for the coming year

Graduates

The last columns of Tables 1 and 2 give the number of graduates from each medical school in the United States and Canada, respectively, from July 1, 1950, to June 30, 1951 During this period, 6,135 physicians were graduated from medical schools in the United States This total includes two classes of graduates from Northwestern, which this year discontinued a required year of internship before the degree of doctor of medicine was awarded This is the largest number of physicians ever graduated from American medical schools in one year except for the year 1947, when, at the conclusion of the wartime accelerated program, several schools graduated more than one class

Table 4 shows the total number of Class A and approved medical schools in the United States and the total numbers of their students and graduates for each year since 1910 The form of this table continues the practice, inaugurated last year, of separating the statistics for Class A and approved schools from those for Class B and C schools In Table 5 are shown the statistics for Class B and C schools for the year 1910-1929 The A, B, C, classification of medical schools was discontinued by the Council in 1929, and since that time schools have been classed as approved or unapproved Since 1929, statistics have been published only for approved schools The present classification "Approved Medical School" is equivalent to the former Class A This fact should be borne in mind by those who desire to make comparative studies on the production of physicians

The schools with the largest number of graduates were Illinois 163, Jefferson 161, Tennessee 150, and Harvard 145 Northwestern University, as reported above, graduated two classes, a five year class of 143 students and a four year class of 136 students Only five schools had fewer than 50 graduates Utah 49, Syracuse 48, Woman's 39, Albany 39, and Vermont 38

The Canadian schools had 858 graduates Toronto, with 174, and Laval, with 141, had the largest number of graduates, while Ottawa, with 43, and Queen's, with 52, had the smallest numbers

Baccalaureate degrees (Table 6) were held by 4,630, or 75 5%, of the 6,135 students graduated from schools in the United States during 1950-1951 and by 509, or 59 3%, of the 858 students graduated by the Canadian schools in the same period

---

1 Includes figures for schools of the basic medical sciences

The estimated number of graduates for 1951-1952, based on enrolments reported for the senior class, is 6,177 The Canadian schools estimate that their graduates will total 806

Enrolments

During the past year all records were again broken for total enrolment and for the number of students admitted to approved medical schools in the United States Total enrolment in the 72 medical and seven basic science schools in the United States during 1950-1951 was 26,191, as compared with 25,103 for the preceding year This is an increase of 1,088, or 4 1%, in total enrolment The freshman class, totaling 7,182, is the largest in the history of the approved schools It is larger by 140, or 2 0%, than last year's freshman class Enrolment figures for the individual schools are given in Tables 1 and 3 Total enrolments for medical and basic science schools in the United States and Canada are recapitulated in Table 7

Total enrolment for the Canadian schools, including one basic science school, was 3,489, an increase of 211, or 6 4%, over the preceding year In addition, there were 395 premedical students and 194 students enrolled in a fifth (not intern) year These premedical and fifth year students are included in the "*total*" column of Table 2 but are not included in Table 7

There were 761 students in the required intern year in the United States and in Canada The total number of students enrolled in a required intern year in the United States is shown in Table 8 for each academic year since 1930-1931

In Table 9 the total enrolments in the various classes in the medical and basic science schools in the United States are recorded for each academic session since 1930-1931 It should be noted that prior to 1942-1943 the totals shown in Table 9 are somewhat higher than the sum of the figures for the various classes in a given year This discrepancy resulted from the inability of certain schools in the earlier years strictly to classify their students into conventional graded classes

In Table 10, the 72 medical schools of the United States are arranged in the order of the size of their student bodies The median enrolment was 340, and the average was 356

Responsibilities of Medical Schools for Other Students

The educational responsibilities of a medical school today cannot be properly measured or understood if attention is given only to the number of undergraduate medical students it enrolls Many medical schools provide instruction in whole or in part for large numbers of other students Only in recent years has this fact become appreciated, and even now it is not always fully grasped by those who seek to assess the contribution that a medical school makes to a university's total program of education

In Table 11 are listed by general categories the numbers of students other than regular medical students who received instruction during the last year under the auspices of the medical schools in the United States and Canada This year specific information was requested for the first time as to the number of dental, pharmacy, nursing, and technical students receiving instruction from medical school faculties In previous years some schools reported these students under the category of nonmedical students while other schools did not report them at all Attention was called in earlier reports to the fact that these differences in reporting resulted in totals that were incomplete It seems likely that no large groups of students have been omitted from this year's report and that the figures indicate with considerable accuracy the total student loads carried by the individual schools

TABLE 9—*Students in the Medical and Basic Science Schools in the United States 1931-1951*

Students in the required intern year are not included

1950-1951	7 182	6 090	6 263	6 656	26 191

* Includes additional classes

For all medical schools in the United States the number of students other than regular undergraduate medical students for whom the schools assumed responsibility totaled 57,262 The total enrolment of undergraduate medical students was 26,191 These figures make it clear that undergraduate medical students constitute less than one-third of the total number of students receiving instruction from the medical schools It must, of course, be recognized that the additional students in several of the categories reported in Table 11 did not receive full-time instruction comparable to that provided medical students However, students in several categories including physicians and other graduate students working for advanced degrees in the basic medical sciences, students in technical schools, interns and residents, physicians holding appointment as fellows, and in several schools dental students, did follow full-time courses of instruction provided by the faculties of the medical schools Students in these categories total 16,820

† Excludes 37 men and 2 women premedical students

Excludes 255 men and 27 women premedical students

increase during the past year in the number of additional students for which the medical schools provided instruction

In the category of physicians enrolled for advanced degrees, the number increased from 1,125 to 1,561 Other graduate students working for advanced degrees in the basic medical sciences jumped from 2,094 to 2,720 The total number of graduate students in the United States in these two categories was 4,281 which may be compared with the total of 3,219 last year and the highest prewar total of 1,167, for evidence of the continuing increase in the number of persons pursuing graduate study in the medical sciences

TABLE 13—*Women in Medicine in the United States*

Year	Women Students	Percentage of All Students	Women Graduates	Percentage of All Graduates
1905	1 073	4.1	210	4.0

---

* Includes additional classes

TABLE 14—*Enrolment by Classes of Veterans and Non Veterans in the Medical and Basic Science Schools in the United States, 1950 1951*

	Men Veterans	Other Men	Total Men	Women Veterans	Other Women	Total Women	Total Men and Women
Freshmen	2,852	3,954	6,806	15	361	376	7 182
Sophomores	3 694	2,626	6,320	18	352	370	6 690
Juniors	3,966	1,933	5,899	16	348	364	6 263
Seniors	3,942	1 660	5 602	25	429	454	6 056
Totals	14 454	10 173	24 627	74	1 490	1,564	26 191

The 17,654 physicians enrolled in refresher or continuation courses represented no significant change from the total of 17,930 reported last year Likewise, the total of 1,152 physicians enrolled in formal basic science courses in preparation for specialty board certification differed only slightly from the total of 1,087 for the previous year Physicians holding appointments as fellows also increased only slightly from 1,135 to 1,238

In Canada the total number of additional students during the past year was 3,225 When the categories of students that were reported this year for the first time are excluded, the total is 2,271, a definite increase over the total of 1,420 reported in the previous year

TABLE 11 —*Other Students for Whom Medical Schools Were Responsible 1950-1951*

School	Part Time or Special Students Working Toward M D Degree	Physicians Enrolled for Advanced Degrees	Other Graduate Students Working for Degrees in Basic Medical Sciences	Dental Students Receiving Instruction from Medical School Faculty	Pharmacy Students Receiving Instruction from Medical School Faculty	Nursing Students Receiving Instruction from Medical School Faculty	Students in Technical Schools Receiving Instruction from Medical School Faculty	Nonmedical Students Taking Medical Courses	Physicians Enrolled in Refresher or Continuation Courses	Physicians Enrolled in Formal Basic Science Courses in Preparation for Specialty Board Certification	Physicians Holding Appointments as Follows	Interns for Whose Instruction & Supervision the Medical School was Primarily Responsible	Residents for Whose Instruction & Supervision the Medical School was Primarily Responsible	Totals

Excludes 255 men and 27 women premedical students

increase during the past year in the number of additional students for which the medical schools provided instruction

In the category of physicians enrolled for advanced degrees, the number increased from 1,125 to 1,561 Other graduate students working for advanced degrees in the basic medical sciences jumped from 2,094 to 2,720 The total number of graduate students in the United States in these two categories was 4,281 which may be compared with the total of 3,219 last year and the highest prewar total of 1,167, for evidence of the continuing increase in the number of persons pursuing graduate study in the medical sciences

* Includes additional classes

TABLE 14 —*Enrolment by Classes of Veterans and Non Veterans in the Medical and Basic Science Schools in the United States, 1950 1951*

	Men Veterans	Other Men	Total Men	Women Veterans	Other Women	Total Women	Total Men and Women
Freshmen	2,852	3 954	6,806	15	361	376	7 182
Sophomores	3 694	2 626	6,320	18	352	370	6 690
Juniors	3,966	1 933	5 899	16	348	364	6,263
Seniors	3 942	1 660	5 602	25	429	454	6 056
Totals	14 454	10 173	24 627	74	1 490	1,564	26 191

The 17,654 physicians enrolled in refresher or continuation courses represented no significant change from the total of 17,930 reported last year Likewise, the total of 1,152 physicians enrolled in formal basic science courses in preparation for specialty board certification differed only slightly from the total of 1,087 for the previous year Physicians holding appointments as fellows also increased only slightly from 1,135 to 1,238

In Canada the total number of additional students during the past year was 3,225 When the categories of students that were reported this year for the first time are excluded, the total is 2,271, a definite increase over the total of 1,420 reported in the previous year

Distribution of Students by Sex

Classification by sex of all students enrolled in the medical and basic science schools of the United States and Canada for the academic year 1950-1951 is given in Table 12 Graduates of each school are similarly classified in the same table

Table 13 shows the number of women students and graduates and the percentage of women to all students and graduates for each year since 1905 Figures for the years 1905 through 1929 include students of Class A, B, and C schools, those for 1930 and subsequent years represent students of approved schools only

In 1950-1951, women in the medical and basic science schools of the United States totaled 1,564, or 5 9% of all students, while the Canadian schools reported 214 women students, or 6 1% of all students The total number of women students in schools of the United States is 242 less than for the preceding year Furthermore, due to the disproportionate increase in the number of male students, women now comprise only 5 9% of the total, as compared to 7 2% for the preceding year There has been a progressive decline in the total number of women students for the past five years The total of freshman women was 376, or 5 3% of the class, as compared with 387, or 5 5%, last year

The number of women graduates from United States medical schools decreased for the third year The total was 468, or 7 6% of all graduates, as compared with 595, or 10 7%, in 1949-1950

In Canada, women graduates numbered 63, or 7 3% of the total

Dartmouth, North Dakota and Jefferson had no women students and the Woman's Medical College no men students The number of schools with more than 30 women students declined from 15 to nine during the past academic year

Veterans in Medical Schools

Veterans enrolled in medical and basic science schools in the United States in 1950-1951 numbered 14,528, or 55 4% of all students The number of veterans decreased by 2,013, or 10 5%, from the preceding year Seventy-four of the veterans were women

In Table 14 the composition of the student body of medical and basic science schools in this country is recapitulated by classes Veterans comprised 39 9% of the freshman class, or 19% less than in last year's freshman class This is the smallest group of veterans to be enrolled in freshman classes since the end of the war The percentage of veterans in other classes were sophomores 55 4, juniors 63 5, and seniors 65 5

Negro Medical Students

The total number of Negro students enrolled in medical schools in the United States during 1950-1951 was 658, or 2 5% of all students These students were enrolled in 46 schools, with 275 enrolled at Howard University, 245 enrolled at Meharry Medical College, and 138 in other institutions There were 179 freshmen, 169 sophomores, 165 juniors, and 145 seniors

* Figures include two freshman classes

** Figures are for students in beginning premedical year

Geographic Source of Freshman Students

Table 15 shows the residence of students in the 1950-1951 freshman class of each medical and basic science school in the United States and Canada at the time of enrolment Individuals may change residence and often live in states other than those in which they were born Therefore, the home states given in this table are not necessarily either states of birth or of permanent residence Table 15 reports the residence of 950 freshmen in Canadian schools This figure differs somewhat from freshmen enrolment figures given in other tables because Table 15 employs the figures for the first class of premedical students at Queen's and Toronto, since these students are already registered in those schools

The trend toward exclusion of out-of-state students by state and municipally owned schools continued The number of publicly owned schools which did not admit nonresident students increased for the fifth successive year and now totals 17 as compared with 15 in 1950, 13 in 1949, 9 in 1948, 7 in 1947, and none in 1946 Three schools, one less than last year, admitted only one or two nonresidents

Twenty-three schools, one more than last year, admitted more nonresident than resident students

Of the total of 3,473 freshmen students admitted last year by state and municipal schools, 236, or 6.9%, were nonresidents, as compared with 249, or 7.2%, last year, 8.2% in 1948, and 17.4% in 1941-1942

Privately owned schools admitted a total of 3,709 students during the current year, of whom 1,951, or 52.6%, were nonresident This percentage did not differ significantly from the 53.1% reported last year and is nearly identical with the 52.9% reported in 1941-1942

In Table 16 are recapitulated the number of resident students, students from other states, students from the territories and outlying possessions of the United States, Canadian students, and foreign students enrolled in the 1950-1951 freshman class in each school in the United States and Canada

In Table 17 is shown the number of first year medical students per 100,000 population for each state For the nation as a whole there were 4.8 freshman medical students per 100,000 inhabitants The ratio is identical with last year's ratio This is accounted for by the fact that the increase in freshman enrolment was offset by the increase in the total population The 11 states without medical or basic science schools had an average of 4.3 first year students per 100,000 population while those states having such schools had an average of 4.9 freshmen per 100,000

* State with no medical school.

1 1950 Census of Population, Preliminary Counts PC 3 No 10 Feb 16 1951 Washington D C

There were 56 freshman students, 21 less than last year, from the United States' territories and possessions One of these students was enrolled in a Canadian school, the remainder in the United States Only four Canadians, 18 less than last year, were admitted by schools in the United States

Sixty-four other foreign students, seven more than last year, were enrolled in schools in the United States Of the 950 students entering Canadian schools, 51, three more than last year, came from the United States Canadian schools enroled 14 freshmen from other foreign countries

Required Internships

Only six schools in the United States and four in Canada require that their students complete an internship These schools are listed in Table 18 However, for many years more than 99% of all graduates have voluntarily served an internship and a majority have had additional hospital training before entering practice

In the last year, Northwestern University discontinued the required internship and Ottawa University joined the list of Canadian schools requiring it Duke University gives the M D degree at the end of the four year medical course but requires its students to sign a written agreement that they will spend two years training in a hospital or laboratory before beginning practice The other schools in this list withhold the M D degree until an internship has been completed Several schools permit substitution of a year of laboratory work for the internship

The number of United States students enroled in intern years required by their schools is given for each year since 1930-1931 in Table 8

University of Montreal Faculty of Medicine

Degree not withheld until internship completed.

One year of internship, as a prerequisite to licensure, is required by the licensing boards of 24 states, the District of Columbia, Alaska, Hawaii, Virgin Islands, and Puerto Rico The internship requirement was instituted during the past year by Colorado, Kansas and Guam, it was discontinued by Montana and the Canal Zone Those licensing boards which require an internship and the 15 boards which specify a rotating internship are indicated in Table 19

Licenses of candidates from schools which require an internship are withheld until completion of the internship by five states (Connecticut, Maryland, Missouri, Texas, and Virginia) whose laws do not otherwise require internships

Internships are required by certain states, in addition to those listed in Table 19 for graduates of schools outside the United States and Canada and for candidates seeking licensure by reciprocity or endorsement

Hospitals approved for intern training by the Council on Medical Education and Hospitals of the American Medical Association are generally acceptable in those states requiring an internship for licensure The current list of approved internships will be published in the Sept 29, *1951, issue of* THE JOURNAL

* Some other states require the internship for graduates of medical faculties abroad and from reciprocity or endorsement applicants

[1] Internship must be a rotating service

Preprofessional Requirements

The minimum requirement of the Council on Medical Education and Hospitals for admission to approved medical schools since 1918 has been two years of college training In 1938 the Council recommended that at least three years of college work be required of all candidates for admission All state licensing boards require that an applicant for licensure present evidence of having completed at least two years of premedical study in college California, the last state to institute this requirement, enacted a bill during the present year requiring two years of college work for present graduates and three years for graduates after Jan 1, 1955

Seventy-seven of the 79 medical and basic science schools in the United States require three or more years of premedical study Five of the Canadian schools have a similar requirement Nine schools, Georgetown, Chicago Medical School, Johns Hopkins, Tufts, New York Medical College, Cornell, Vanderbilt, Montreal, and Laval, require a bachelor's degree Georgetown, however, requires only three years of college work from veterans Cornell and Vanderbilt will accept students with three years of college work, provided their colleges will grant them a bachelor's degree on the successful completion of the first year of medical school

Of the freshmen who entered medical school in the United States during the past year, 5,249, or 73 1% had baccalaureate degrees, 408, or 5 7%, had attended college four years but had received no degree, 1,437, or 20 3%, had had three years of college work, and only 63, or 0 9%, had had only two years of college

College Record of 1950 Freshman Class

In last year's Educational Number, attention was called to the fact that, while medical schools have tended to raise their qualitative standards for admission in recent years, serious misconceptions exist in many quarters concerning the qualifications that a student must possess to gain admission to medical school Thus it was pointed out that statements had appeared in the public press to the effect that students who do not maintain a straight "A' average in college have little or no chance of being admitted to medical school To correct such misconceptions information was obtained and published in last year's report as to the number of students entering medical school in the year 1949-1950 whose college grade point average was less than 'B minus " Seventy-four schools were able to furnish this information Of these, 54 admitted a total of 592 students, or 9 1% of the freshmen in the 74 schools reporting, whose college averages were less than "B minus "

This year, in an attempt to define the situation more completely, schools were asked to report the number of freshmen entering medical school during the year 1950-1951 whose college averages were less than "B minus" and the number whose averages were higher than "B plus " Seventy of the 79 medical and basic science schools in the United States were able to provide this information Fifty-eight of the 70 schools admitted one or more students with college averages of less than "B minus " The highest number in any one school was 82 The total number of such students was 1,181, or 18 6%, of the freshmen in the 70 schools reporting

All 70 schools admitted students with college averages of better than "B plus " No school, however, reported that all its entering students had records better than "B plus " The total number of such students was 2,519, or 39 6%, of the freshmen in the 70 schools reporting

From this study it can be seen that approximately 40% of the students entering medical school last year had "A" averages, approximately 40% had "B" averages, and almost 20% had averages of "C" or lower in their college work

Official statistics compiled by the Association of American Medical Colleges from data supplied by all medical schools in the United States show that there was a drop of more than 2 000 in the total number of students that applied to the medical schools for admission to the class that entered medical school in the year 1950-1951, as compared with the preceding class [1] The drop was from 24,434 individuals applying for admission in 1949-1950 to 22,279 applying for the class entering in 1950-1951 As already noted, the number of students who actually enrolled in the 1950-1951 freshman class was 7,182 From these figures it can be computed that one out of every 3 11 applicants was successful in entering medical school In the preceding year the ratio was one out of every 3 47 applicants

It is well known that many of the 22,279 persons who sought to enter medical school last year were repeaters who had tried in one or more previous years to gain admission Thus the figure 22,279 cannot be taken as representing a single annual crop of college students who had just completed their premedical education Just how many repeaters are included among the 22,279 applicants is not known It is hoped that a study to obtain this important information will be made in the next few months with respect to those who sought to enter medical school in 1951-1952

---

[1] Stalnaker J M Study of Applicants for Admission to United States Medical Colleges—Classes Entering in *1950-1951 Medical Education* **20**: 1-6 (Jan) 1951

When taken together, the sharp increase in the number of students with "C" averages or less who were admitted to the 1950-1951 freshman class and the definite drop in the total number of applicants for that class would seem to indicate that the large pool of unusually able applicants with which most medical schools have been favored since the end of the war may be shrinking This trend is not surprising, since it has been generally recognized that the experience of recent years with respect to the number of and quality of applicants has been an abnormal one brought about by the large number of men from several college generations whose education was interrupted by the war and who on discharge from service more or less simultaneously resumed and completed their premedical education and sought admission to medical school It is likely, too, that this number was further augmented above the normal expectancy by students who would not have sought a professional education had not the benefits of the G I Bill of Rights been available

As the backlog of veterans is further reduced it may be expected that the number of applicants will be still further reduced until something approaching a stable plateau is reached The contemplated study of the number of applicants applying to medical school each year for the first time will be of great value in the early detection of this plateau

Despite the expected further reduction in the number of applicants and the further increases in enrolments that are expected, it is not likely that there will be an insufficient number of candidates with at least minimum qualifications to fill the available places in the freshman classes in the medical schools in the years ahead It is likely, however, that the schools will have to admit more students whose scholastic records are borderline from the point of view of offering promise of the capacity to do satisfactory work in medical school As a consequence the rate of failures in medical school which has dropped significantly in the last few years may be expected to rise

Those schools that restrict admissions to residents of a single state will probably have the greatest difficulty in finding suitable students to fill all their available places In fact, it may be predicted that some of these schools will have to relax their restrictions if they are to maintain the same quality of student body that they have enjoyed in recent years

The 1951 Freshman Class

The 1950 freshman class numbering 7,182 students was the largest ever enrolled in medical schools in the United States Figures submitted by the schools indicate that the 1951 freshman class will be even larger and will total close to 7,400 By June of this year the schools had already selected 7 157 students This number includes 1,639 male veterans (22 9%), 5,135 other men (71 8%) and 383 women (5 3%) Six of the women were veterans

Canadian medical schools up to June had enrolled 449 students, of whom 415 were men and 34 were women Total expected enrolment is 931

Major Developments in the Medical Schools

Each medical school was asked to describe briefly major new developments during the past year that might be of general interest The developments that were reported may be summarized under the headings of curricular changes, institutional affiliations organization and administration and miscellaneous

Thirteen schools instituted major changes in the curriculum of one or more years These schools included Alabama, Buffalo, Cornell, Louisville, Mississippi, Nebraska, North Dakota, Northwestern, Pennsylvania, South Carolina, St Louis, Utah, and Vermont As was the case with schools reporting changes last year almost all reported that the changes were effected to reduce the amount of didactic instruction in the clinical years, to make possible the earlier introduction of clinical subjects or to promote closer correlation or integration between departments

Under the heading of organization and administration, several schools reported the appointment of full-time faculty members in clinical departments that had previously been staffed entirely by part-time personnel Three schools organized departments of public health and preventive medicine as independent units for the first time or completely reorganized existing departments Louisville changed the name of its department to the department of community health, Virginia separated its department of preventive medicine and bacteriology to establish a department of social and environmental medicine and a department of microbiology North Dakota organized a department of preventive medicine and public health for the first time

Only a few new hospital affiliations were announced Temple established an affiliation with the Episcopal Hospital of Philadelphia, North Dakota with the Deaconess and St Michael's Hospitals in Grand Forks, N D , and South Dakota with the Veterans Administration Hospital at Sioux Falls, S D The State University College of Medicine at New York City expanded its services at Kings County Hospital, and Stanford added a pediatric service to its services at the San Francisco Hospital

In the following summary of construction programs, an effort has been made not to include in any category projects reported in the same category last year A number of schools reported that new medical school buildings proper or major additions to their existing buildings were under construction or were completed during the past year Schools reporting actual new construction were Buffalo, California at San Francisco, Indiana, Kansas, Meharry, North Carolina, Oklahoma, Southern California, South Dakota, and Virginia

Stanford and Indiana reported extensive remodeling or renovations of existing buildings

The following schools reported that additions to existing clinical facilities or the construction of new clinical facilities owned and operated by the schools were under construction California at San Francisco, University of Chicago, Indiana, Kansas, Minnesota, North Carolina, and Woman's

The following special building projects were reported as being under way or completed Stritch, a cancer research laboratory, Louisville, a virology laboratory, St Louis, a cancer research institute, North Dakota, research laboratories, Temple, a cancer research laboratory, and Utah, a radiobiology laboratory

The following schools in addition to projects that may be listed above, have indicated that they are in the process of planning the early construction of various units for which funds are available Some of these projects were reported in the same category last year Arkansas, State University of New York at New York, Louisiana, Mississippi, State University of New York at Syracuse, Oregon, South Carolina, Southwestern, Temple, Wayne, and West Virginia

Figures as to the actual or expected cost was submitted for only about one-third of the projects listed above The figures that were supplied this year for the first time totaled slightly more than 60 million dollars

The following miscellaneous developments appear to be of most general interest Cornell received a grant of $344,000 from the Commonwealth Fund for an experiment in the teaching and practice of comprehensive medicine The purpose of this new undertaking is to provide continuous medical care for a portion of the patients who visit the outpatient department of the New York Hospital and to make it possible for senior students to be associated with the same patients over a relatively long consecutive period of time Families as well as individuals will be cared for, and there will be an extension of services into the home

Buffalo received a grant of $300,000 a year from the State Department of Health for the operation of a chronic disease research institute The school also received a grant of $24,000 from the State Department of Health for a full time director of postgraduate education and the regional hospital programs sponsored by the school

Kansas received a grant of $30,000 a year for a minimum period of five years to support its program of postgraduate education and also received a grant of $100,000 to construct a continuation center

Utah has initiated a program of postgraduate medical education to serve the states of Utah, Nevada, Arizona, and Idaho

Oklahoma initiated a program of postgraduate medical education in cooperation with the State Medical Association

South Dakota was successful in sponsoring a new state-pound law which makes unclaimed dogs available to the medical school The school also sponsored the organization of the South Dakota Medical School Endowment Association which began an active campaign for funds during the past year

Boston reported that several of the heads and other members of its major clinical departments had formed a group practice organization as a nonprofit undertaking

Northwestern reported receipt of an endowment fund of $750,000 for its department of medicine The College of Medical Evangelists received a gift of $340,000, and Southern California, a gift of $350,000 Stritch reported that at a benefit dinner sponsored by Cardinal Stritch, for whom the school is named, a fund of approximately $250,000 was raised

Preparation for General Practice

The need for the continuing production of physicians who will have a primary interest in serving as family physicians or general practitioners continues to hold the attention of many medical schools Thus 54 schools in the United States report that they are sponsoring one or more programs designed to interest and prepare students for careers in general practice

Several schools report that their entire educational program has been designed with the primary purpose of preparing students adequately for general practice Special activities which are being conducted by the medical schools to stimulate interest in general practice include scholarship programs, home medical service and family advisor programs, courses or series of lectures on general practice by outstanding general practitioners and the organization of general medical clinics in which the conditions of general practice are simulated A number of schools attempt to develop the students interest through a counseling program Other schools have affiliated with groups of rural hospitals and have found that recent graduates have been attracted to practice in the communities in which these hospitals are located

Nineteen schools have established preceptorships whereby students work with general practitioners in outlying communities In nine schools the preceptorship is a required part of the undergraduate course In the other 10 it is elective The total number of students who served preceptorships last year was 713 In 14 schools the preceptorship comes during the summer following the third year or in the fourth year In the other schools it comes in the summer at the end of the second year or during the third year The duration of the preceptorship varies from one week to four months In five schools it is less than one month, in six schools it is one month to six weeks, and in the remaining eight schools it is two to three months

Twenty-five schools are sponsoring internships, and 19 are sponsoring residencies in their affiliated hospitals that are specifically designed for prospective general practitioners

Vacancies on Instructional Staffs

The number of vacant or newly created full time positions for the year 1951-1952 that the medical schools had been unable to fill up to June 1951 is somewhat lower than the comparable figures for the preceding two years The total for the present year for the schools in the United States is 235 In 1950 it was 281, and in 1949 it was 441

For the coming academic year, 20 schools, the same number as last year, report no unfilled positions Fifty-one schools had a total of 157 unfilled positions in the preclinical departments Twenty-seven schools reported a total of 78 unfilled positions in the clinical departments Last year there were 175 vacancies in preclinical departments and 104 in clinical departments

The number of unfilled positions are shown by departments in Table 20 There has been no significant change in the relative number of vacancies among the preclinical departments except in biochemistry, which last year had the second highest number of vacancies and this year has the lowest number

In the clinical departments vacancies in psychiatry and general surgery are relatively fewer than a year ago, and those in pediatrics are relatively more numerous Otherwise no significant changes are noted

In Canada seven medical schools reported no unfilled positions Four schools reported a total of 15 unfilled positions, of which 11 are in the preclinical departments and four in clinical departments

The budgets of the medical and basic science schools in the United States for the academic year 1951-1952 total approximately $74,350,000 This sum represents an increase of $6,850,000 over the figures reported for the previous year Since the number of schools reporting and the methods used by the schools in reporting their budgets are the same as for last year, no corrections to arrive at a net increase are necessary this year

This year's figures include the cost of plant maintenance and the cost of operating the library for all but two schools As was the case last year, all schools that carry a charge for general university administration in their budgets were able to subtract this item Such charges are not included in the $74,350,000 Also not included are a variety of items which total just over a million dollars for such activities as postgraduate education, scholarships, fellowships, public relations and fund raising that some schools reported separately from their regular budgets

The figure $74,350 000 does not include grants for research or for special teaching projects from outside agencies or any significant portion of the cost of operating the teaching hospitals affiliated with the medical schools It does include a total of approximately $3,250,000 that the medical schools will spend toward certain activities in their affiliated hospitals This sum, which is approximately $350,000 greater than in the previous year, is largely made up of salaries of professional and technical personnel on hospital staffs, the cost of operating special laboratories and in a few instances contributions to the operating budgets of hospitals and dispensaries used by the medical school for teaching purposes As in previous years no attempt has been made to compute the direct and frequently substantial contributions that a number of teaching hospitals make to the educational programs of their affiliated medical schools or to estimate the value of the services contributed by the unpaid members of the teaching staff who in a number of schools are still responsible for a major part of the instruction, especially in the clinical departments

It has already been noted under the section on major developments in the medical schools that during the past year the schools were engaged in constructing new facilities of various types and that the cost of only one third of these projects totaled more than 60 million dollars

The schools estimate that receipts from tuition fees during the coming year will total $16,300,000, or 21 9% of their budgets Last year tuition fees provided $15,200,000, or 22 5% of the budgets The number of schools unable to match student fees dollar for dollar in their basic budgets with funds from nonstudent sources remains at eight

Thirty medical schools, as compared to 24 last year, report budgets of over one million dollars for the coming academic year Four of these schools will have budgets of over two million Fourteen of the four year schools report budgets of less than $500,000 as compared with thirteen last year

The schools have estimated that during the academic year 1951-1952 they will receive from outside agencies a total of 31 million dollars in grants for research and $4,250,000 in grants for special teaching activities Funds received in these categories last year totaled 30 million dollars and $4,400,000, respectively All but one school received funds in both categories Among the four year schools the range in grants for research varied from $17,000 to $2,900,000 Seven schools received more than one million dollars in grants for research, and 12 other schools received between $500,000 and one million Among the four year schools special grants for teaching ranged from $24,000 to $211,000

Adding the research and special teaching grants that the medical schools expect to receive from outside agencies during the coming academic year to their budgets for this period gives a total of $109,600,000 that will be expended directly by the medical schools in the coming year in support of their total programs These programs include many activities in addition to the instruction of undergraduate students As remarked upon last year, Dr John E Deitrick, Director of the Survey of Medical Education, has emphasized that a modern medical school supports a broad program of instruction, research and service In the section of this report on the responsibilities of medical schools for other students, it is clearly shown that medical schools are providing directly for the educational needs of large numbers of other students in addition to undergraduate medical students Almost one-third of the total sum that will be expended by the medical schools next year is definitely earmarked for research and a smaller portion for the support of clinical activities Additional direct and indirect support of research and clinical services will undoubtedly be provided by the basic budgets of many schools although the actual amount cannot be estimated

Earlier this year the Surgeon General's Committee on Medical School Grants and Finances published its report of a study of the expenditures and needs of the medical schools during the academic year 1947-1948 In that year the committee reported the seventy-nine medical schools spent a total of $53,451,000 for maintaining basic operations This sum includes essentially all of the items represented in the budgets of the medical schools as reported in the Educational Number except for the expense of maintaining clinical facilities, research supported by university funds that is budgeted separately and a few minor activities that are relatively insignificant in terms of total expenditures In the same year the committee reported that the medical schools spent a total of $17,100 000 for separately budgeted research This sum was largely made up of research grants from outside agencies but also included some university funds The total expenditure during the academic year 1947-1948 for basic operations and for separately budgeted research was $70,551,000

After evaluating the unmet needs of the medical schools the Surgeon General's Committee concluded, "We estimate that the unmet needs pointed out above could be financed only by the expenditure of about 40 million dollars a year more than the medical schools are now spending for education and research This estimate is based on the amount cited to us by the medical schools This figure may be substantially discounted as representing the wishes and aspirations of those who have a sharp interest in securing additional funds Nevertheless, we have no doubt whatever that the additional annual income required by medical schools to perform their functions adequately is measured in tens of millions and not millions of dollars

"In considering this estimate it should be borne in mind that the medical schools could not absorb an additional 40 million dollars a year immediately This figure is a general measure of the level to which operating expenditures of medical schools should rise over a period of years"

As reported above, the total sum that the medical schools will have to expend for education and research during the year 1951-1952 is approximately $109,600,000 While the items covered by this estimate probably differ slightly from the items included by the Surgeon General's Committee in arriving at the figure of $70,551,000 as the total expenditure by the medical schools in 1947-1948 for basic operations and separately budgeted research the differences are minor except for the inclusion in the 1951-1952 estimate of the $3,250,000 that the schools will spend to support clinical facilities When this item is subtracted, the total sum available to the medical schools for the coming year becomes $106,350,000, a figure which can be compared with the 1947-1948 total of $70,551,000 for the purpose of estimating the progress that the medical schools have made in securing the additional financial support that the Surgeon General's Committee estimated as being needed It can be seen that the schools will have available in 1951-1952 approximately 36 million dollars more than they expended four years earlier during the period covered by the study of the Surgeon General's Committee

It is thus evident that in this four year period the goal of 40 million dollars has almost been met In attempting to calculate the extent to which this increase has relieved the financial stress on the medical schools, however, several points must be carefully weighed In the first place it must be recognized that not all medical schools have shared equally in this increase As pointed out in previous reports, tax supported schools on the whole have fared better in recent years than privately supported schools although a number of the latter have made very substantial gains during the period covered Part of the increase has been neutralized or nullified by the continuing rise in costs in general Some of the increase has been used to support new or expanded undertakings The estimates of the Surgeon General's Committee were based on what would be needed to support properly the programs of the medical schools at their 1947-1948 level Finally, it must be pointed out that approximately 14 million dollars of the 36 million increase is specifically earmarked for research and, therefore, is not available to the medical schools to bolster other phases of their programs in need of additional financial support

Even when allowance is made for these many factors, it is clear that very substantial progress has been made nationally in increasing the funds available to the medical schools and that the gap between available funds and needs, at least as forecast in 1948, has been greatly narrowed With the increasing public understanding of the needs of the medical schools and with the National Fund for Medical Education and the American Medical Education Foundation now giving active assistance, it does not seem too much to hope that this gap will be further narrowed with the passing of each succeeding year This statement should not be taken, however, to indicate that once the goal of 40 million dollars has been reached that all the needs of the medical schools will have been met for all time Expanding programs and continuing efforts to improve quality alone will lead to the need for upward revisions of earlier estimates If inflation and rising costs persist, they will, of course, accentuate the need for such revisions

None of these considerations, however, can take away from the substantial gain that has been made in securing better support for medical education and the clear fact that the needs of medical education are being recognized and are not going unheeded by the American people

In the period immediately after the war when medical schools were suddenly faced with the urgent need for immediate additional funds to maintain their programs, it was necessary to present the needs of the medical schools forcefully and dramatically This need inevitably led to well-intentioned but sometimes overly pessimistic public statements depicting the disaster that was impending for individual schools or for the medical schools as a group Unfortunately, some of the more extreme fears and predictions that were voiced in earlier years are still being echoed and at times by those who should be capable of calmer and more considered judgments There can be no question that some schools still have large unmet needs It is only proper, however, that the public be given an honest report of the progress that is being made In the long run such a policy would seem to be essential if the medical schools are to hold the public's confidence and support

Student Fees

Resident tuition fees in the 72 medical schools and the seven schools of the basic medical sciences in the United States for the academic year 1951-1952 will range from $97 to $867 except for one school which will charge a fee of $1,288 The median fee will be $660 as compared with $600 last year The average fee will be $596 as compared with $554 in 1950-1951

TABLE 21 —*Range of Annual Fees in Medical and Basic Science Schools in the United States and Canada*

	1950-1951 Number of Schools		1951-1952 Number of Schools

800 to 899	12		23	
1 000 and over			1	
Total	79	11	79	11

Twenty-eight schools have announced increases in fees ranging from $10 to $210 One school has increased its tuition fee $550

The average tuition fee now stands at 158% of the average tuition fee in 1939-1940 which was $378 As pointed out in the preceding section, however, tuition fees will provide only 21 9% of the cost of operating the medical schools during the forthcoming year

In Table 21 the 19 medical schools and schools of the basic medical sciences in the United States and Canada have been arranged in groups according to the tuition fees that will be charged resident students for the session 1951-1952 This table also gives comparable statistics for the year 1950-1951 The figures in this table represent one-fourth of the total tuition fee charged for the four years of the medical school course including minor charges such as those for matriculation, breakage, diploma, and graduation Thirty-six schools in the United States make an additional charge for nonresident students In 34 schools these charges range from $12 to $600 One school charges nonresident students an additional fee of $1,070 and another an additional fee of $2,130

Cost of Attending Medical School

In last year's Educational Number it was reported that estimates provided by the medical schools indicated that the minimum financial outlay experienced by a student in attending medical school for an academic year ranged from $567 to $2,252 with a median of $1 473 The average cost to a student for one year was reported to range from $800 to $2,500 with a median of $1,800

Although the increase in tuition fees and the rise in living costs during the last year have probably added to these figures, it seemed likely that the estimates prepared last year were still sufficiently current so as to make unnecessary a further inquiry this year with respect to the cost of attending medical school

An effort was made, however, to determine what percentage of students in the present first, second, and third year classes would be unable to finance their medical education without the aid of summer employment Thirty-nine medical schools in the United States submitted this information for their freshman classes 40 for their sophomore classes, and 34 for their junior classes

Of the 3,468 freshmen in the schools included in this study 1,663, or 47 9%, reported they could not continue to finance their medical education without the aid of summer employment For the sophomore class the figure was 1,585 of 3,220 students, or 49 2%, and for the junior class 1,237 of 2,958 students, or 41 8%

These figures indicate the high percentage of medical students who feel they must rely in part or in whole on their own earnings to meet the costs of their medical education Since it is known that some additional students who do not fall in the category of being unable to finance their medical education without summer work also seek employment to ease the financial burden on their families, the total figure of those who earn part or all of their medical education must be larger than that reported here

The above figures are of particular significance in discussions with respect to the adoption of an accelerated program of medical education or of a program of lengthened academic years with relatively short summer vacations In considering these problems, however, it would be desirable to have more precise studies of the amount of financial aid obtained by summer employment than could be attempted in this preliminary survey

Private and Governmental Medical Schools

The medical schools in the United States are listed in Table 22 according to the nature of their ownership There were no changes of ownership during the last year Forty-one schools are owned by private, nonprofit corporations exempt from federal taxation, 35 schools are owned by states and three by municipal governments

Enrolments in private schools during 1950-1951 numbered 14,191, or 54 2% of the total for the country The enrolment in state and municipal schools was 12,000 or 45 8%

Freshmen students in private schools numbered 3,709, or 51 7% of the total, and 3,473, or 48 3%, in the state and municipal schools

Statistics with respect to resident and nonresident student enrolment in state and municipal as compared with private schools are presented in the section on the geographic sources of freshman students

31 Medical College of Virginia
32 University of Virginia Department of Medicine
33 University of Washington School of Medicine
34 West Virginia University School of Medicine
35 University of Wisconsin Medical School

Municipally Owned

1 University of Louisville School of Medicine (Ky)
2 Wayne University College of Medicine (Mich)
3 University of Cincinnati College of Medicine (Ohio)

Budgets of state and municipal schools for 1951-1952 will total approximately $35,360,000, for the private schools $38,400,000

Tuition fees of state and municipal schools for residents of their own states will vary in 1951-1952 from $97 to $804 with a median of $405 For private schools tuition fees will range from $484 to $1,288 with a median of $800

New Medical Schools

Widespread interest in the development of new medical schools continued to be demonstrated during the past year In several states and Puerto Rico real progress was recorded in establishing new schools or in expanding schools of the basic medical sciences *to a full four-year* program

The University of Puerto Rico School of Medicine admitted its first freshman class in the fall of 1950 This school is planning the development of a four-year program During the coming academic year the school will have both a freshman and a sophomore class enrolled.

The University of California in Los Angeles *announced that it would admit its first freshman class in the fall of 1951*, two years earlier than originally planned

Mississippi is proceeding actively with the development of a four-year medical school at Jackson as authorized by the 1950 session of the Mississippi State Legislature Plans for the construction of the medical school building and hospital are nearing completion *It is hoped that ground can be broken in the fall of 1951 and that the first third year class will be enrolled* in the fall of 1953

The 1951 session of the West Virginia State Legislature authorized the expansion of the West Virginia University School of Medicine to a four-year program and passed a soft drink tax to finance the development and operation of the school The legislature empowered the governor to *decide the location of the school* In June, the governor *designated Morgantown as the site Plans for the medical school building* and teaching hospital are now being prepared

In New Jersey, the Medical College Commission, appointed by the governor in 1950, reported to the 1951 Legislature that a medical school should be established and recommended its location in New Brunswick It is reported that a special session of the New Jersey Legislature will be called this fall to make a definite decision on the establishment and location of the medical school and to provide for its financing

In Rhode Island, the legislature voted to establish a commission to study the feasibility of developing a medical school as part of the University of Rhode Island

In Massachusetts, the governor has appointed a committee to investigate the feasibility of establishing a medical school as a department of the University of Massachusetts

The 1951 Florida legislature passed an *act authorizing* the state to *make per capita payments to the first approved medical school* in Florida to begin operation *The possibility* of establishing a medical school is being seriously studied by the University of Miami

Expansion to a four year program is still under active study by the basic science school of the University of Missouri

Yeshiva University in New York City has announced its intention to develop a medical school and is at present engaged in raising the necessary funds

In Canada, the University of British Columbia School of Medicine admitted its first freshman class in the Fall of 1950 The school, which will be a four-year school, will enrol a freshman and sophomore class in the coming academic year

Foreign Medical Schools

In February, 1950, the Council on Medical Education and Hospitals and the Association of American Medical Colleges published their first list of foreign medical schools whose graduates they recommend be given consideration on the same basis as graduates of approved medical schools in the United States The purpose of this list is to serve as a guide for individuals, particularly those who are considering medical study abroad, and for medical organizations and institutions in the United States In developing the list, the two Councils have been aided by the Committee on Foreign Medical Credentials This Committee, established to advise the Council, consists of representatives from 19 private and governmental agencies concerned with problems of medical education and licensure and the problems of foreign physicians

Table 23 shows the schools now included in the list of foreign medical schools In the past 18 months, 11 schools have been added to the original 38 schools listed in February, 1950, to bring the total to 49

TABLE 23 —*Foreign Medical Schools*

On the basis of information presently available, the Council on Medical Education and Hospitals of the American Medical Association and the Executive Council of the Association of American Medical Colleges are of the opinion that medical institutions and medical organizations in the United States would be justified in considering current and past graduates of the following foreign medical schools on the same basis that they consider graduates of approved medical schools in the United States This list is not final and will be supplemented as information is compiled for other schools

Switzerland

The recommendation with respect to the following medical schools in Switzerland applies only to those graduates of Swiss medical schools who hold the Swiss Federal Diploma issued by the Federal Department of the Interior (Eidgenoissisches Departement Des Innern Departement Federal de L interieur) and obtainable only by Swiss citizens or who hold the Certificate of Medical Studies (Akademische Zeugnis Certificat d Etudes Medicales) which is issued by the Departments of Education of the cantonal government and which is awarded to those not citizens of Switzerland who complete a course of study and pass examinations equivalent to those taken by Swiss citizens in qualifying for the Swiss Federal Diploma

The recommendation does not apply to those holding only the M D degree from Swiss universities or those who have taken only faculty examinations and hold certificates other than the Swiss Federal Diploma of its equivalents the Akademische Zeugnis or Certificat d Etudes Medicales The M D degree in Switzerland is frequently awarded on the basis of a thesis written during as little as one year in residence Faculty diplomas may be issued to students who have not completed the full course of study and who have not passed the examinations required for the Swiss Federal Diploma or its equivalent

Officials of State Boards and of other organizations who are in doubt as to the nature of credentials presented by individual graduates of Swiss schools are urged to communicate with the Director of the Schweizerisches Gesundheitsamt Bern Switzerland

University of Basel Faculty of Medicine
(Universität Basel Medizinische Fakultät)

† Work for the medical degree of the University of London is offered at the following hospital medical schools

Charing Cross Hospital Medical School
Guy s Hospital Medical School
King s College Hospital Medical School
London Hospital Medical School
Middlesex Hospital Medical School
Royal Free Hospital School of Medicine
St Bartholomew s Hospital Medical School
St George s Hospital Medical School
St Mary s Hospital Medical School
St Thomas Hospital Medical School
University College Hospital Medical School
Westminster Hospital Medical School

It has been repeatedly emphasized that this list is a tentative one, to which other schools will be added when sufficient data has been compiled to justify their inclusion Absence of a school from the list does not therefore necessarily imply disapproval Hence it is the responsibility of individual institutions and organizations to decide whether to accept graduates of schools not included in this list

The list of foreign medical schools is now accepted, as a guide by the licensing boards in 23 states

Postgraduate and Continuation Courses for Physicians

The Council on Medical Education and Hospitals publishes semiannually in THE JOURNAL lists of postgraduate and continuation courses for physicians The opportunities presented in these listings include a wide variety of fields in clinical medicine and in the basic sciences These courses vary in length from a few days to a year or longer Some are concentrated full-time courses, others are part-time In the June 9, 1951, issue of THE JOURNAL, more than 800 courses covering the period from July 1, 1951, to Jan 15, 1952, are listed The medical schools take a prominent part in presenting this type of training State and county medical societies, hospitals, state and city boards of health, and special societies are also active in providing leadership in developing this aspect of medical education

With the exception of the formal basic science courses, these courses are not designed to prepare physicians for specialty board certification Some opportunities, however, are offered for review work in preparation for examination in the specialties

This section is devoted to an analysis of the courses offered during the period July 1, 1950, to June 30, 1951 Mention is also made of some of the recent developments in postgraduate education The statistical summaries are divided into three groups short review courses of less than five days, courses of five days' duration or longer and, lastly, a group including clinical conferences, graduate assemblies, study courses, and circuit courses Comparable figures are also given for previous years

RECENT DEVELOPMENTS

Postgraduate refresher courses are offered at the University of Arkansas School of Medicine as a joint effort of the State Medical Society, the Arkansas Academy of General Practice and the medical school The general plans call for a refresher course in one department or another every two weeks except during the summer months

A series of postgraduate short courses for medical officers will be given at five Army hospitals, the Armed Forces Institute of Pathology and the Medical Service Graduate School, Washington, D C, during the last six months of this year Eighteen courses will be given during this period Courses will utilize lectures, conferences, round-table discussions, and clinics Naval and Air Force medical officers have been invited to attend these courses This program is in keeping with the Army Career Management Plan, which provides a continuance of professional education throughout the military career of all Medical Corps and Dental Corps officers of the Army Medical Service Priority will be given to medical officers on active duty in the allotment of spaces, while medical officers not on active duty and civilian physicians are eligible to attend if space is available

A basic science course for specialty training is offered by the postgraduate division of the University of Illinois College of Medicine The course extends over a nine-month period and is designed to review the preclinical sciences against the student's background of undergraduate medical education and internship and to supplement the clinical experience obtained in residency training programs

An experiment in postgraduate education is being undertaken by the Indiana State Medical Association Programs are distributed once a month by private telephone wire to the 92 county societies throughout the state The county society arranges for a private line to its meeting place and for a public address system Listeners are furnished with brochures containing short biographies of the speakers, an outline of each address, reproductions of suitable visual aids, and space for notes

Beth Israel Hospital, Boston, is planning an intensive one-week course in practical clinical electrocardiography The course is designed for practicing physicians and beginners in electrocardiography who desire a short but practical introduction to the use of electrocardiograms in general practice

A postgraduate course in the early detection of cancer is being offered by Wayne University College of Medicine, Detroit The course is scheduled so that it may be taken for three quarters or so that any one quarter may be elected The course is designed to acquaint physicians with the means of diagnosis which are readily available to them

A feature of the intern and resident education program at the Atlantic City Hospital, New Jersey, is the daily clinical conference, at which distinguished teacher-clinicians from leading medical centers discuss diagnostic problems from the hospital wards and present didactic lectures on subjects of particular interest All licensed physicians are invited to attend these conferences

Postgraduate training in orthopedic surgery is being offered by the Hospital for Joint Diseases, New York City The curriculum will include a series of lectures, case demonstrations, and conferences on the clinical, diagnostic, therapeutic, pathologic, bacteriologic, chemical, and radiologic aspects of skeletal disease so integrated as to present a general review of the modern concept of the more important orthopedic diseases

The Memorial Center for Cancer and Allied Diseases, New York City, is offering refresher courses to physician-anesthetists for periods of one to six months Special emphasis is laid on anesthesia for head and neck surgery and for thoracic and radical pelvic surgery

New York Hospital and Cornell University Medical College sponsors a weekly practitioners conference at which programs of special interest to the general practitioner are arranged It is planned to have the conference in the form of clinics at which patients in the New York Hospital will be presented to illustrate the subject under discussion Round-table technic will be employed Emphasis will be placed on thorough case study, common errors in diagnosis, interpretation, and therapy Emphasis will also be placed on the functional pathology and origin of common symptoms

The Division of Postgraduate Medical Education of the University of Washington School of Medicine, Seattle, has scheduled postgraduate courses in hematology, clinical electrocardiography, psychiatry, and neurology in affiliation with the Washington State Medical Association and the State Department of Health

ANALYSIS OF COURSES OFFERED, 1950-1951

Courses of Less Than Five Days' Duration —Twenty-seven states and the District of Columbia provided courses of less than five days' duration for physicians desiring to continue professional study in or near their home communities There were 420 courses offered

Table 24 lists these states and the number of courses given in each state *Forty-four subjects were covered* Table 25 lists the subjects and also shows the attendance recorded The attendance numbered 7,438 More than 500 attended courses offered during the year in cardiovascular diseases, electrocardiography, general medicine, neurology and psychiatry, obstetrics and gynecology, and surgery The greatest number were enrolled for courses in general medicine

The courses varied in length from sessions of one hour or a series of five or more lectures to four and one-half days' full time and consisted of organized courses, clinics utilizing hospital patients, lectures and demonstrations Of the 420 courses reported, 54 were four-day courses, 96 were three-day courses, 66 were two-day courses, and 47 were given in one full day The remainder of the courses were reported by lectures, sessions, or hours The instructors were chosen from physicians practicing in the state in which the courses were offered as well as from out of state Medical school faculties participated in 296 courses The facilities used for conducting these courses, in addition to medical schools, included hospitals, clinics, and hotels and also combinations of these facilities

These offerings were held every month, the majority being given in January, February, March, April, September, and October In 13 instances they were arranged at the convenience of the applicant Six courses are

offered continuously Twenty were available for specialists only Fees ranged from $5 to $250 The majority of the fees were less than $50 In 14 instances no fee was charged

While the number of courses in this category increased from 161 in 1949-1950 to 420 in 1950-1951, the attendance did not increase correspondingly The attendance reported was more than 2,000 below that of the previous year

Courses of Five Days' Duration or Longer—In centers where ample clinical facilities are available, 1,067 graduate courses of more than five days' duration were offered in 20 states and the District of Columbia during 1950-1951 These states and the number of courses which were given in each state are listed in Table 26 There were 1,067 such courses, the greatest number were offered in Illinois and New York

These courses consisted of refresher courses of five or more days to intensive courses extending over one year Courses in 45 subjects were given Table 27 lists the subjects covered, the number of courses in each subject, and the total attendance for the courses in each subject In this type of training the total attendance was 14,890 More than 1,000 physicians attended courses in internal medicine, general medicine, and neurology and psychiatry, and over 500 were enrolled for courses in cardiovascular disease, electrocardiography, obstetrics and gynecology, ophthalmology and otolaryngology, pediatrics, pulmonary diseases, and surgery

The length of these courses varied from five days to one month for 523 courses There were 429 courses offered ranging in length from one to four months and 90 from five to 12 months There were four for three years, while the length of the course in 21 instances was arranged

Instruction was both didactic and clinical for 725 courses, didactic only for 112, and clinical only for 29 The remainder did not specify the type of instruction

Medical school facilities were used for 719 courses, hospitals for 181, and clinics for 30 In many instances, two or all three of these sources were used in presenting an individual course Hotel and other facilities were used for 23 courses The balance did not specify the facilities used.

The faculties of medical schools served as instructors in 733 courses Additional instructors were specialists in their field, chosen mainly from physicians residing within the state in which the course was given but including as well physicians from outside the state

Courses were offered during every month last year, and in 138 instances they were arranged to suit the convenience of physician-students In 17 instances the courses were given continuously There were 129 courses offered to specialists only Fees ranged from $10 to $1,200 For six courses no fee was charged

The reported attendance for the 1,067 courses given during 1950-1951 was 23,454 There were 79 courses reported cancelled By comparison with the previous year, the number of courses given decreased by 13 and the attendance by 633

One hundred and thirty-five agencies participated in the sponsoring of these courses, including 59 medical schools, 17 special societies, 8 state medical societies, 12 hospitals, 3 health departments, 4 county medical societies, 4 graduate schools of medicine, and the government agencies

Clinical Conferences, Graduate Assemblies, Study and Circuit Courses—In 21 states and the District of Columbia, 79 clinical conferences, graduate assemblies, and study and circuit courses were held during 1950-1951 This type of training varied in length from one-day sessions to two weeks for conferences, assemblies, and study courses In six states, circuit courses were held at various times throughout the states in four to 20 centers Contributing agencies were speakers' bureaus, medical schools, state and county medical societies, state health departments, and special societies Twenty-two subjects were covered The majority surveyed topics in general medicine and surgery Other subjects covered were cardiovascular disease, diabetes, corticotrophin (ACTH) and cortisone, obstetrics and gynecology, ophthalmology, and pediatrics Instruction was both didactic and clinical The facilities of hospitals, clinics, and medical schools were used Instructors included medical school faculties and physicians practicing in the state in which the training was given as well as from out of the state Courses were given in every month except May and August The fees ranged from $3 to $75 In 11 instances no fee was charged The attendance numbered 23,855

Summary—Some form of continuation study was provided during 1950-1951 in 30 states and the District of Columbia Table 28 summarizes for the three cate-

gories of courses, the number of courses given, the number for which attendance was reported and the total attendance together with comparable figures for the five previous years The total attendance for all three groups last year was 54,747 This represents a marked decrease in attendance as compared with the previous four years A number of factors may be responsible for this decrease The increased number of physicians entering military service during the past year undoubtedly removed a large group of potential students from among practicing physicians Further, it is likely that in many communities the responsibilities of those physicians remaining were so increased as to make it difficult for them to leave their practices for extended periods of study It is also probable that the drop in attendance reflects the fact that much of the demand for refresher courses by medical officers who served during World War II has been met Question should also be raised as to whether courses are being planned in a manner designed to arouse the interest and satisfy the needs of the physician Further study will be needed to determine the answer to this question and the trend of postgraduate education in the years ahead

APPROVED MEDICAL SCHOOLS IN THE UNITED STATES

ALABAMA

Birmingham

Medical College of Alabama.—Established in 1943 as a division of the University of Alabama. Located in Birmingham in 1944 In 1945 assumed title to Jefferson Hospital and Hillman Hospital Birmingham The Medical College of Alabama cares for all indigent patients of the county and city maintenance of which is paid to the university on a per diem basis by the county In 1943 the appropriation included $1 000 000 for the building of a new medical school which is now under construction and temporary quarters are now in the Jefferson-Hillman Hospital After completion of the new building which will house the basic sciences the current enrollment of 56 in the freshman class will be increased to 80 beginning in the fall of 1951 First instruction in the Medical College of Alabama started June 4 1945 with a junior class and this class was graduated in October 1946 On October 8 1945 the School of the Basic Medical Sciences on the University Campus established in 1920 and its faculty were absorbed into the new Medical College of Alabama. The medical college is coeducational. Minimum entrance requirements are three years of college work. Tuition is as follows for legal residents of Alabama $400 per academic year plus incidental fees of $30 Nonresidents of the state are charged an additional $250 each session The registration for the 1950-1951 session was 207 graduates 52 The last session began for the first and second years on Sept. 15 1950 and for the third and fourth years on Sept. 8 1950 The session ended for all four classes on June 2 1951 The next session for the first and second year classes will start Sept. 21 1951 and for the third and fourth year classes the session will begin Sept. 10 1951 All classes will end May 31 1952 The Dean is James J Durrett, M.D

ARKANSAS

Little Rock

University of Arkansas School of Medicine, 1209 McAlmont Street.—Organized in 1879 as the Medical Department of Arkansas Industrial University Present title in 1899 In 1911 the College of Physicians and Surgeons united with it and it became an integral part of the University of Arkansas. The first class was graduated in 1880 Clinical teaching was suspended in 1918 but resumed in 1923 Coeducational since organization The curriculum covers four sessions of nine months each. Entrance requirements are three years of collegiate work The B S. degree is conferred at the end of the second year The fees for the four years for residents of Arkansas are $380 a year enrollment is restricted to residents of Arkansas The registration for the 1950-1951 session was 340 graduates 82 The last session began Sept 25 1950 and ended June 11 1951 The next session will begin Sept. 24 1951 and will end June 16 1952 The Dean is Hayden C Nicholson M D

CALIFORNIA

Loma Linda Los Angeles

College of Medical Evangelists, Loma Linda Boyle and Michigan Avenues Los Angeles 33—Organized in 1909 The first class graduated in 1914 The laboratory departments are at Loma Linda the clinical departments at Los Angeles Coeducational since organization Three years of collegiate work are required for admission The freshman sophomore and junior years consist of nine month academic sessions and the senior year will have in addition to the nine month session a seven weeks clinical clerkship during the summer between the junior and senior years. A twelve month internship in an approved hospital is required The yearly tuitions including fees are respectively $1 287 00 $1,275 50 $1 291 25 $1,298 75 The registration for 1950-1951 was 374 graduates 81 The last session for freshman and sophomore students began on Sept 3 1950 and ended June 8 1951 respectively The junior session began on Sept 10 1950 and ended June 8 1951 The senior session began June 11 1950 and was completed June 8 1951 The next session for freshman and sophomore students will begin Sept. 2 1951 junior students Sept 8 1951 and senior students began June 10 1951 and will end June 6 1952 for the first three classes and June 7 1952 for seniors The President is Walter E. Macpherson M D Los Angeles The Dean is Harold Shryock M.D., Loma Linda and the Associate Dean is Varner J Johns M D Los Angeles

Los Angeles

University of Southern California School of Medicine 3518 University Avenue Zone 7—Organized in 1895 as the University of Southern California College of Medicine First class graduated in 1899 In 1908 it became the Los Angeles Medical Department of the University of California In 1909 the College of Physicians and Surgeons established in 1904 became the Medical Department of the University of Southern California Its activities were suspended in 1920 reorganized in May 1928 under present title Entrance requirements are three years of college work An internship is required for graduation Coeducational since organization. Annual fees amount to approximately $750 The registration for 1950-1951 was 272 graduates 67 The last session began Sept 18 1950 and ended June 16 1951 The next session will begin Sept. 17 1951 and will end June 14 1952 The Dean is Burrell O Raulston M D

San Francisco

University of California School of Medicine, Medical Center San Francisco 22.—Organized in 1864 as the Toland Medical College The first class graduated in 1864 In 1873 it became the Medical Department of the University of California In 1909 by legislative enactment the College of Medicine of the University of Southern California at Los Angeles became a clinical department but was changed to a graduate school in 1914 In 1915 the Hahnemann Medical College of the Pacific was merged and elective chairs in homeopathic materia medica and therapeutics were provided Coeducational since organization Three years of collegiate work are required for admission The work of the first year is given at Berkeley and that of the last three years at San Francisco The medical course consists of four academic years each containing two semesters of sixteen weeks each The fees are $320 per academic year Nonresidents are charged $250 additional each year The registration for the 1950-1951 session was 287 graduates 71 The last session began Sept 11 1950 and ended June 14 1951 The next class will begin Sept. 17 1951 and will end June 19 1952 The Dean is Francis Scott Smyth M D

Stanford University San Francisco

Burlington

University of Vermont College of Medicine Pearl Street College Park —Organized with complete course in 1822 Classes graduated in 1823 to 1836 inclusive when the school was suspended It was reorganized in 1853 and classes were graduated in 1854 and in all subsequent years. Coeducational since 1920 Three years of college work are required for admission For residents of Vermont the tuition fee averages $550 per session Nonresidents are charged an additional $150 each session A $25 fee is charged for the doctor s degree Registration for 1950-1951 was 168 graduates 38 The last session for freshmen sophomores and juniors began Sept. 9 1950 and ended June 10 1951 The last senior class began July 5 1950 and graduated June 10 1951 The present senior class began June 25 1951 the next freshman sophomore and junior classes will begin Sept 8 1951 and all classes will end June 15 1952 The Dean is William Eustis Brown M D

VIRGINIA

Charlottesville

University of Virginia Department of Medicine.—Organized in 1827 Classes were graduated in 1828 and in all subsequent years except 1865 Coeducational since the session of 1920-1921 Three years of college work are required for admission For residents of Virginia the tuition and other required fees are $459 per academic year for nonresidents, $859 The registration for 1950-1951 was 288 graduates 71 The last session began Sept. 18 1950 and ended June 11 1951 The next session will begin Sept 17 1951 and will end June 9 1952. The Dean is Vernon W Lippard M D

Richmond

Medical College of Virginia, Twelfth and Marshall Streets.—Organized in 1838 as the Medical Department of Hampden-Sydney College Present title was taken in 1854 In 1913 the University College of Medicine was merged. Coeducational since 1918 Classes were graduated in 1839 and in all subsequent years Three years of collegiate work as a minimum are required for admission Preference however is given to applicants with a baccalaureate degree Fees average $510 per academic year Nonresidents are charged an additional $325 each year The registration for 1950-1951 was 363 graduates 95 The last session began Sept. 11 1950 for second third and fourth year classes and ended June 5 1951 The last session for the first year class began Sept. 7 1950 and ended June 5 1951 The subsequent session will begin Sept. 6 1951 for the first year class and Sept 10 1951 for the second third and fourth year classes and will end June 3 1952. The Dean is John B Truslow M D The Associate Dean and Chairman of the Admissions Committee is Mr George W Bakeman

WASHINGTON

Seattle

University of Washington School of Medicine, Seattle 5—Established by the Legislature in 1945 and organized as one of the professional schools in the Division of Health Sciences of the University of Washington in 1946 The first class graduated in 1950 Coeducational The minimum requirement for admission is three years of collegiate work Tuition fees are $363 each year for residents of Washington and Alaska and $558 for nonresidents of these areas. Registration for 1950-1951 was 242 graduates 48 The first three classes were limited to 50 students but with the class entering in 1949 this number was raised to 75 The last session began Sept. 27 1950 and ended June 9 1951 The next session will begin Sept. 24 1951 and will end June 14 1952. The Dean is Edward L. Turner M D

WISCONSIN

Madison

University of Wisconsin Medical School 418 North Randall Avenue Zone 6.—Organized 1907 Gave only the first two years of the medical course until 1925 when the clinical years were added. Coeducational since organization The entrance requirement is three years of collegiate work Fees for the first second and third years $280 for the fourth year $190 per academic year for residents. An additional fee of $300 per year is charged nonresidents. Registration for 1950-1951 was 312 graduates 71 The last session for freshman sophomore and junior students began Sept. 18 1950 and ended June 15 1951 The last senior class began June 26 1950 and ended June 15 1951 Freshman sophomore and junior classes will begin Sept. 24 1951 and will end June 20 1952 The senior class began June 25 1951 and will end June 20 1952 The Dean is William S Middleton M D

Milwaukee

Marquette University School of Medicine, 561 North Fifteenth Street—Organized in December 1912 by the merger of the Milwaukee Medical College and the Wisconsin College of Physicians and Surgeons. Coeducational since organization Three years of collegiate work are required for admission. The fees are $750 per academic year The registration for the 1950-1951 session was 372 graduates 87 The last session began Sept. 25 1950 and ended June 3 1951 The last senior class began June 12 1950 and ended June 9 1951 The next session for freshman, sophomore and junior students will begin Sept 10 1951 and will end May 31 1952. The 1951 1952 session for seniors began June 11 1951 and will end June 7 1952 The Dean is John S Hirschboeck M D

APPROVED MEDICAL SCHOOLS IN CANADA

CANADA

Alberta

University of Alberta Faculty of Medicine, Edmonton.—Organized in 1913 Coeducational since organization. Has given complete medical course since 1924 New course—three years premedical four years of medicine—offered with the session 1947 1948 Tuition for the first and second years is $425 per session and for the third and fourth years is $450 per session The registration for 1950-1951 was 216 graduates 57 The last session began Sept 5 1950 and ended April 30 1951 The next regular session will begin Sept. 4 1951 and end April 30 1952 The Dean is John W Scott, M D

Manitoba

University of Manitoba Faculty of Medicine, Bannatyne Avenue, Winnipeg.—Organized in 1883 as Manitoba Medical College. First class graduated in 1886 and a class graduated each subsequent year The college transferred all its property to the University of Manitoba in 1919 and assumed the present title Coeducational since organization Matriculation requirements include three years of collegiate work in the faculty of arts and sciences of a recognized university The course extends over four years of eight months each and a hospital internship The fees average $445.25 yearly The registration for 1950-1951 was 294 graduates 67 The last session began Sept 11 1950 and ended May 15 1951 The next session will begin on Sept 17 1951 and will end on May 15 1952. The Dean is Lennox G Bell, M D

Nova Scotia

Dalhousie University Faculty of Medicine Morris Street Halifax.—Organized in 1867 Incorporated as the Halifax Medical College in 1875 Reorganized as an examining faculty separate from the Halifax Medical College in 1885 In 1911 in accordance with an agreement between the Governors of Dalhousie University and the Corporation of the Halifax Medical College the work of the latter institution was discontinued and a full teaching faculty was established by the university First class graduated in 1872. Coeducational since 1871 Requires for matriculation two years of arts The regular medical course covers four years and a hospital internship of one year approved by the medical faculty The fees average $410 yearly nonresidents $250 additional fee The last session for freshmen sophomores and juniors began Sept. 5 1950 and for seniors May 8 1950 all classes ended May 15 1951 The registration for 1950-1951 was 221 graduates 55 The next session for all classes will begin Sept. 5 1951 and will end May 13 1952 The Dean is H G Grant M D

Ontario

Queen s University Faculty of Medicine, Kingston—Organized in 1852 First class graduated in 1855 and a class graduated each subsequent year The course consists of six sessions of thirty teaching weeks the sixth session being devoted entirely to clinical work in the hospitals affiliated with the University The latter is not considered an internship Fees for each of the six years amounts to $413 75 The degrees awarded are M D C M Freshmen will be admitted annually Registration for 1950-1951 was 347, graduates 52 The last session began Sept. 18 1950 and ended May 12 1951 The next session will begin Sept 17 1951 and will end May 10 1952. The last Convocation was held June 2 1951 The Dean is G Harold Ettinger M D The Secretary of the Faculty of Medicine is H D McEwen Ph D

University of Ottawa Faculty of Medicine.—Organized in September 1945 The degree of M D is conferred after 1 year premedical studies 4 years medicine and 1 year of internship The minimum acadmic requirements for admission to the premedical year are the Ontario Grade XIII Honour Matriculation or equivalent certificates Students who have obtained their bachelor degree in arts or in science and who have completed the required courses in biology chemistry and physics may be admitted to the First Year of Medicine An internship is required for graduation The registration for 1950-1951 in the medical and premedical years was 250 graduates 43 The next session for the premedical year will begin on Sept 14 1951 and for first second third and fourth medical years on Sept 11 The session for the premedical year will end in May 1952 and for the medical years in June 1952 Students graduate in May The Dean is A L. Richard M D

University of Western Ontario Faculty of Medicine 346 South Street London.—Organized in 1881 as the Western University Faculty of Medicine First class graduated in 1883 and a class graduated each subsequent year Present title in 1923 The Faculty of Medicine has been under the control of the Board of Governors of the University of Western Ontario since 1913 Coeducational since 1913 The normal course of study covers two honor college years of nine months each and four years of nine months each in the Faculty of Medicine The total fees to residents of Canada for the last four years are $515 a year The registration for 1950-1951 was 243 graduates 61 The last session began Sept 11 1950 and ended May 24 1951 The next session begins Sept 10 1951 and ends May 22 1952 The Dean is J B Collip M D

University of Toronto Faculty of Medicine Toronto 5—Organized in 1843 as the Medical Faculty of King s College Abolished in 1853 Reestablished in 1887 In 1902 it absorbed Victoria University Medical Department and in 1903 it absorbed the Medical Faculty of Trinity University Coeducational since 1903 The degree of M D is conferred after 4 years in the study of medicine Admission to the medical course is gained following honour matriculation and after two years in the study of premedical requisites in the University of Toronto A certain number are admitted each year to the first medical year who hold arts degrees from recognized universities and who have covered the necessary work in the humanities and sciences The B Sc. (Med.) degree may be conferred for special work or investigation as a graduate degree or under certain circumstances for an extra year's work as an undergraduate The registration for 1950-1951 in the medical and premedical years was 964 graduates 174 The next session for first and second premedical years will begin on Sept 26 1951 and for first, second third and fourth medical years on Sept. 24 1951 The session for premedical years will end on April 26 1952 and for medical years on May 17 1952 Students will graduate annually in June The Dean is J A MacFarlane M B

Quebec

McGill University Faculty of Medicine 3640 University Street Montreal. —Founded in 1823 as Montreal Medical Institution became the Medical Faculty of McGill University in 1829 first class graduated under the university auspices in 1833 No session between 1836-1839 owing to political troubles In 1905 it absorbed the Faculty of Medicine of the University of Bishop s College. Coeducational since 1917 Three years of collegiate work are required for admission. The total fees for each of the four medical years are $525 The registration for 1950-1951 was 457 graduates 115 The last session began Sept. 6 1950 and ended June 2, 1951 for the first three classes and April 28 1951 for the senior class The next session will begin Sept. 5 1951 and will end May 31 1952 for the first three classes and April 26 1952 for the seniors. The Dean is C. Lyman Duff M.D

University of Montreal Faculty of Medicine, 2900 Mount Royal Boulevard, Montreal.—Organized in 1843 as the Montreal School of Medicine and Surgery In 1891 by Act of Parliament, the Medical Faculty of Laval University (organized in 1878) was absorbed. Present name by Act of Parliament in 1920 A class was graduated in 1843 and each subsequent year Coeducational since 1925 The requirements for admission are B.A degree (or its equivalent) with a supplementary year in the Faculty of Pure Science (or an entrance examination on the Premedical subjects) An internship is required for graduation. The fees are $390 yearly for residents and $465 yearly for nonresidents The registration for 1950-1951 was 398 graduates 92. The last session began Sept. 18 1950 and ended May 12 1951 The next session will begin Sept 11 1951 and will end May 3 1952. The Dean is Wilbrod Bonin M.D

Laval University Faculty of Medicine, Quebec.—The Quebec School of Medicine organized in 1848 became in 1852 the Laval University Faculty of Medicine first class graduated in 1855 and a class graduated each subsequent year The fees for each of the medical years average $300 for residents of Canada. Nonresidents are charged an extra fee of $200 each year The premedical requirement is a B.A. degree or its equivalent. The registration for 1950-1951 was 626 graduates 141 The last session began Sept. 13 1950 and ended June 1 1951 The next session will begin Sept. 12 1951 and will end June 1 1952 The Dean is Charles Vézina M.D

APPROVED SCHOOLS OF THE BASIC MEDICAL SCIENCES IN THE UNITED STATES

MISSISSIPPI

University

University of Mississippi School of Medicine.—Organized in 1903 Coeducational since organization A clinical department was established at Vicksburg in 1908 but was discontinued in 1910 after graduating one class. Entrance requirement is three years of collegiate work or ninety semester hours of credit. Fees average $410 50 annually There is a non resident fee of $200 The school operates on an accelerated program by accepting two freshman classes each session The registration for 1950-1951 was 122 The last session began July 31 1950 and ended May 12 1951 Additional freshman class was admitted Jan 29 1951 and will end Oct. 27 1951 The sophomore session began July 10 1950 and ended March 17 1951 An additional sophomore session began Nov 21 1950 and ended July 28 1951 The present freshman class began July 16 1951 and will end April 30 1952 The present sophomore class began June 11 1951 and will end Feb 23 1952. The Dean is David Schultz Pankratz M D

MISSOURI

Columbia

University of Missouri School of Medicine—Organized at St. Louis in 1845 was discontinued in 1855 but was reorganized at Columbia in 1872. Teaching of the clinical years was suspended in 1909 Coeducational since 1872. The entrance requirement is three years of collegiate work. The B S degree in medicine is conferred at the end of the second year Total fees for the first year are $236 50 for the second year $222.50 The registration for 1950-1951 was 89 The last session began Sept 18 1950 and ended June 8 1951 The next session will begin Sept 11 1951 and will end June 5 1952 The Dean is Trawick H. Stubbs M.D

NEW HAMPSHIRE

Hanover

Dartmouth Medical School—Organized by Dr Nathan Smith in 1797 The first class graduated in 1798 It is under the control of the Trustees of Dartmouth College Courses of the third and fourth years were discontinued in 1914 Three years of college work and candidacy for the bache lor s degree are required for admission. Candidates for the A.B degree in Dartmouth College may substitute the work or the first year in medicine for that of the senior year The tuition is $800 for each year The registration for 1950-1951 was 49 The last session began on Sept. 24 1950 and ended June 17 1951 The next session will begin Sept 23 1951 and will end June 8 1952 The Dean is Rolf C Syvertsen M D

NORTH CAROLINA

Chapel Hill

University of North Carolina School of Medicine.—Organized in 1890 Until 1902 this school gave only the work of the first two years when the course was extended to four years by the establishment of a department in Raleigh. The first class was graduated in 1903 A class was graduated each subsequent year including 1910 when the clinical department at Raleigh was discontinued Coeducational since 1914 Three years of college work are normally required for admission Certificates are awarded on the completion of two years work in medicine The tuition is $660 per year for residents for nonresidents an additional $600 per year The registration for 1950-1951 was 117 The North Carolina Legislature of 1947 appropriated funds for the expansion of the school to the full four years The full program will probably not get under way for a year or two The last session began Sept. 18 1950 and ended June 4 1951 The next session will begin Sept. 17 1951 and end on June 2 1952. The Dean is W Reece Berryhill M.D

NORTH DAKOTA

Grand Forks

University of North Dakota School of Medicine.—Organized in 1905 Offers only the first two years of the medical course Coeducational since organization Three years work in a college of liberal arts are required for admission The B S degree in combined arts-medical course is conferred at the end of the second year The fees are $121 50 each year for resident students and $206.50 for nonresidents The registration academic year 1950-1951 was 65 The last session began Sept 18 1950 and ended June 4 1951 The next session will begin Sept. 24 1951 and will end June 10 1952 The Dean is W F Potter M D

SOUTH DAKOTA

Vermillion

University of South Dakota School of Medical Sciences—Organized in 1907 as the University of South Dakota School of Medicine Present title in 1937 Coeducational since organization Offers only the first two years of the medical course Three years work in a college of liberal arts are required for admission Students who complete the third year of premedical work in the College of Arts and Sciences at the University of South Dakota may apply the work of the first year of medicine to an A.B degree The B S. degree is conferred at the end of the second year on those students who do not hold a combination (Arts and Sciences and Medicine Course) A B degree The tuition is $303 for the first year residents and $303 for second year residents $513 for first year nonresidents and $513 for second year nonresidents Registration for 1950-1951 was 63 The last session began Sept. 4 1950 and ended June 7 1951 The next session for first and second year students will commence Sept. 3 1951 and will end June 6, 1952 for first year students and will end Aug. 15 1952 for second year students (There is a thirteen day break between the end of the didactic year for second year students and the four weeks of clerkship and month of clinical teaching at the Veterans Administration Hospital in Sioux Falls, South Dakota.) The Dean is Donald Slaughter M.D

WEST VIRGINIA

Morgantown

West Virginia University School of Medicine.—Organized in 1912. Gives the first two years of the medical course but agreement has been made for the transfer of 20 students each year to the Medical College of Virginia. Coeducational since organization. Entrance requirements are three years of collegiate work. The B S. degree is conferred at the end of the second year Fees for residents of the state are respectively $258 and $268 nonresidents $150 additional each year The registration for 1950-1951 was 56 The last session began Sept. 18 1950 and ended June 4 1951 The next session will begin Sept. 17 1951 and will end June 2 1952 The Dean is Edward J Van Liere M.D

APPROVED SCHOOLS OF THE BASIC MEDICAL SCIENCES IN CANADA

Saskatchewan

University of Saskatchewan School of Medical Sciences, Saskatoon.—Organized in 1926. Coeducational Offers the first two years of the medical course Two years of university premedical work is required for admission The B.A. degree is conferred at the end of the second year The fees are $380 The registration for 1950-1951 was 62 The last session for freshmen began Sept. 19 1950 and ended June 22, 1951 The next session will begin Sept. 24 1951 and will end June 21 1952. The Dean is W Stewart Lindsay M B

FIFTY-FIRST ANNUAL REPORT ON MEDICAL EDUCATION

The fifty-first annual report of the Council on Medical Education and Hospitals which appears in this issue of THE JOURNAL summarizes basic data concerning medical schools and students in the United States and Canada and presents information and statistics on many subjects of current importance

Last year's prediction that the freshman class might reach 7,500 within a few years already appears close to realization The 1950 freshman class totaled 7,182 students and the 1951 freshman class will number approximately 7,400 The total student enrolment of 26,191 exceeds last year's total by more than 1,000 and exceeds the total for 1940-1941, the last pre-war year, by almost 5,000 The full magnitude of this expansion in the capacity of the medical schools may be appreciated when it is realized that it is equivalent to the establishment of 15 new medical schools of average size These growing enrolments are reflected in the increasing size of the graduating classes This year's graduating class totaled 6,135, and by 1953 the number of graduates will almost certainly exceed even the peak of 6,389, reached in 1947 under the accelerated program when several schools graduated more than one class

The report reveals a trend which may indicate a decrease in the general level of competence of incoming medical students In the 1950 freshman class, the number of C students was 20%, as compared with 10% for the preceding year The most likely explanation for this trend is that the large backlog of veterans whose education was delayed by the war has largely disappeared While the schools can no longer draw from such an unusually large pool of able students as was available immediately after the war, there were still slightly more than three applicants for each opening in last year's freshman class

In recent years the report of the Council has repeatedly called attention to the large number of students in addition to regular undergraduate medical students who receive part or all of their instruction from the faculties of the medical schools This year figures were obtained which indicate for the first time the full magnitude of this additional load During 1950-1951 the medical schools provided instruction for more than 57,000 students in addition to their undergraduate medical students These additional students fall into many categories, ranging from students in technical schools and undergraduate courses to advanced graduate students and practicing physicians It is clear that, through the education it provides these students, a medical school makes a major contribution to a university's total program of education, a contribution that is not always recognized

Events of the past year have not yet made clear what the full effect of the present international crisis and the attendant partial mobilization will be on medical education The Joint Committee on Medical Education in Time of National Emergency has been active in studying this problem and in preparing plans for various contingencies In the fall of 1950 the Committee published a statement setting forth in detail its recommendations with respect to the conduct of medical education in a national emergency Early in the present year it prepared and circulated to the medical schools a pamphlet containing suggestions for supplementing the curriculum so as to prepare students to deal effectively with problems of civil defense and military medicine The committee has also been active in making recommendations with respect to the problem of insuring a continuing flow of medical students and medical graduates under a program of selective service or a program of universal military training and service One result of partial mobilization is already clear As long as the needs of the armed forces for physicians continue at their present levels, most able-bodied male graduates will have to interrupt their training at the end of one year of internship for a period of active military duty

Another, although indirect, effect of the current emergency was the decision of the Committee for the Survey of Medical Education that it would not be feasible to visit all medical schools as had been planned when the survey was initiated The survey completed its second year of field work in the spring of this year, at which time 41 of the 79 medical schools and schools of the basic medical sciences had been visited Recognizing that partial mobilization has resulted in increasing demands on the medical schools and recognizing that the schools individually and collectively are faced with urgent decisions on a number of policies, the committee believed that it could render more service to the medical schools and the public by preparing an early report of its findings to date than by continuing its field work. The committee is now addressing its full energy to the preparation of its report, which it is hoped will be published and ready for distribution by the spring of 1952

Although fewer vacancies on teaching staffs are reported this year than last year, medical schools are still experiencing some difficulty in recruiting teachers The total number of vacant full-time positions as of June 1951 was 235 as compared with 281 in 1950 and 441 in 1949 This continuing shortage of teachers underlines the importance of maintaining an adequate flow of graduate students in both the basic and clinical sciences even in the event of more extensive mobilization than that now in effect The need for continuing to train an adequate force of teachers is particularly important in view of the further expansion contemplated by several existing schools and the probability that several new medical schools will be established within the next few years

The report presents further evidence of interest on the part of medical schools in preparing students and recent graduates to serve as family physicians or general practitioners Fifty-four schools are sponsoring one or more programs designed to interest and prepare students for careers in general practice Among these are several that report that their entire educational program has been designed with the primary purpose of preparing students adequately for general practice

For the first time since the end of World War II, a reduction in attendance at postgraduate and continuation courses is reported Although the number of courses offered increased by more than 10%, attendance during 1950-1951 dropped by more than 20,000, or almost 30%, below the preceding year The explanation for this drop is not yet clear It may be due in part to the increased number of physicians entering military service on the one hand, or to the fact that the demand for refresher courses by medical officers who served during World War II has been met on the other hand The reduction in attendance, of course, must also raise the question as to whether postgraduate courses are being planned in a manner calculated to arouse the interest and satisfy the needs of the practicing physician

PROGRESS IN THE FINANCIAL SUPPORT OF MEDICAL SCHOOLS

The annual report on medical education published in this issue of THE JOURNAL reveals that the medical schools are making substantial progress in their struggle to secure more adequate financial support. For the coming academic year they report that their budgets will total $74,350,000 and that they expect to receive an additional $35,250,000 from outside agencies in grants for research and special teaching activities The schools thus will have a total of $109,600,000 available for education and research during the coming year

Earlier this year the Committee on Medical School Grants and Finances appointed by the Surgeon General of the Public Health Service published a report of the study it made of the expenditures and the needs of the medical schools during the academic year 1947-1948 The committee reported that in that year the medical schools spent a total of $70,551,000 for basic operations and for separately budgeted research This figure did not include the expense of maintaining clinical facilities Of the total of $109,600,000 available to the schools for the coming year, about $3,250,000 will be used to support clinical facilities This amount must be subtracted from the total to provide a figure that can be compared with the total expenditure as computed by the committee When this is done it is seen that the medical schools expect to have available in 1951-1952 approximately 36 million dollars more than they spent in 1947-1948

It is of interest to compare this figure with the estimate of the Surgeon General's Committee that the medical school's unmet needs as of 1947-1948 could be financed only by the expenditure of about 40 million dollars more annually than the schools were then spending for education and research In presenting this estimate the committee suggested that the figure of 40 million dollars should perhaps be discounted in part as representing wishes and aspirations The committee further stated that the schools could not absorb an additional 40 million dollars a year immediately but that that figure was a general measure of the level to which operating expenditures of the medical schools should rise in a period of years

It should be pointed out that not all the increase of 36 million dollars in the past four years is clear gain and that not all schools have shared proportionately Part of the increase has been offset by the loss in the purchasing power of the dollar, some of it has been used to support new or expanded activities not provided for in the estimate of 40 million dollars Account must also be taken of the fact that almost 40% of the gain of 36 million dollars is in the form of funds specifically earmarked for research and therefore not available for the schools' unrestricted use

The over-all picture, however, is one which warrants optimism that progress is being made even if unmet needs and some uncertainty regarding the future remain It is perhaps trite to comment that it is unlikely the time will ever come when all needs will have been met and all uncertainty dissipated

Perhaps one of the most important conclusions that may be drawn from this latest report is that the gap between unmet needs and available funds has been narrowed to a point where, if the National Fund for Medical Education and the American Medical Education Foundation could provide an annual fund of 5 to 10 million dollars, the gap that remains for many schools would be all but eliminated It would be a serious mistake to conclude that the battle for adequate financial support for medical education has been won, but it would be equally mistaken not to interpret the gain that has been made as a good omen for the future if the efforts of recent years are maintained

QUOTA PLAN FOR THE APPOINTMENT OF INTERNS DEFERRED

A large majority of the hospitals approved for intern training have accepted the recently announced program (THE JOURNAL, June 30, page 865) of the Council on Medical Education and Hospitals establishing a quota basis for the appointment of interns Some hospitals, however, have requested an increase in the number of internships for which they have been approved A few have protested the setting of any quota

The Council wishes to give every consideration to these requests and protests and is at present investigating and appraising them Therefore, since it will take time to do this, and in fairness to those hospitals that have accepted the quotas as established, the Council believes that the effective date of this program should be deferred until all hospitals have had an equal opportunity to have their requests reviewed When the quota program is fully established, it is planned that individual hospital quotas will be reviewed annually

In the meantime, however, the Council strongly urges, in the interest of stabilizing and improving the training of interns throughout the country, that all hospitals voluntarily cooperate in accepting the quota basis proposed by the Council for the appointment of interns for the year beginning July 1, 1952

NEED FOR BLOOD

The American National Red Cross has been responsible for the national blood program for the armed forces and has been active in the procurement of blood for civil defense The Department of Defense has been dependent on the Red Cross to supply the requirements of the Department throughout this period of national emergency incident to the Korean campaign As a result of the seriousness of the current situation and the need of the Department of Defense for blood plasma within the military departments, a directive has been issued by the Department to the three military services relative to the establishment of a Department of Defense blood collection program The directive reads

1 Department of Defense supplies of dried human blood plasma have been gravely depleted by the demands of the Korean campaign Its continued availability for military purposes is vital It is imperative that action be taken to insure that an adequate supply is at all times ready for use This means that every possible effort must be made to secure whole blood in quantity from all available sources

2 While the processing capacity for converting whole blood to plasma has been gradually increased, the quantities of blood received from civilian sources is today woefully inadequate, and well below processing capacity The essential reserve is not being created

3 Accordingly, the Department of Defense will begin immediately

(*a*) A continuous and vigorous campaign, in conjunction with the Red Cross, to persuade the civilian and military population to contribute whole blood to the Armed Forces

(*b*) To establish an Armed Forces blood donor program within the framework of the over-all campaign, the primary purpose of which shall be to obtain blood from the service personnel on military bases within the continental United States Civilian employees will be invited to participate

The American Medical Association has been asked for its cooperation in this serious and urgent defense program The help of individual physicians is needed, and they are asked to encourage others to participate It is only through active support of the defense program and discussion, at every opportunity, of the need for blood that sufficient amounts will become available

KEEPING THE FAMILY TOGETHER

Medical progress has cut the orphan problem in half since 1900 Although 371,000 children under 18 became orphaned by the death of a parent in 1948, the toll would have been twice that with the death rates of 1900 Likewise the number of marriages broken by the death of husband or wife would have been close to one million,[1] 50% greater than the number reported, 667,000 Chronologically, the process starts at birth with keeping both mother and newborn baby alive The probability of a child being left motherless at birth today is only one-eighth to one-seventh the probability that its mother would have been left motherless at birth, i e , maternal mortality has been sharply reduced in one generation Thus medical progress and longer life are increasing family stability in a period when many families are being broken for reasons other than the death of a parent

The age at death of a father has particular significance from the economic standpoint When the breadwinner of the family is gone, the heavy burden of providing for the home, in addition to rearing the children, is thrust upon the mother The younger the father at death, the heavier the mother's burden, for the greater is the number of years that must elapse before the children are self-supporting

In 1948, there were 91,000 minor children orphaned by the death of fathers under age 45 The 82,000 orphans who survived fathers dying at ages 45 to 54 constituted the greatest number for any age group Fathers who were 55 or over at the time of death left 67,000 children These figures clearly indicate that the majority of orphans are created by the death of middle-aged fathers, the child dependency problem is not as acute for the widow, since many of these children are not far from the age when they may become gainfully employed

The number of minor children becoming orphaned by the death of their mothers was about 132,000, a little more than half the number losing their fathers The widower, spending most of the day at his place of employment, is faced with the problem of providing care for the children while he is away This sort of situation frequently obliges the father to remarry

Thus, in an era when nonhealth factors are breaking up many homes, the sharp declines in mortality have allowed more families to remain intact, particularly until the children have reached their majority The community, too, has benefited by being relieved from the burden of supporting thousands of indigent widows and orphans Medicine has a social mission, and the best way the physician can contribute toward the accomplishment of that mission is to steadily improve the science and art of medicine

ORGANIZATION SECTION

PUBLIC RELATIONS LITERATURE

Four pieces of complimentary literature for distribution to physicians, health groups, and the general public are currently being produced by the American Medical Association's Department of Public Relations Two brochures, one of them now available, are designed for use in doctors' offices The third publication will go to American Medical Association members, the fourth, a revision of the A M A Handbook, will be available to state and county society officers

An attractive, eight page brochure, called "A Doctor for You —What s Being Done to Give You the Best," is the first of the series to be completed In a brief, easy-to-read style it tells the nation that America's doctors "want enough doctors in the United States to meet the medical demands of every man, woman and child Physicians may get copies of "A Doctor for You" through their county and state medical societies The second popular piece, tentatively titled ' What *Is* the A M A?," will be available for similar distribution to the general public by December, 1951

Early this fall, all American Medical Association members will receive an information booklet on their national organization, briefly outlining its history, makeup, functions, and activities The comprehensive Handbook, scheduled for fall distribution to state and county society officers, is designed as a ready reference to American Medical Association councils, committees, bureaus and departments In addition to material contained in the current Handbook, the new publication will list executive personnel, outline recommended procedure to speed service from the Association, and provide a key to existing policy on membership and fellowship

BOOKLET ON GROUP PRACTICE

During the three years since the Bureau of Medical Economic Research published Bulletin 63, "An Annotated Bibliography of Group Practice, 1927-1947," a considerable number of books and articles on the subject of group practice have appeared A new publication, Bulletin 85, has recently been published by the Bureau Items published in 1948 to 1950 have been added, and an author index has been provided for the 317 items The brief annotations are designed to enable the reader to determine whether he should examine the published item As noted in the introduction, all published items relating to group practice have been included, even those which may involve the corporate practice of medicine, there are many items that deal with combinations of group practice and prepaid insurance Thus, the bibliography is not limited to group practice per se The annotations neither approve nor disapprove the ideas of the authors The sole purpose of this new bibliography is to serve as a reference work for those interested in group practice, broadly defined A copy of Bulletin 85 ('An Annotated Bibliography of Group Practice, 1927-1950," 72 pages) may be obtained without charge from *the Bureau of Medical Economic Research*, American Medical Association, 535 North Dearborn St , Chicago 10

CATALOG OF MOTION PICTURES

The catalog of motion pictures available through the Committee on Medical Motion Pictures has been revised Copies will be sent to the secretary of each county and state medical society This catalog lists sixty-two 16 mm films, most of which are at the professional level Fourteen of these films are suitable for showing to lay groups Eight new films have been added Copies are available on request from the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn St., Chicago 10

FEDERAL MEDICAL LEGISLATION

Public Assistance

Representative Reed of New York introduced H R. 5076, pertaining to federal grants in aid to states under the Social Security Act This bill would prohibit the withholding of federal funds due a state for use in certain public assistance programs if the only reason for withholding is the enactment or enforcement of legislation by a state providing for public access to records of the disbursement of funds under such program. Another bill, H R 5083, by Representative Mason of Illinois, would accomplish the same objectives by repealing provisions of the Social Security Act which require state plans for old-age assistance, aid to dependent children, aid to the blind, and aid to the permanently and totally disabled, to restrict the use or disclosure of information concerning applicants or recipients to purposes directly connected with the administration of such plans These two bills are similar in purpose to S 1099 (previously reported)

Increased Social Security Benefits

Senator Humphrey of Minnesota introduced S 1983, for himself and Senators Lehman, Kerr, Murray, and Langer This bill would amend the Social Security Act by increasing insurance payments to retired workers by $5 per month It would also increase the wife's benefit by $2 50 and a widow's benefit by $3 75 The maximum family benefit under this bill would be raised from $150 per month to $160, and the amount below which the total monthly family benefit would not be reduced by the maximum provisions is increased from $40 to $50 The bill does not call for higher rates of contribution than those already authorized by law

Investigation of Cancer Cures

Senator Langer of North Dakota introduced S Res 186, which would authorize an investigation of the efficacy of methods used in the treatment of cancer by institutions This resolution is similar to S Res. 142, by the same author, to investigate only the Hoxsey Cancer Clinic The new resolution would authorize the Senate Committee on Labor and Public Welfare to make a full and complete study and investigation of the efficacy of methods used in the treatment of cancer by any hospital or clinic which has been in operation for at least 10 years and which presents pathological proof of cures of internal cancer in at least five cases One other new provision authorizes the committee personally to inspect such clinics or hospitals and to seek information from the representatives of the Food and Drug Administration the National Cancer Institute, the American Cancer Society, and other persons or agencies having pertinent information

Social Security—Dentists

Representative Herter of Massachusetts introduced H R 4943, which proposes to extend the federal old age and survivors insurance system to persons engaged in the practice of dentistry It will be recalled that, when the social security laws were amended in the last Congress, physicians, dentists, and certain other persons were exempt from coverage

Veterans Presumption of Service Connected Poliomyelitis

Two bills have been introduced which would establish a presumption of service connection for poliomyelitis contracted within five years after separation from active service by World War II veterans who were prisoners of war These bills are H R 5197, introduced by Representative Corbett of Pennsylvania, and H R 5200, by Representative Fulton of Pennsylvania

---

The summary of federal legislation was prepared by the Washington Office of the American Medical Association

MEDICAL NEWS

ARKANSAS

Faculty Appointments.—Dr James H. Growdon, associate professor of surgery since 1949, has been appointed professor and head of the department of surgery at the University of Arkansas School of Medicine, Little Rock. He replaces Dr Gilbert O Dean, who has resigned to enter private practice Dr William K. Jordan, formerly head of the division of neurology at the University of Washington School of Medicine, Seattle, has been appointed professor of neurology and head of the division of neurology in the department of psychiatry and neurology, effective Sept 1 J Walker Beck, Ph D has been named assistant professor of bacteriology and parasitology

CALIFORNIA

Dr Wood Heads University Cancer Institute.—Dr David A Wood, Stanford University pathologist, has been appointed director of the Cancer Research Institute of the University of California School of Medicine, San Francisco, effective Sept 1 He succeeds Dr Robert S Stone, professor of radiology, who has been acting director since the establishment of the Institute in 1948 Dr Wood became a member of the Stanford faculty in 1930 and has been affiliated with that institution since then. His active service during World War II included directorship of the Oak Knoll Laboratories, Oakland, for two years and the organization of blood banks at Treasure Island and Oak Knoll Dr Wood has been secretary of the Cancer Commission of the California Medical Association since 1945 He was secretary of the California division of the American Cancer Society from 1945 to 1949 and is now professional director for Region VI of the national organization

DELAWARE

State Medical Meeting.—The Medical Society of Delaware will hold its annual meeting at the Hotel DuPont in Wilmington Oct 8-10 Scientific sessions beginning Oct. 9 will be addressed by the following out-of state speakers

Douglas T Davidson Jr Boston Diagnosis and Treatment of Epilepsy
Richard G Coblentz, Baltimore, Craniocerebral Injuries.
C. Everett Koop Philadelphia Certain Aspects of Surgery of the Newborn
Leo E Farr Upton Long Island N Y Treatment of Nephrosis.
Hugh Montgomery Philadelphia Treatment of Peripheral Arterial Disease.
R. Ralph Bresler Philadelphia Industry s Challenge to Medicine.
Franklin L Payne Philadelphia Care of the Woman in the Postmenopausal Era.
O Spurgeon English Philadelphia Role of the General Practitioner in Counselling Before and After Marriage.
J Robert Willson Philadelphia Potential Dangers from the Incomplete Examination of the Pregnant Woman
P Robb McDonald, Philadelphia Retrolental Fibroplasia
H Clinton Davis Philadelphia, Management of Intractable Achalasia

At the reception and dinner Tuesday evening Dr John W Cline, San Francisco President of the American Medical Association, will give the address The Woman s Auxiliary to the association will meet Oct 9 10 at the Delaware Academy of Medicine

IDAHO

State Medical Election.—At the annual meeting of the Idaho State Medical Association in Sun Valley June 15-18 Dr Alfred M Popma, Boise, was installed as president Officers elected include Dr Wallace Bond, Twin Falls, vice president, and Dr Robert S McKean, Boise secretary treasurer Dr Hoyt B Woolley, Idaho Falls, was named delegate to the American Medical Association, with Dr Raymond L White Boise, as alternate

ILLINOIS

Society News.—Newly elected officers of the Illinois Society for Medical Research are Drs Anton J Carlson, professor emeritus of physiology at the University of Chicago, president, Dr Andrew C. Ivy, vice president and head of the professional colleges University of Illinois, vice president, N R Brewer, superintendent of animal quarters, University of Chicago, secretary, and Dr Carl C Pfeiffer, head of the department of pharmacology of the University of Illinois, treasurer The society, an affiliate of the National Society for Medical Research, is planning to expand its membership and activities.

Requirements for Municipal Fluoridation of Water.—Requirements to be met by cities prior to receiving Illinois State Department of Public Health approval for addition of tooth decay preventing sodium fluoride to public water supplies have been revised and simplified by the department The new requirements are as follows

1 The municipality must pass an ordinance or resolution indicating the public s decision to fluoridate the public water supply submitting a copy to the Illinois Department of Public Health.

2. Evidence of acceptance and approval of fluoridation by local medical and dental groups must be submitted by a resolution or other document

3 In accordance with the Illinois Department of Public Health s statutory jurisdiction over public water supplies engineering plans and specification for the *installation* of the fluoridation process must be prepared and submitted for review and approval prior to installation

The health department is encouraging addition of fluorides to public water supplies in concentrations not to exceed one to one and one half parts of fluoride to a million parts of water

Chicago

Blatt Memorial Lecture—The third Maurice Lamm Blatt Memorial Fund Lecture will be given by Dr Irvine McQuarrie, professor and head of the department of pediatrics, University of Minnesota, Minneapolis, who will speak on 'Clinical and Experimental Studies on Hypoglycemia ' This lecture, sponsored by the pediatric staff, will be given at 8 30 p m. Oct 2, in the Medical Amphitheatre of Cook County Hospital All interested physicians are invited to attend

Tuberculosis Deaths Reduced Twenty Per Cent.—According to Dr Herman N Bundeson, president of the board of health, tuberculosis deaths in Chicago declined 20 1% in the first six months of 1951 compared with a similar period last year Through June, 1950, there were 603 tuberculosis deaths, and in the same period in 1951, 482 deaths Dr Bundeson credited the decrease to greater public health knowledge Between 1945 and 1950, he said, the city s tuberculosis death rate was cut 41%, reaching a figure of 29 3 per 100 000 persons Chicago plans to step up its campaign against tuberculosis in keeping with the plans of Dr Ernest E. Irons, president of the Chicago Municipal Tuberculosis Sanitarium. For the year ending March 31, the Tuberculosis Institute and the sanitarium jointly conducted a mass x-ray survey of 459,220 persons in Cook County, 9,586 suspected cases of tuberculosis were found.

MARYLAND

General Practice Assembly.—The third assembly of the Maryland Academy of General Practice will be held Oct 4 in the Lord Baltimore Hotel, Baltimore Papers will be read by the following

William G Lennox, Boston Convulsive Disorders
Wallace M. Yater Washington D C. Cardiac Emergencies
Sidney A Portis Chicago Treatment of Liver Diseases
Lloyd F Craver New York The Leukemias and Hodgkins Disease
Robert B Greenblatt Augusta Ga Endocrinology in Gynecology
John C. Krantz Jr Ph.D., Baltimore Use and Abuse of Some of the Newer Drugs.
Lewis K. Ferguson Philadelphia Ambulatory Surgery
Irvine McQuarrie Minneapolis Causes and Therapeutic Management of Spontaneous Hypoglycemia

---

Physicians are invited to send to this department items of news of general interest, for example those relating to *society activities new hospitals,* education and public health Programs should be received at least three weeks before the date of meeting

MICHIGAN

Hospital News—St Joseph Hospital and Medical Center, Hancock, was dedicated July 29 The new seven-story 170-bed hospital was erected and equipped at a cost of $2,500,000 It will be operated by the Sisters of St Joseph of Carondelet

State Medical Meeting.—The Michigan State Medical Society will hold its annual meeting at the Pantlind Hotel and Civic Auditorium in Grand Rapids, Sept 26-28 Out-of-state speakers include the following

Reginald H Smithwick Boston Surgical Measures in the Management of Hypertensive Cardiovascular Disease.
Sara M Jordan Boston Peptic Ulcer Complications and Treatment
Ralph A Reis, Chicago Prolonged Labor
Stephen Rothman Chicago Neurodermatitis (Atopic Eczema)
Willis J Potts Chicago Intestinal Obstruction in Infants and Children Due to Congenital Anomalies
Austin I Dodson Richmond Va Indication for Surgery in the Treatment of Nephroptosis
Albert H Aldridge New York Complete Abdominal Hysterectomy
Charles R. Doyle St. Louis Acute Conditions of the Abdomen
Richard V Ebert Minneapolis, Differentiation of Dyspnea Caused by Cardiac Disease from Dyspnea Associated with Pulmonary Emphysema
Henry L. Williams Rochester Minn Physiologic Phenomena Misinterpreted as Rhinologic Disease
S William Becker Chicago The New Versus the Old in the Treatment of Syphilis.
Elmer L. Sevringhaus Nutley N J Vitamin Therapy in Clinical Practice
John Martin Chicago Neurosurgical Methods for the Relief of Pain
Walter P Blount Milwaukee Treatment of the Painful Hip
Waldo E. Nelson Philadelphia Errors in the Therapy of Infectious Diseases in Infants and Children
James W Kernohan Rochester Minn Peripheral Neuritis
Oscar T Clagett, Rochester Minn Mediastinal Lesions
Raymond D Pruitt Rochester Minn Recent Advances in Diagnosis of Heart Disease

At the general public meeting Wednesday evening, Clarence Manion, dean of the College of Law, University of Notre Dame, South Bend, Ind, will deliver the Biddle Lecture on 'The Key to Peace' Twenty two quiz periods will be held in the late afternoon of each day, when questions may be directed to various visiting speakers The Woman's Auxiliary will meet Sept 25-27 On Thursday evening at 10 30 there will be a State Society Night of entertainment with dancing and a floor show at the hotel

NEW JERSEY

Medical Practice Act Violations.—The Board of Medical Examiners of the department of law and public safety, Trenton, has reported the following violations of medical practice during July and August On July 6 Alfred W Steever of Riverside, an unlicensed chiropractor, was tried in the Burlington County District Court on a charge of practicing medicine without a license, and was found guilty He took x-rays, used a neuromicrometer machine for diagnostic purposes, and gave adjustments to various parts of the body On July 9 William H Richmond of Red Bank, a registered pharmacist, paid a penalty for practicing medicine without a license On July 9 Joseph Tuliglowicz of Newark, a naturopath, paid a penalty for practicing medicine without a license He gave adjustments and electric treatments and ordered various remedies This was a sixth offense On July 9 Henry G Garruto of Red Bank, an unlicensed chiropractor, paid a penalty for practicing medicine without a license He took x-rays, blood pressure and adjusted various parts of the body On July 23 George Lezenby Sr, Camden, paid a penalty for practicing medicine without a license He gave electric and manipulative treatments This was a seventh offense On Aug 4 the following persons paid penalties for practicing medicine without a license George B Van Dyke of Trenton, a naturopath who gave manipulative and electric treatments, a third violation, Sara Sussman of Passaic, a physiotherapist, who gave colonic irrigations, sinusoidal wave treatments, and diets for reducing, a second offense, James A Mackey of Trenton an unlicensed chiropractor who adjusted various parts of the body a fourth violation, and Norman O Carver of Neptune City, a naturopath and unlicensed chiropractor, who gave short wave treatments, massage, manipulative treatments and medicine

NEW YORK

Biggs Award—The Hermann M Biggs Memorial Award has been established by the state public health association It will be given annually for "outstanding service in the cause of better health for the people of New York State" The plaque and a certificate may be presented to a public health worker or to any outstanding citizen in the health field The award was established in memory of Dr Biggs, who served as the state's first health commissioner from 1913 to 1923

New York City

Personal.—Dr Leonard J Goldwater, professor of industrial hygiene at the Columbia University School of Public Health, New York, has been recently appointed a member of the World Health Organization expert advisory panel on social and occupational health

Hospital Record Year.—The Hospital Council of Greater New York has reported that hospitals in the city during 1950 provided the largest number of days of general care in the past 15 years 9,669,987 days This represents an increase of more than 1,200,000 days of care since 1944 The figure indicates a trend toward more efficient utilization of available facilities since there has been no major increase in the number of hospital beds

Dr Nelson Heads Department.—Dr Carl T Nelson, assistant clinical professor of dermatology at Columbia University College of Physicians and Surgeons, has been named executive of his department succeeding the late Dr A Benson Cannon Dr Nelson, who joined the university staff and the clinical staff of Vanderbilt Clinic in 1946, had been a member of the bacteriology department of Harvard Medical School, Boston, until he entered the Army medical service during World War II During that time he served as chief of the department of epidemiology and bacteriology for the Fourth Service Command at Fort McPherson, Ga

PENNSYLVANIA

State Heart Association Grants—The Heart Association of Southeastern Pennsylvania has made three grants in-aid A grant of $4,000 was made to St Christopher's Hospital for a study of rheumatic fever among the pupils of the public and parochial schools of Philadelphia, and a similar grant was made to the Children's Hospital of Philadelphia The work at St. Christopher's Hospital will be supervised by Dr Waldo Nelson and Dr Robert Wells, and that at Children's Hospital by Dr Rachel Ash The third grant-in aid was made to Dr Thomas M McMillan and Dr Samuel Bellet at the Philadelphia General Hospital for studies in the recent advances in arteriosclerosis, with particular reference to coronary arteriosclerosis

Philadelphia

Course in Clinical Endocrinology—This course will be given at Philadelphia General Hospital on Wednesday afternoons 4 30 to 6 p m beginning Sept 26 There will be 30 sessions under the direction of Dr William H Perloff A discussion period will be an integral part of each session Participating lecturers, all from the hospital staff, include Dr Perloff and Drs Thomas M Durant, William E Ehrich, Herman W Ostrum, Norman G Schneeberg, and Sholom O Waife, and Harry Hadd, M S

WASHINGTON

Meeting on Obstetrics—The Washington State Obstetrical Association will hold its fall meeting Sept 8 at the Washington Athletic Club in Seattle Dr Eakle W Cartwright, associate clinical professor of obstetrics and gynecology at the University of Southern California School of Medicine, Los Angeles, will speak on 'Bleeding in the Third Trimester of Pregnancy,' and Dr Gilbert J Vosburgh, professor of obstetrics and gynecology at the Western Reserve School of Medicine, Cleveland, will speak on 'Recent Advances in Obstetrics' Dr Albert W Holman, former associate in obstetrics and gynecology at the University of Oregon Medical School, Portland, will serve as moderator at the symposiums following the luncheon and the banquet

State Medical Meeting.—The annual convention of the Washington State Medical Association will be held at the Olympic Hotel, Seattle, Sept 9 12 under the presidency of Dr Kenneth L Partlow, Olympia The program of sports, entertainment and business sessions will begin Sept 8 and will be followed by the general scientific sessions Visiting speakers include Dr Edward D Allen, Chicago, whose subject will be Diagnosis, Treatment and Etiological Factors in Endometriosis and Dr Stewart G Wolff, New York, who will speak on "Practical Aspects of Treatment of Headache" On Tuesday afternoon there will be a symposium on alcoholism with Drs Ted A Loomis, Walter L Voegtlin, and Stephen Fleck, all of Seattle as participants A forum on Fundamental Problems, over which Dr James W Haviland, Seattle, will preside, is to be held Wednesday afternoon The buffet luncheon will take place Wednesday noon with Clem Whitaker and Leone Baxter, public relations consultants of the American Medical Association as speakers The guest speaker at the Tuesday luncheon will be John M McClelland Jr, editor of the Longview Daily News, who will speak on Better Working Relationship Between the Journalism and Medical Professions, in connection with the efforts of the Washington State Medical Association and the Allied Daily Newspapers to develop a code of cooperation

WISCONSIN

State Medical Meeting.—The annual meeting of the State Medical Society of Wisconsin will be held at the Hotel Schroeder and Milwaukee Auditorium Oct 1 3 under the presidency of Dr Henry H Christofferson, Colby The preliminary program lists the following visiting speakers at the general sessions

Franklin D Johnston Ann Arbor Mich Accurate Cardiac Diagnosis
O Spurgeon English Philadelphia A Treatment Plan for Psychosomatic Illness.
George M Lyon Washington D C Medical Aspects of Atomic Exposure
Frank H Bethell Ann Arbor Mich Treatment of Anemia
Edward M Dorr Chicago Obstetrical Anesthesia and Analgesia
George M Guest Cincinnati Salicylate Poisoning
John P Caffey New York Some Recently Recognized Bone Lesions in Children
Carl A Moyer Dallas Texas The Changing Aspect of Gastric Cancer
Everett I Evans Richmond Va Dangers of Delayed Operation in Intestinal Obstruction

On Monday afternoon there will be a symposium on Coronary Heart Disease, the participants being Drs John B Miale, Marshfield Wis, Franklin D Johnson Ann Arbor, Mich Francis F Rosenbaum, Milwaukee, and Joseph W Gale Madison Wis On Tuesday morning there will be a symposium on Carcinoma of the Lung the participants being Drs William A D Anderson, Milwaukee, Lester W Paul Madison Wis, and Oscar T Clagett, Rochester, Minn The dinner speaker on Oct 2 will be Donald J Cowling, Ph D president emeritus of Carleton College Northfield Minn whose subject will be Our American Heritage" There will be daily special teaching programs from 9 to 10 15 a m on fractures obstetric problems, anesthesia, hearing, and x ray interpretations Round table luncheons will be held daily and section programs will be given from 2 30 to 4 30 p m Oct 3

GENERAL

Neurosurgical Society Meeting.—The Neurosurgical Society of America will hold its fourth annual meeting in Sun Valley, Idaho Sept 12-14 Panel discussions make up the program for the first two days and individual papers will be presented Friday morning Discussions and moderators are as follows.

Clinical Pathologic Conference Alfred Uihlein Mayo Clinic Rochester Minn
Hypertension, Charles E Troland Medical College of Virginia Richmond Va
The Therapy of Gliomas Francis J Otenasek Baltimore

Dr Antunes Appointed Assistant Director—Dr Paulo C A Antunes has been appointed assistant director of the Pan American Sanitary Bureau, Regional Office of the World Health Organization, replacing Dr John R Murdock who resigned to return to the U S Public Health Service Dr Antunes has been in charge of the bureau's public health programs for the past three years On May 30, while in São Paulo, Brazil, he was appointed dean of the School of Hygiene and Public Health of the University of São Paulo, Dr Antunes was released by the university, and the assistant dean of the school will carry on during his absence From 1945 to 1947 he was professor of rural health practice and parasitology at the School of Hygiene and Public Health in São Paulo, and he was made director of the São Paulo State department of health in 1947 In 1949 he was released from this position by the Brazilian government in order to accept his post as chief of the Division of Public Health in the Pan American Sanitary Bureau in Washington

Transcriptions of Community Action Series Available—Transcriptions of "All Their Powers," five half hour radio documentaries on community action for better health, are being made available to community groups for rebroadcast The programs were originally broadcast as a public service May 12 to June 9, by the Health Information Foundation and the National Broadcasting Company, coproducers The foundation 420 Lexington Ave, New York 17, makes no charge for use of the recordings but asks that they be returned promptly Community groups wishing to promote use of the programs should first approach the program manager of the local NBC station If he is not interested, or no NBC station exists in the town, the Health Information Foundation will provide information about what local station may be able to use the programs

Association Meeting.—The American Association of Obstetricians, Gynecologists and Abdominal Surgeons held its annual meeting at The Homestead, Hot Springs, Va, Sept 6-8 under the presidency of Dr James K Quigley Rochester, N Y Those speaking by invitation included the following

Robert J Kellar Edinburgh Scotland The Joseph Price Oration Circulation in Pregnancy
Andrew A Marchetti Washington D C Homologous Ovarian and Testicular Tumors
Joseph A Hardy Jr St Louis Mesodermal Mixed Tumors of the Uterus
Allan C Barnes Columbus Ohio Studies in the Cholinesterase Hormone Relationship
Silas H Starr Louisville Prolonged Labor

The speaker at the banquet at 7 30 p m Friday was Dr Alvah S Miller, Wuchang, Hupeh, China

Vermont New Hampshire Joint Annual Meeting.—The joint annual meeting of the New Hampshire and Vermont state medical societies will be held at the Equinox Hotel, Manchester, Vt, Sept 30 through Oct 2 Visiting speakers at the general sessions include the following

John S L. Browne Montreal Canada Basic Considerations in the Use of ACTH and Cortisone
Chester S Keefer Boston Present Day Evaluation of Antibiotics
John F Merrill Boston Hypertension
John Rock Boston Physiology of Conception Its Disorders and Treatment
Ebbe Curtis Hoff Richmond Va The Virginia Program for the Rehabilitation of Addictive Drinkers

There will be section meetings Monday afternoon and a series of special meetings beginning at 4 p m At the banquet at 7 p m Monday the speaker will be Ralph E Flander, Springfield senator from Vermont The woman's auxiliaries will meet in conjunction with the associations

Grants and Fellowships in Cancer Research—The Committee on Growth of the National Research Council acting for the American Cancer Society, is accepting applications for grants and fellowships Applications for new grants will be received until Oct 1 Investigators will be notified individually regarding application for extension of present grants Final decision on applications will be made early in 1952 Grants approved at this time ordinarily will become effective July 1, 1952 Applications for American Cancer Society Fellowships in Cancer Research received prior to Nov 1 will be acted upon by the Committee on Growth in December Those received between Nov 1 and March 1 will be acted upon in April Fellowships ordinarily will begin July 1, though this date may be varied at the request of the applicant Details regarding availability of Damon Runyon Fellowships will be announced later During the past year the *American Cancer Society, Inc, on recommendation of the Committee on Growth* has awarded grants and fellowships approximating 2 million dollars. A program of similar magnitude is contemplated for the coming year Application blanks and additional information may be obtained from the Executive Secretary, Committee on Growth, National Research Council, 2101 Constitution Ave, N W, Washington 25, D C

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States in the weeks ended as indicated

FOREIGN

Symposium on the Adrenal Cortex.—A symposium on the 'Influence of Hypophysis and the Adrenal Cortex on Biological Reactions,' organized by the Swiss Academy of Medical Sciences, will take place in Zurich, Sept. 30-Oct. 3, immediately after the International Congress of Allergists The speakers will be the following

- Robert S Levine Chicago The Adrenal Cortex as a Regulator in Tissue Reactions
- Burton L. Baker Ph.D, Ann Arbor Mich. Influence of the Adrenal Cortex on Tissue-Reactions to Simple Injuries with Regard to Different Tissue Elements.
- *Thomas F Dougherty* Ph.D Salt Lake City Influence of the Adrenal Cortex on Allergic Reactions (a) Anaphylaxis (b) Eczematous Allergy
- D A Long London, Influence of the Adrenal Cortex on the Allergic Reactions (c) Infectious Allergy
- Gregory Shwartzman New York, Influence of the Adrenal Cortex on the Allergic Reactions (d) Hemorrhagic Reactions

GOVERNMENT SERVICES

ARMY

International Industrial Medical Congress—Official representative of the Army Medical Service at the 10th Annual International Congress of Industrial Medicine to be held in Lisbon, Portugal, Sept 9 15 will be Col Wesley C Cox, commanding officer of the Army environmental health laboratory and consultant to the Surgeon General of the Army on occupational health and hygiene This international assembly of leaders in the field of industrial medicine is private rather than governmental, although public officials and agencies cooperate in its sessions It is estimated that more than 600 scientists will convene from Europe and North and South America, but no requests to attend the meeting have been received from countries within the Communist orbit The congress program includes discussions on social protection of the worker, industrial hygiene, and the pathology of work

Research on Ryukyu Islands—A $100,000 program of scientific investigation in the Ryukyu Islands, designed to rehabilitate the health and economy of the islands, has been started by the Department of the Army in cooperation with the Pacific Science Board of the National Research Council

Nine prominent scientists have been selected to conduct research and to give advice in the fields of public health, food and natural resources, and civil information and education Among them are Dr Robert R Trotter of the Massachusetts Eye and Ear Infirmary, who will work on problems of eye diseases, and Albert V Saleeby of Hopewell, Va, formerly with the Atomic Bomb Casualty Committee in Japan, who will conduct a parasitological survey Plant, animal, and insect surveys will be carried out by other members of the group

NAVY

Aviation Medicine Program.—On Aug 17 the Naval School of Aviation Medicine at Pensacola, Fla, presented to its students, faculty, and guests from the Pensacola Naval Hospital another distinguished speaker, Col Victor A Byrnes, USAF (MC), head of the department of ophthalmology at the Air Force School of Aviation Medicine, Randolph Field, Texas This was a continuation of a program bringing outstanding men in the various clinical specialties to the naval school Colonel Byrnes, who is chairman of the Armed Forces National Research Council Vision Committee spoke on "Ophthalmological Problems Occurring in Major Disasters"

Specialists in Navy Medical Corps.—Since February, 1950, 89 naval medical officers have been certified in various specialties, and 47 have passed part I of their board examinations There are presently on duty 293 Navy medical officers certified by the American Board in the following specialties anesthesia, four, dermatology and syphilology, 11 gastroenterology, one, internal medicine, 32, obstetrics and gynecology, 24, ophthalmology, 25, otolaryngology, 25, pathology, 20, pediatrics, 12, preventive medicine and public health, 16, psychiatry and neurology, 43, radiology, 23, urology, 13, surgery, 30, orthopedic surgery, 10 plastic surgery, one, neurosurgery, one, and thoracic surgery, two

Bio Sciences Group Establishes Clinical Branch—The biological sciences division of the Bio Sciences Group Office of Naval Research, has established a clinical branch headed by Capt J A C Gray, (MC) USN The duties of the Clinical Branch will include liaison with the Bureau of Medicine and Surgery, handling of a more applied program for the Office of Naval Research, and interpretation and application of fundamental research to Navy needs The Bio Sciences Group, which is divided into the biological sciences division and the human resources division, now has 10 branches In the biological sciences division are the physiology, biochemistry, microbiology, biology, dental, and clinical branches In the human resources division are the human relations, psychophysiology, manpower and personnel, and training branches Capt C W Shilling heads the Bio Sciences Group, while Drs Orr E Reynolds and J W MacMillan are directors of the two divisions

Naval School of Aviation Medicine—The research department of the Naval School of Aviation Medicine, NAS, Pensacola, Fla, reports the following changes in personnel

Lt (J G) J L Cannon, MC, USNR, a graduate of the 59th class of the school, has joined the department to assist Capt Ashton Graybiel in cardiovascular research Comdr E G Hurlburt, MC, USN, instructor in dermatology, has been detached for duty as senior medical officer aboard the USS *Leyte* Capt H J Rickard, MC, USN, has reported to the medical department, NAS, Pensacola, to become senior medical officer of the Air Station Capt Rickard formerly served in the same capacity at the NAS in Atlantic City He relieves Comdr M H Goodwin, MC, USN, who reports to the Bureau of Aeronautics in Washington as liaison officer for the Bureau of Medicine Comdr E E Hedblom, MC, USN, senior medical officer at the Naval Air Administration Service, Whiting Field, departs for duty with the Pacific Medical Air Transport Service at Hickam Field, and will be relieved by Comdr C L Rickard, MC, USN, who comes from the USS *Leyte*

Naval Hospital Addition.—A 15 million dollar addition to the Naval Hospital at St. Albans, Queens, N Y, was dedicated Aug 15 The new building, representing the largest single contract for hospitals ever made by the Navy, will accommodate more than 600 patients In the event of an atomic emergency the addition along with the present temporary structures erected in World War II are expected to be able to care for 4,500 patients Rear Adm Lamont Pugh, the Navy's Surgeon General, delivered the dedicatory address at ceremonies attended by high ranking military officers, and congressional, civic, and medical representatives

AIR FORCE

Special Assistant Named to Surgeon General.—Col Jack Buel, USAF (MSC), has become special assistant to the Surgeon General of the Air Force He assumes major administrative duties on behalf of the Office of the Surgeon General Colonel Buel has been deputy for research to the USAF School of Aviation Medicine, research advisor, and chief of the department of psychology He recently was the Air Force representative in the group working on "human behavior under conditions of military service" for the Office of the Secretary of Defense

New Aviation Medical Examiners.—Seventy-one medical officers of the U S Air Force received diplomas Aug 18 at graduation exercises of the School of Aviation Medicine held in the Randolph Field, Texas, officers club Guest speaker was Maj Gen Dan C Ogle, Deputy Surgeon General of the U S Air Force The diplomas, designating each officer as an Aviation Medical Examiner, were presented by Brig Gen Otis O Benson Jr, commandant of the aeromedical school The student officers will not actually acquire the AME rating until they have successfully completed a three months supervised preceptorship in the field During this period each must conduct 50 physical examinations for flying and log 25 hours of flying time in military aircraft. They will then be qualified for duty with Air Force units, where their primary mission will be to conduct physical examinations for flying The preceptorship requirements were added last September when the AME course was shortened from 11 to six weeks due to the urgent need for medical officers in the Air Force. Following completion of their preceptorships, the graduates can qualify for the rating of Flight Surgeon on serv ing an additional year in the field, and on receiving a proper recommendation

The majority of the student officers were first lieutenants, 15 of whom received promotion to captain after entering the school The total group included four regular, one National Guard, and 66 reserve officers This graduation brought to 333 the number of AME graduates at the School of Aviation Medicine since Jan. 1 It was the largest class since World War II

Medical Examiners' Tour —A 10-day postgraduate tour of four of the leading Air Force technical bases was begun Aug 20 by 15 members of the Aviation Medical Examiner class of the School of Aviation Medicine Members of the party were especially selected from among the 71 medical officers who graduated from the AME course Aug 18 All but three of the 15 were rated officers, and their selection was based on this rated experience or continued specialized study in aviation medicine Starting from Randolph Field the group flew first to Elgin Field, Fla, where for two days they observed the giant cold weather hangar and various operational tests Next, they visited Wright-Patterson AFB, Ohio, for a four-day study of facilities and developments of special concern to pilot doctors Proceeding then to the west coast, the group visited Travis AFB to observe all phases of air evacuation, and then went to Edwards AFB at Muroc, where they studied deceleration tests and experimental aircraft. Project officer in charge of the medical group was Capt. Alonzo M Donnell Jr

PUBLIC HEALTH SERVICE

Community Mental Health Program.—The importance of community services to a program to improve mental health is highlighted in the third annual report of the Prince George s County Mental Health Clinic. The clinic was established in 1948 by the Public Health Service as a demonstration of how a mental health program could be planned within the framework of a general local health program Through an exchange of information with other mental health workers the center has gained a considerable fund of information on the methods and types of programs most suitable for different types of communities

Preservation and improvement of mental health in a community, the clinic has found, is basically dependent on the effective utilization of community services for health, welfare, and education before adjustment difficulties become serious Important components in any preventive program are special classes in schools, school testing programs, good foster home programs, careful placement and adoption services, children s protective services, family service agencies, institutional facilities for retarded children, and specialized mental hygiene services

The clinic worked on several special projects during the year with the county department of education and the county health department. One of these was the preparation of a mental health section, including a description of symptoms of pupil maladjustment, in the teachers health manual Another was a study to determine how teachers could recognize problems of adjustment facing the school child A project for the early recognition and alleviation of anxiety producing situations in mothers and children was continued in the prenatal and well baby clinics Another project consisted of a series of seminars to inform the medical personnel of the local telephone company about the relationship of absenteeism and symptoms of maladjustment

Dr Halverson to Head Inter-American Survey.—Appointment of Dr Wilton L. Halverson of California to head a special joint survey to evaluate the health and sanitation programs of 17 Central and South American countries was announced Aug 21 by Dr Leonard A Scheele, Surgeon General of the Public Health Service and Kenneth R. Iverson, president of the Institute of Inter-American Affairs Dr Halverson has been given a six-months leave of absence from his position as director of Public Health of the California state health department to head the survey, which is being carried on under the supervision of the Public Health Service. His appointment to the regular corps of the Public Health Service in the permanent grade of medical director has been approved by the Senate.

The major purpose of the survey is to appraise the influence of the IIAA's nine-year health and sanitation program on the development of local health organizations, the rate at which the programs and methods are being incorporated into the permanent health structure, and the extent to which the health habits of the people are being influenced The survey will be conducted under the direction of Assistant Surgeon General Joseph Mountin, associate director of the Bureau of State Services, Public Health Service, and Dr H van Zile Hyde, director of the health and sanitation division of the Institute of Inter-American Affairs The Public Health Service is staffing and administering the survey with funds allotted by the Institute of Inter American Affairs

A graduate of the College of Medical Evangelists and Yale University, Dr Halverson is a member of the National Advisory Health Council, advisory group to the Surgeon General He is chairman of the American Public Health Association s committee on administrative practice, president of the United States-Mexico Border Health Association, past president of the State and Territorial Health Officers' Association, and a member of the scientific board of the Rockefeller Foundation

Dental Research Program —Whether sodium fluoride taken by pregnant women will provide protection for their offspring against tooth decay will be investigated with the aid of a grant awarded by the Dental Research Institute of the National Institutes of Health This investigation, under the direction of Dr Reuben Feltman of the Passaic General Hospital, Passaic, N J., will attempt to establish whether a fluorine solution administered during pregnancy transfers the fluorine to the fetal bloodstream and whether such transference is beneficial Surveys previously made in South Africa have shown that the baby teeth of children whose mothers had fluorine in drinking water during pregnancy were remarkably free from tooth decay Sodium fluoride (one part to a million parts of water) provides about 65% protection against dental caries for those children who have received it since infancy

Under a grant made to Dr S J Kreshover of the Medical College of Virginia in Richmond, investigation will be made of the effect of prenatal disturbances on the teeth and dental tissues of children Other grants totalling $179,878 will be devoted to the investigation of such problems as the periodental diseases, calcification, malocclusion, and growth changes in the head, face, and teeth during the period of changing dentition

Cancer Morbidity Survey.—The incidence rate of newly diagnosed cancer among residents of New Orleans increased 11% from 1937 to 1947, according to a survey made by the Cancer Institute of the National Institutes of Health at Bethesda, Md The New Orleans survey was carried out in cooperation with the Orleans Parish Medical Society, New Orleans Hospital Council, and the Louisiana State Department of Public Health It is the third in a series of cancer morbidity studies covering 10 representative metropolitan areas in the United States Already published are studies dealing with the Atlanta and the San Francisco areas, both of which also revealed increases in cancer incidence In Atlanta and San Francisco as well as in New Orleans, Public Health cancer authorities attribute some of the increase to improvements in diagnosis, reporting, and case finding.

Remaining surveys will deal with Birmingham, Chicago, Dallas, Denver, Detroit, Philadelphia, and Pittsburgh Comparative data are available for the 10-year period because all the areas were originally surveyed in 1937-1939 When the individual reports are completed, Cancer Institute statisticians will prepare a summary report for the nation as a whole. Copies of the survey may be obtained from the National Cancer Institute, National Institutes of Health, Bethesda 14, Md

Deadline for Research Grant Applications —Dr W H Sabrell Jr, director of the National Institutes of Health, stated that Nov 1, 1951, is the deadline for the first group of Public Health Service grants to be awarded for the 1952-53 fiscal year The grants will be reviewed by the national advisory councils next February Closing date for applications to be considered at the June council meetings is March 1, 1952 Applications for research grants should be addressed to the Division of Research Grants, National Institutes of Health, Bethesda 14, Md

FOREIGN LETTERS

PARIS

Fetal Malformation—The role of infections and vascular disorders in the genesis of fetal malformations and the protection of the mother and fetus were discussed at a recent meeting of the National Academy of Medicine An interesting discussion followed a report by Prof Piédelièvre on therapeutic abortion French law allows the interruption of pregnancy only if the mother's life is imperiled, but the pathologic consequences of a pregnancy for the mother and the possibility of an ill-fated procreation caused the subject to be reconsidered Prof Cathala, who had already mentioned, at the Society for Legal Medicine, the consequences for the fetus of rubella in the mother early in pregnancy, reiterated that certain infections are suspected of giving rise to agenesis, malformation, and sensory disturbances He had seen two cases of microcephalus following acute benign infectious jaundice in the fourth month of pregnancy, but he also saw four women with icterus in the course of their pregnancy who gave birth to normal children Varicella, measles, scarlet fever, and herpes zoster may also provoke abortion or fetal malformation during the first two or three months of pregnancy A commission was appointed for the study of the problem

Seriousness for the Fetus of Unapparent Disease of the Mother—A and P Giroud, M Martinet and R Vargues have endeavored to find the cause of unapparent infections in the mother that are recognized only by serological tests and other laboratory examinations They inoculated rats between the sixth and eleventh day of gestation with Rickettsia prowazeckii, the causative agent of epidemic typhus an unapparent disease in rats and noticeable only by seroagglutination (at 320), and the presence of rickettsias in peritoneal smears The rats were killed on the twenty first day of gestation One day prior to delivery, experiments showed a large number of abortions, or rather resorption of embryos Abortion did not occur in the controls, who had an average of nine fetuses against 3 9 for inoculated animals A cleft palate (similar to that induced by avitaminosis B) was noted in one of the inoculated embryos, the authors thought it due to infection This anomaly has, hitherto, never been observed either as spontaneous or hereditary The authors believe that the high incidence of abortion and growth impairment of the embryos in these experiments indicates that, in women, clinically latent diseases may have serious consequences for the fetus Prof R Debré pointed out that in some quarters it is believed that lesions of embryos may be due to the presence of antibodies developed in the mother

Circulatory Disturbances in the Genesis of Congenital Malformations—P Lombard (Algiers) studied this problem for the first time and concluded that all so-called amniotic malformations result from a cicatricial process, itself evidence of a prior ischemic necrosis Spasm of a large vessel may interfere with the circulation of a limb, resulting in 'amniotic amputation Certain atresias of the colon and small intestines and anorectal malformations may be due to a similar phenomenon Prof Courrier observed similar necrotic phenomena in animals His pupil A Jos of the faculty of sciences, is conducting experimental research on vascular spasm related to the posterior lobe of the pituitary Lombard stresses the necessity of biologic research to determine at what period of intrauterine life these vascular disorders may occur The coincidence of an emotional episode in the mother with a fetal malformation may be explained by a sudden discharge of pituitary and adrenal hormones A systematic study of the mother s hormonal secretions may lead to a means of preventing congenital malformations

Blood Incompatibilities and Mental Retardation—P Desclaux, A Soulairac, and Mlle Morlon resumed the study of rhesus incompatibility on a series of more than 100 retarded persons and extended it to ABO and MN factors Forty-four cases of incompatibility were noted, whereas there were only 23 in a control population Only a small number of incompatible children showed neurologic syndromes

ISRAEL

Problems of Tropical Medicine in Israel—In a lecture delivered before the Jerusalem Branch of the Israel Medical Association, Dr M Yoeli of the Hebrew University Medical School stressed the increasing importance of tropical diseases as a serious menace to the health of the population in Israel In his lecture, "Antibiotics in Tropical Medicine," he gave a historical review of the development of the antibiotics and their place in the treatment and prophylaxis of some endemic and epidemic diseases of the warm climates He showed, with diagrams and charts, that, although antibiotics have revolutionized the treatment of a few tropical diseases, such as typhus, brucellosis, and some spirochetal infections, the bulk of infectious diseases caused by protozoa or worms and most of the small virus infections have not been affected Dr Yoeli suggested a more cautious and critical approach to the evaluation of new chemotherapeutic agents and antibiotics and hoped to see more prolonged observations on the true value of many 'drugs of choice "

Reviewing some research work on antibiotics performed in the department of parasitology of the Hebrew University, by Prof S Adler and his associates, Dr Yoeli gave an account of the excellent results obtained with terramycin in Mediterranean tick-borne relapsing fever

Until the introduction of terramycin no specific drug was available in infections caused by Spirochaeta persica, the causal organism of Mediterranean relapsing fever The disease, which is endemic throughout the Near and Middle East, may produce one to 16 attacks, tends to be severe and neurotropic, and may involve the eye In rats subjected to splenectomy, the curative dose of terramycin, by intraperitoneal injection, was found to be about 40 mg per kilogram of body weight Animals cured during the patent period show no residual brain infection The residual brain infection can be eradicated by 60 mg or more per kilogram of body weight within 50 to 100 days after the termination of the patent infection Cures are achieved by oral medication with doses of 200 mg per kilogram of body weight In five human cases of relapsing fever, eradication of the infection was achieved with oral doses of 3 gm daily for five days

Encouraging results were obtained with terramycin in experimental infections of local leptospirosis The reservoir of the infection is the local Palestine vole, Microtus gunteri The organism was isolated from the vole and from humans and identified as Leptospira geffen (Olejnik and Shneyerson, *Nature* 166 526 [Sept 23] 1950) In a large number of experiments, terramycin showed specific therapeutic and prophylactic action

Textbook descriptions of tropical diseases are at variance with clinical and field observations in epidemiology and vectors in the Mediterranean area (Near and Middle East) In this vast region stretching from Cyprus toward Asiatic Russia, specific epidemiology of many tropical diseases has been observed During World War II, medical officers of the Allied Armies had ample opportunity for study, they ascertained that knowledge gained in London, Amsterdam, and New Orleans differed from the picture they saw in the Near and Middle East.

The mass immigration of Jews from backward eastern countries to a country that has many potential vectors has brought the problem of tropical diseases to the fore The establishment

---

The items in these letters are contributed by regular correspondents in the various foreign countries

of a postgraduate school of tropical medicine is of utmost importance The departments of bacteriology and parasitology of the Hebrew University and the different clinical departments of the Hebrew University Medical School have been doing a great deal of research work on the various aspects of tropical medicine within their region Some important contributions on the epidemiology of different insect borne diseases have been made by the Hebrew University Within the Medical Faculty of Jerusalem, there is a strong nucleus of scientists that could form the framework of a school of hygiene and tropical medicine to serve Israel and the whole Near and Middle East

Congress for the History of Medicine and Natural Sciences in Israel.—The second Congress convened in Tel-Aviv in May, 1951, under the chairmanship of Prof Bodenheimer, Jerusalem, and in the presence of many guests from other countries The main speaker was Dr S Munther, who spoke about the Jewish Persian physician Ibn Sinai, known in the literature under the Latin name of Avicenna Ibn Sinai, who greatly influenced medicine of the Middle Ages, was born just a thousand years ago The most important work of Ibn Sinai is the "Canon Avicennae," which is the only great printed medical work of that time, it was published in Naples in 1491 All other medical works of that period were handwritten

Dr J Leibowitsch spoke on the importance of the physician Sacutus Lusitanus, who had translated Dioscorides into Latin He himself was a Maranno of Portuguese descent, who, expelled from his homeland, was converted to Judaism and then practiced medicine at Ragusa

An interesting discourse about popular medicine among the Hassidim (orthodox Jews) was made by Dr Margalit Dr Plaschkes spoke on the importance of Thomas Hodgkin, who was physician to Sir Montefiori Within the course of the congress, the grave of Hodgkin, who died at Jaffa in 1866, was visited The graves of Dr Max Nordau and Dr Saul Czernichowski, two distinguished physicians of the early Zionist era, were also visited

The congress adopted a resolution to publish a quarterly periodical in Hebrew The next International Congress of the History of Medicine, in 1953, may convene in Jerusalem

SPAIN

Congress of the Society of Gerontology—The first Congress of the Spanish Society of Gerontology was held in Barcelona in June, 1950 Dr A Pedro y Pons, professor of internal medicine at the University of Barcelona, presided, and the attendance of over 300 was unexpectedly large for a nation with a relatively small number of medical schools Dr R Navarro Gutierrez (professor at the National School of Phthisiology) and Dr J L. Alvarez Sala (assistant professor in the faculty of medicine), both of Madrid, reported on pulmonary tuberculosis in the aged Some of their conclusions follow

Conditions in the aged that influence the course of tuberculosis include circulatory, renal, and hepatic affections, intermediate metabolic processes, and lowered immunity In the aged, the forms of tuberculosis are, on the whole, similar to those found in other periods of life Greater accuracy in diagnosis as well as wider use of the latest therapeutic resources is desirable In principle, there is no contraindication to the use of modern therapeutics in the aged. It is, however, necessary to judge the indications with extreme care, after first carefully studying all vital systems and organs

The large number of aged patients with the chronic forms of pulmonary tuberculosis raises an important social problem Senile tuberculosis may cause disablement before the compulsory retirement age is reached so that it is extremely desirable that suitable legislation be studied in this connection

Public health bodies must be required to give special attention to the problems of senile tuberculosis, since such chronic forms are generally open and represent one of the greatest sources of danger in the spread of the disease. Special institutions should be set up to study and control tuberculosis in older persons It would also be useful from the viewpoint of geriatric science to have one or more sanitariums exclusively for aged tuberculous patients The Spanish Society of Gerontology should request a seat on the Disabled Persons' Trust and must work to spread knowledge among physicians concerning senile tuberculosis

The second official discussion, led by Prof C Blanco Soler of San José y Santa Adela Hospital, Madrid, dealt with diabetes mellitus in the aged Prof Blanco Soler emphasized the mildness of senile diabetes and the advisability of prescribing rather liberal diets, whenever there are no complications (those prognostically unfavorable for aged diabetics, e g , infections, vascular and renal sclerosis, and hypertension

The third discussion, in which Drs M Pañella Cases (chief of the geriatric department of Nuestra Señora de la Esperanza Hospital, Barcelona) and J Monteys Porta (from the same hospital) were the moderators, dealt with senile osteoporosis Following are some of the conclusions that were drawn Senile osteoporosis is a generalized osteopathy, of a rarefying kind, characterized by the decrease and thinning of the osseous trabecula with widening of the medullary spaces The primary disorder consists of insufficient formation of the protein matrix with persistent reabsorptive phenomena The confusion of terms and concepts that exists in the literature on this subject must be resolved The name osteoporosis has been given to such different processes as osteomalacia and fibrous osteosis This must be avoided, as well as the use of other inaccurate terms, like decalcification, deossification, atrophy, osteolysis, and halisteresis, which have been applied to the process under discussion

The pathological anatomy of senile osteoporosis is in no way different from that found in other osteoporizing processes (Cushing s syndrome, menopause, hypogonadism, and adaptation syndrome) The macroscopic pathological anatomy of senile osteoporosis differs from the above processes only in that the so-called fish vertebras—frequently described as characteristic lesions of osteoporosis in general—are not often found This is probably due to the fact that, in the aged, the intervertebral disc loses its capacity for expansion and thus causes a sinking of both vertebral platforms

Senile osteoporosis is commonest in women Postmenopausal and senile osteoporosis seem to be the same process Senile osteoporosis is an involutive process, but hormonal factors probably influence the time of its appearance and its intensity It does not seem to be related to any disturbance of mineral metabolism or to lack of vitamin D, nor is there any proved connection with any disturbance of protein metabolism Vitamin C, which seems to play a part in the formation of collagenous material, may have some effect on the defective formation of the protein matrix, though lack of vitamin C is not a crucial factor in senile osteoporosis

Senile osteoporosis may be asymptomatic, but its clinical manifestations are usually those of the spinal lesions, i e , kyphosis, rigidness, and rachialgia, and various lesions of the kind wrongly called spontaneous The clinical picture, however, is not characteristic Osteoporosis is painless in itself, but there may be pain from vertebral complications

The diagnosis is still primarily radiological Tests for calcium, phosphorus, and phosphatase levels are not valuable diagnostically, except in the exclusion of other rarifying osteopathies, which cause obvious changes in one or several of these biochemical constants The most important and difficult differential diagnosis is senile osteomalacia

Treatment is uncertain and aimed at relieving pain, correcting deformities, and restoring the bone to normal by promoting trabecular formation Treatment with phosphorus, calcium, and vitamin D does not seem to be sufficiently efficacious As in other types of osteoporosis, treatment with steroid substances proves useless Senile osteoporosis seems to be a nonreversible process, but, in general, the less advanced the course and the more acute the onset, the more it improves with treatment Preparations of amino acids and vitamin C should be given The treatment of the pain is rest and that of the deformity must be orthopedic

The congress opened with a lecture by Prof A Pedro y Pons on senile encephalopathy It closed with a lecture by Prof G Marañon, professor of endocrinology in the University of Madrid, entitled "From Climacteric to Senility"

CORRESPONDENCE

CHANGE IN SIZE OF MEDICINE BOTTLES

The Editor of THE JOURNAL *has been requested by the Council on Pharmacy and Chemistry to publish the following letter and to request the readers of* THE JOURNAL *to inform the Council office of their experiences Such correspondence should be directed to Dr Robert T Stormont, Secretary of the Council on Pharmacy and Chemistry American Medical Association, 535 N Dearborn St , Chicago 10* —ED

To the Editor —During the last few years a tendency has developed for pharmaceutical houses to increase the size of eye, ear, nose, and throat medicine dropper bottles from ¼ oz. to ½ oz. and 1 oz This tendency, in my opinion, not only is a hazard to health but also results in increased cost

Treatment for most eye, ear, or nose diseases requires only ¼ oz. (6 to 7 cc) of medication If that amount does not cause considerable improvement, the treatment should be changed I prescribe only such small amounts, but too many may use 1 oz. size bottles At least ¾ oz of the prescribed medicine will be left over, to be used again or to be distributed to friends in the neighborhood for similar conditions, constituting a health hazard I saw a patient for whom a practitioner prescribed sulfonamide solution for acute conjunctivitis which cleared up in two or three days One of the patient's friends had an acute attack of glaucoma four months later This woman used the sulfonamide for four days, until the pains became intolerable Had the first patient not had such a large amount of these drops to go to waste, the second patient might have come to the doctor for proper treatment without losing any valuable time

There is also the possibility that an infection may be carried from one patient to another by the use of the same dropper and bottle This applies not only to eye diseases but to ear and nose diseases as well

I would like to call the fact of the increase of the size of the original bottles to the attention of the Council of Pharmacy and Chemistry It might be worth while to give this some serious consideration and advise the pharmaceutical houses to bottle the medication in ¼ oz containers

ALKALOSIS AND HYPERVENTILATION

To the Editor —In the July 21, 1951, edition of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, page 1125, in the article on "Alkalosis Due to Hyperventilation the authors, Sattler, Marquardt, and Cummins, state, "A review of the literature reveals no clinical reports of hyperventilation alkalosis " In the April 22, 1922 (page 1193) edition of THE JOURNAL, I described several cases of hyperventilation alkalosis in an article entitled Clinical Tetany by Forced Respiration In the June, 1920, edition of the *American Journal of Physiology*, Grant and I first described the production of tetany by voluntary hyperventilation

DIAPHRAGMATIC FLUTTER

To the Editor —I wish to comment on the patient with diaphragmatic flutter described by Dr Wallie L Craddock in the August 4 issue of THE JOURNAL, page 1315 To add to his list of hospitalizations, he was in the Massillon Ohio, State Hospital in the latter half of 1947 or early half of 1948, and known as John Allen He had been committed following disturbed behavior while under observation for a ' heart attack in a Warren, Ohio, hospital He claimed to be a retired merchant seaman, and he was quite interested in flowers and working in the greenhouse The spring of this year he was in Chicago State Hospital

I would like to raise the question of whether his attacks are a matter of malingering as some physicians are inclined to assume My conjecture is that they represent hysteria and that the flutter is a diaphragmatic equivalent of a hysterical convulsion They are precipitated by emotional crises, and the resulting hospitalizations may be considered as "secondary gain " The "various theatricals' and belligerency in temper tantrum like episodes suggest a hysteroid personality It is unlikely that the diaphragm can be moved as rapidly as 200 times a minute under the direct control of will, as would be the case in malingering Personality studies, such as the Rorschach test, might throw considerable light on this case

VASOPRESSIN INJECTION (PITRESSIN®) AND THE INTESTINAL TRACT

To the Editor —The reason for the experience of Drs Slotnik and Teigland (Cardiac Accidents Following Vasopressin Injection [Pitressin®], *J A M A* 146 1126 [July 21] 1951) can be sought in the fact that 20 units of pitressin® were injected We regard it as a better policy to follow the advice of Goodman and Gilman, who in their textbook ' The Pharmacological Basis of Therapeutics" recommend doses of 5 to 10 units to achieve the desired effect on the intestines

The danger of excessive doses of this substance lies not only in the possibility of creating disturbances of the coronary circulation I saw Cheyne Stokes respiration after administration of a postpituitary extract, and I witnessed the reaction of an infant who received 5 units A prolonged period of apnea with deep cyanosis and unconsciousness left a lasting impression which one would not wish to invite again

If a dose of pitressin® greater than 10 units is necessary for expelling gas from the intestines before cholecystography, the use of the drug in this diagnostic procedure should be abandoned The kidney function test using postpituitary extracts which I introduced in 1921 has since been performed by many investigators without untoward side effects This latter test, however, can be satisfactorily performed with 10 units or less (Pasqualini, R Q Tubular Resorption Test With Results Obtained in 19 Cases of Acute Nephritis, *J Lab & Clin Med* 30 51 [Jan] 1945)

PLASMA L E. TEST IN LUPUS ERYTHEMATOSUS

To the Editor —In the editorial entitled "Plasma L. E Test in Lupus Erythematosus" (*J A M A* 146 819 [June 30] 1951) it is stated that Hargraves 'conceived the idea" of the plasma L E test and that ' Haserick made the same observation one year later While not wishing to detract from Dr Hargraves' splendid contribution in this field, I would like to point out that the editorial omitted the following two articles by Haserick and Bortz which were prepared prior to the appearance of Dr Hargraves paper on April 27, 1949 (*Proc Staff Meet Mayo Clin* 24 234, 1949) (1) Normal Bone Marrow Inclusion Phenomenon Induced by Lupus Erythematosus Plasma" (*J Invest Dermat* 13 47, 1949) submitted for publication March 25, 1949, and (2) "New Diagnostic Test for Acute Disseminated Lupus Erythematosus" (*Cleveland Clin Quart* 16 158, 1949) submitted to THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION on April 20, 1949

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ABSTRACTS

Compensation of Physicians Divorced Husband's Liability for Services to Child.—The plaintiff dentist sued to recover a sum of money alleged to be the reasonable value of dental services rendered to the defendant s minor child at the request of the child s mother, who is defendant's divorced wife and to whom custody of the child had been awarded by virtue of the divorce decree From a judgment in the trial court in favor of the plaintiff, the defendant appealed to the St Louis court of appeals, Missouri

The child was born with a harelip and cleft palate which required surgical care and prior to the divorce the parents entered into a separation agreement by the terms of which the defendant agreed, among other things, to pay all the costs and expenses of any additional operation or operations that might be necessary on account of the child s deformity and to pay the sum of $15 a month for the child's maintenance The divorce decree also fixed the defendant's obligation for the child s maintenance at $15 a month

The plaintiff specializes in dental work for children, and the child in question was referred to her by the surgeon who had performed the operation to repair the harelip condition Thirteen cavities were filled and an abscessed tooth treated and the trial court found that the work the plaintiff did was necessary and her charges reasonable The defendant did not know the plaintiff and had had no communication with her respecting the work she did for his son In fact, the first information he had regarding plaintiff's connection with the case was when he received a bill for her services in January, 1949, almost a year after the services were rendered

The defendant argued that the decree of the divorce court requiring him to make monthly payments for the maintenance of the child was conclusive upon the extent of his obligation for the child s support until such time as the decree might be modified, and that the whole theory and purpose of a fixed award would be defeated if either the mother or a volunteer should be permitted to impose a liability upon him other than that imposed by the decree If this action had been brought by the child's mother to recover for money she had personally expended in obtaining dental services for the child, said the court, it might well be argued that in such controversy between her and defendant, the provision made by the court's decree should be regarded as having fixed the measure of the defendant s liability to her for the child s maintenance, and that if the payments required by the decree were inadequate, her remedy, before making any expenditure, would have been to apply to the court for a modification of the decree upon the showing of a change in the child's condition which had made it necessary that dental services be procured However, this action is by the dentist rendering the services She is not a party to the decree and is therefore in no sense concluded by it Neither is plaintiff entitled to any possible benefit to be derived from the terms of the separation agreement, which was purely a contract between the parents of the child

If the plaintiff is to recover in this action, said the court, it must be solely on the strength of defendant's common law liability A father's liability to a third person for necessaries furnished his minor child is not affected by the fact that the custody of the child has been awarded to the mother His liability is founded upon the theory of authorization, and in the absence of an express promise to pay, there must be a showing of circumstances from which a promise may be implied Except for an emergency which renders a third person s immediate interference both reasonable and proper, an implied promise to pay for necessaries must depend upon the father's failure or refusal to supply them, and where he is ready and willing to make suitable provision for his child there can be no recovery by a third person who has furnished the necessaries without his express authority In other words, the basis of the father's liability is his omission to fulfill his obligation of supporting his child, and a stranger who furnishes articles or renders services to the child does so at the peril of being able to show that they were furnished under such circumstances as to have imposed a duty on the father to pay for them Consequently the volunteer who undertakes to recover from the father has the burden of establishing not only that the articles furnished or the services rendered were in fact necessary, but also that the father had been guilty of a manifest dereliction in failing to supply them Here any such evidence is entirely lacking, said the court While it would doubtless not be contended that the services which plaintiff rendered did not fall within the category of necessaries, there is nothing to indicate that the child s need for such services had ever been brought to the defendant's attention, or that he had been given any opportunity whatsoever to see that proper provision be made, as, for instance, by the selection of a competent dentist of his own choosing in his own locality Instead it was an admitted fact that the first information he had of the matter was when he received the bill from the plaintiff long after the services had been performed Under such circumsances there was a failure of proof upon the fundamental ground of liability

Accordingly the judgment of the trial court in favor of the plaintiff dentist was reversed —*Thompson v Perr 238 S W (2d) 22 (Missouri 1951)*

Malpractice Failure to Diagnose Fracture.—The plaintiff filed suit against the defendant physicians for damages for alleged malpractice resulting in injury to her leg From a directed verdict in favor of the defendants and a judgment overruling the plaintiff's motion for a new trial, the plaintiff appealed to the court of appeals of Georgia, division number 2

The plaintiff fell down while at work in the apartment hotel in which she lived One of the defendant physicians diagnosed her injury as a strained muscle, put her to bed and gave her capsules to relieve her pain The pain persisted about two weeks, however, and at that time she was x rayed and found to have suffered an impacted fracture of the left leg She was then placed in a cast which she wore for some time The end result was that the plaintiff suffered an absorption of the neck of the femur, resulting in a fibrous union at the site of the fracture and a definite shortening of the left leg The plaintiff contended that this result was caused by the defendants in improperly diagnosing her condition and in failing to take x rays

The counsel for the plaintiff contended that there was both lay and medical testimony as to the negligence of the defendants The record, said the court, does not bear out this contention The testimony of the medical witness for the plaintiff indicated that the result of the defendants treatment of the plaintiff was that which obtained in about 20% of similar cases and that medical science does not yet know how to prevent such results This was a question solely for expert medical evidence A layman may testify as to results, but not as to whether treatment given in a particular case constitutes a failure on the part of physicians to use care and diligence Since the results suffered by the plaintiff was the same as that which is obtained in 20% of all such cases regardless of any negligence on the part of the physician, the court was of the opinion that the trial court was correct in directing a verdict in favor of the defendants unless some of its special rulings relating to admissibility of evidence were wrong

The plaintiff contended that the trial court erred in sustaining an objection by counsel for the defendants to questions propounded by the counsel for the plaintiff to the plaintiff's medical witness as to whether in his opinion it was advisable for a surgeon treating a fracture of the hip to wait two weeks before taking an x ray We think the objection was correctly sustained The issue was whether the treatment given the plaintiff by the defendants measured up to the standards of care and skill ordinarily employed by the profession generally under similar conditions and like surrounding circumstances It was not a question of what one individual doctor thought was advisable

Accordingly the judgment of the trial court directing a verdict in favor of the defendant physicians was affirmed —*Mayo v McClung, 64 S.E (2d) 330 (Georgia, 1951)*

Medical Practice Acts· Limitations on License Revocation — The Connecticut Medical Examining Board, after a hearing on complaint of the State Commissioner of Health, revoked the plaintiff's license to practice medicine From a judgment of the trial court in favor of the plaintiff, an appeal was taken to the Supreme Court of Errors of Connecticut

The plaintiff's basic claim is that the recommendation of the medical examining board revoking his license was illegal because the board exceeded its authority The statute in effect when the commissioner of health filed his complaint listed as grounds for the revocation of license, among other things, immoral, fraudulent, dishonorable or unprofessional conduct and illegal incompetent or habitually negligent conduct in the practice of the healing arts This enactment, said the court, was at once a grant and a limitation of power The board was authorized to act upon any one of the enumerated grounds, but it was limited, by the failure or refusal of the legislature to add others, to those specified

In the present case the plaintiff was subjected to a hybrid accusation He was charged, in part, with "wanton negligence' in the practice of his profession This charge, said the court, finds no sanction whatsoever in the statute Whether wisely or not, the legislature has made but one form of negligence a ground for revocation This is negligence which is characterized as habitual All other forms, whether they are described as wanton, gross, heedless or reckless, are excluded from the statute by implication The board was as unwarranted in finding the plaintiff guilty of wanton negligence as was the commissioner in making the charge

The charge of wanton negligence was not set forth independently but was linked with one alleging 'fraudulent, dishonorable, unprofessional and immoral conduct ' Five counts were involved The board found the subordinate facts as to each and then reached the following conclusions (1) The plaintiff was "guilty of having treated Mrs Everett Brady in a ruthless and wantonly negligent manner", (2) he was "guilty of negligence in his care and treatment of Mrs Everett Brady and her infant son", (3) he was ' guilty of treating James Nally in a careless and negligent manner and to his detriment", (4) he was ' guilty of treating Mrs Arthur Gordon in a cruel, and grossly negligent manner and to her detriment", and (5) he was "guilty of rendering careless and improper medical treatments to Mrs Everett Brady and her infant son ' The significance of this recital, said the Court of Errors, lies not in what it contains but rather in what it omits No reference is made to unprofessional conduct This omission acquires added significance from the board s statement, incorporated in its finding, that in arriving at a decision it considered ' each count and allegation separately and independent of all other counts and allegations " If this statement is accepted, continued the court, as it should be it follows that the board was unable to conclude that the plaintiff was guilty of unprofessional conduct on any one of the counts, when considered separately Nevertheless, at the very end of its finding, the board records that its members ' are in unanimous agreement that the Respondent is guilty of dishonorable and unprofessional conduct " This conclusion must, then, have been reached through the cumulative effect of the findings on all the counts Therein lies the impropriety of the board's action, said the Court of Errors As we have pointed out, the findings of guilt based on negligence, characterized as gross, wanton or otherwise, were unlawful In using them to reach a conclusion of guilt on the charge of unprofessional conduct, the board acted illegally

A complaint by the department of health need not be phrased with the precision of a well-drafted pleading It must, however, be based on the statute Nor need a hearing before the board be marked with the formality with which a judicial trial is conducted It is sufficient if he who is under charges has a reasonable opportunity to hear and be heard on them and if the proceedings are conducted in a fair and impartial manner The informalities to which we refer in this case, however, must not be permitted to prejudice the rights of parties

Accordingly the judgment of the trial court disapproving the order of revocation made by the board of medical examiners was affirmed —*Adam v Connecticut Medical Examining Board, 79 A (2d) 350 (Connecticut, 1951)*

MEDICAL MOTION PICTURES

Laboratory Diagnosis of Diphtheria. Parts I II III IV 16 mm. black and white sound Produced in 1950 by and procurable on loan from Communicable Disease Center 50 Seventh St N E Atlanta 5 and on purchase from United World Films 1445 Park Ave New York 29

Part I *Microscopic Study and Isolation of C Diphtheriae* Showing time 13 min This film deals with the laboratory diagnosis made on the basis of a culture of throat and nasal secretions The techniques of obtaining the material, making smears and cultures, and selection of the culture medium are brought out clearly and systematically The film shows how the laboratory procedure can be only an aid to the physician, because with the most modern technique the information can be furnished in 18 hours at the earliest. In most instances the diagnosis must be made on the basis of what is found by physical examination If the physician delays treatment 18 hours, the patient may benefit little The physician may modify treatment after the report of the culture comes from the laboratory

Part II. *Determination of Types of C Diphtheriae* Showing time 12 min This film shows how the three main types of the diphtheria bacillus are identified This is of considerable epidemiologic importance The value of the macroscopic appearance of the colony is illustrated convincingly, the gross diagnosis of the colony, the hemolysin test, and the fermentation tests complete the identification of the type

Part III *Testing for Virulence in Animals* Showing time 13 min This film deals with the virulence test, performed preferably on rabbits Here again, the procedure is brought out clearly A good example of how rabbits should be handled is shown Laboratory technicians could profit from this particular phase of the film The occasional use of guinea pigs and of chicks is also illustrated

Part IV *The In Vitro Virulence Test for C Diphtheriae* Showing time 12 min This film presents in great detail the in vitro virulence test

These four films give all that one needs to know about the techniques of the laboratory diagnosis of diphtheria, of the typing of the diphtheria bacillus, and of the various virulence tests. The films will be of primary interest to bacteriologists, laboratory technicians, and medical students They will also be of interest to physicians and nurses as a part of their general education The physicians will profit by finding out the limitations of the laboratory diagnosis of diphtheria Many pages of printed material and/or lectures could not possibly furnish the same amount of information as convincingly as this series The photography and narration are excellent, and the films are very well organized

Chick Embryo Techniques: 16 mm. black and white sound showing time 15 min Demonstrated by G John Buddingh M D Louisiana State University School of Medicine Produced in 1951 by and procurable on loan from Communicable Disease Center 50 Seventh St N E. Atlanta 5 or on purchase from United World Films 1445 Park Ave New York 29

The chick embryo is a very useful medium for culturing It is highly specialized and has no rival in its specific field of usefulness This film gives the complete technic of the procedure all details are presented clearly The physician and medical student will get a convincing demonstration in the shortest possible time It can be recommended without reservations as meeting all the requirements of teaching a specialized procedure It will be of interest to technicians, research investigators, and physicians in general and can be used advantageously in bacteriology courses The photography and narration are excellent

SOURCES OF MOTION PICTURES ON HEALTH

A revised list of "Sources of Motion Pictures on Health" has been prepared by the Committee on Medical Motion pictures This new mimeographed list includes nine pages of addresses of the major loan and rental libraries, the state health departments film libraries, and references to printed lists and catalogs. Copies are available from the Committee on Medical Motion Pictures, American Medical Association, 535 N Dearborn St, Chicago 10

MEDICAL LITERATURE ABSTRACTS

Progesterone in Dermatoses of Pregnancy.—Ten women between 21 and 40 with polymorphic eruptions during pregnancy were studied The onset of the dermatosis was during the first trimester of pregnancy in two patients during late pregnancy in seven and 24 hours post partum in one There had been a total of 20 previous pregnancies among these patients, yielding 14 living children (a fetal mortality rate of 30%) One delivery was premature Four of the 10 patients had experienced the dermatosis with previous pregnancies During the pregnancy under consideration five of the 10 patients had moderate to severe edema and four had albuminuria Persistent headache, red blood cells in the urine, and hypertension were observed in three patients The level of blood chorionic gonadotropin in seven patients was abnormally elevated during late pregnancy, averaging 3,125 rat units per 100 ml of blood as compared to the normal level of 500 to 750 rat units per 100 ml Since the demonstration of excess chorionic gonadotropin in later stages of pregnancy has previously been shown to be associated with decreased production or aberrant metabolism of progesterone, substitutional treatment with progesterone (proluton®) in doses of 25 to 50 mg daily was practiced Remission of the skin lesions resulted in all 10 patients All 10 pregnancies resulted in living normal infants There was one instance of premature delivery at eight months with fetal survival The observation of elevated chorionic gonadotropin titers in late pregnancy and the response to treatment with progesterone are suggestive of progesterone deficiency in patients with dermatoses during pregnancy

Antibiotics in Early Syphilis.—Of 166 patients with early syphilis 127 were treated with penicillin 14 with chloramphenicol (chloromycetin®), 20 with aureomycin and five with terramycin Of the 127 patients treated with penicillin 56 had dark field positive lesions of early syphilis and 71 had early syphilis complicated by pregnancy Ten different schedules of treatment with penicillin were used Of 43 patients who were scheduled to be treated once weekly for 35 weeks with intramuscularly administered penicillin only eight completed the course Of 13 out patients treated with buffered penicillin tablets daily for 15 days only two completed the required amount of treatment, and neither of these achieved a satisfactory result Carinamide administered concurrently to 27 patients receiving penicillin orally or intramuscularly did not enhance the value of the penicillin Of the 56 patients with uncomplicated early syphilis, 14 had negative results of blood and spinal fluid examination six months after completion of penicillin treatment Of the 71 patients with early syphilis complicated by pregnancy who were treated with penicillin, 62 gave birth to normal infants and nine to infants with congenital syphilis The mothers syphilis was improved in 22 instances and there was no change in 49 Of the 14 patients treated with chloramphenicol the dark field observations became negative in eight within 24 hours and in the rest in 48 to 72 hours Ten of these patients completed the preliminary six months follow up period, and seven of them became seronegative and had negative results on spinal fluid examinations Two pregnant women with early syphilis treated with chloramphenicol were delivered of nonsyphilitic infants Of the 20 patients treated with aureomycin 10 received the drug by mouth and 10 by intravenous route With the oral treatment the dark field observations became negative in 18 to 72 hours The lesions healed in seven to 12 days in all 10 Three of the patients completed the preliminary six months observation period and became seronegative and had negative spinal fluid reactions Of the 10 patients treated intravenously, eight completed the preliminary six months follow-up period three of these became seronegative and had negative results of spinal fluid examination three showed a decided drop in the serologic titer and two were lost sight of The lesions in this group healed in seven to 14 days Further studies must be done to determine an optimum dose The five patients treated with terramycin had negative dark field observations 24 to 32 hours after the institution of treatment The lesions healed in from seven to 12 days

Surgical Treatment of Pulmonary Stenosis—Stenosis of the pulmonary valve is the only important abnormality in some patients with cyanosis due to congenital heart disease This abnormality sometimes called pure pulmonary stenosis, differs from that seen in typical tetralogy of Fallot in that the interventricular septum is intact and consequently there can be no overriding of the aorta Stenosis is caused by fusion of the cusps of the pulmonary valve Dilatation of the pulmonary artery is usually found immediately distal to the stenosis The only other

The Association library lends periodicals to members of the Association and to individual subscribers in Continental United States and Canada for a period of five days Three journals may be borrowed at a time Periodicals are available from 1940 to date Requests for issues of earlier date cannot be filled Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested) Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order Reprints as a rule are the property of authors and can be obtained for permanent possession only from them

An asterisk ( ) before a title indicates that the article is abstracted lesion often seen in these hearts is a patent foramen ovale, which serves as an escape valve into the left auricle for blood dammed back in the right auricle The size of this shunt determines the degree of cyanosis There may be dyspnea and decrease of exercise tolerance with relatively little cyanosis The heart is enlarged There is usually a systolic murmur Whereas in the tetralogy of Fallot satisfactory results are obtained by shunt operations between the subclavian and the pulmonary artery or the aorta and the pulmonary artery, the most satisfactory operation for the stenotic pulmonary valve is transventricular valvulotomy The valvulotome used by the authors consists of a small cataract blade on a rounded shaft attached to an ordinary knife handle The rounded shaft was made of such size that it would fill the opening in the wall of the right ventricle and thus prevent loss of blood Although this valvulotome proved successful in four patients, it was feared that it might fail to relieve the obstruction in older patients with more rigid valvular stenosis The principles of the expanding blade used by urologists and of the adjustable esophageal dilator used by endoscopists were drawn on in devising an expanding valvulotome and dilator The valvulotome is so constructed that the blades can be retracted by means of a turn screw while the instrument is being thrust through the wall of the ventricle An important feature is the gage that indicates exactly how widely the blades of the knife are being expanded while in the chamber of the right ventricle preparatory to the thrust through the stenotic valve The shaft of the dilator is the same caliber as that of the valvulotome and is introduced through the same hole in the right ventricle after the valvulotome has been withdrawn Because reduction of temperature lessens the consumption of oxygen during the operation and thereby reduces the danger of disastrous anoxia, the patient is placed on a water mattress through which ice water is circulated The authors performed valvulotomy in 13 patients, one of whom died In the other 12 patients, the results have been excellent in 11 and fair in one

Surgical Treatment of Familial Polyposis.—Malignant degeneration may be expected in familial polyposis of the colon, if it is allowed to progress untreated The symptoms and signs of this disease include bowel irregularity, diarrhea, the presence of mucus and blood in the stool, and abdominal cramps and tenesmus Any of these should warrant a digital rectal examination and a proctosigmoidoscopic examination, at which the polyps may be seen under direct vision and tissue removed with the biopsy forceps from suspicious areas for microscopic section Sometimes proctosigmoidoscopic examination will not reveal any suggestive lesion, and then the contrast enema must clinch the diagnosis and demonstrate the extent of the disease Ascorbic acid and blood transfusions are helpful in preparing patients with polyposis of the colon for operation Partial or total colectomy is the procedure of choice An end to-end anastomosis between the terminal portion of the ileum and the distal 3 cm of the sigmoid over a rubber tube reduces the number of suture lines to a minimum, provides adequate decompression proximal to the suture line, thus removing intraluminary tension and accelerates the rate of wound healing by its splinting effect The anastomosis should be carried out prior to the surgical removal of the colon Although the major branches of the superior mesenteric artery must be ligated individually, the trunk of the inferior mesenteric artery can be ligated close to its aortic origin The one stage procedure permits surgical treatment at the optimum time, and the remaining rectal segment can be checked and other polyps destroyed by fulguration through a proctoscope The author reports on two families with polyposis whom he has treated In each case a parent and two siblings were involved

Paravertebral Lumbar Sympathetic Block in Labor—Continuous lumbar sympathetic conduction anesthesia is produced by fractional dosages of 1% procaine solution with reinjections as needed throughout labor The solution is deposited bilaterally at the anterior surface of the first lumbar vertebral body Only one needle is inserted on each side, and this is removed following the original injection, after a fine plastic catheter has been placed through its lumen These tubes serve to carry the anesthetic solution to the area as often as necessary A limited part of the autonomic nervous system, namely, a segment of the lumbar sympathetic chain and ganglions containing afferent and efferent fibers to the uterus, cervix, and vagina, is blocked The anesthetic does not come in contact with the spinal somatic nerves, the spinal canal, or the epidural, subdural or vertebral foramina areas Contrary to other regional conduction methods (epidural or subarachnoid) used in obstetrics, in which pathways containing mixed nerve structures are bathed by the cocaine derivatives, this method limits its action to the sympathetics The muscular contractions of the abdominal muscles in the second stage of labor are not impaired, but inasmuch as the innervation of the lower parturient canal, comprising the pelvic floor, perineal body, and structures about the introitus, is derived through the somatic nerves, namely the pudendal and iliac inguinal nerves, the sympathetic nerve block will not be effective in blocking painful stimuli from these areas during the final phases of labor A bilateral pudendal nerve block, therefore is used to produce regional anesthesia at these levels However, it is given earlier than is ordinarily the case, namely, in a multipara at about four-finger cervical dilatation, in a nullipara after the onset of the second stage The advantages other than the relief of pain are that the physiological changes occurring during labor in the lower uterine segment and the cervix are enhanced The forces of labor are either increased or at least remain undiminished, and labor is shortened The termination of labor by a spontaneous delivery or by elective perineal forceps may usually be expected The newborn infant breathes deeply and cries immediately after delivery He presents no evidence of anoxemia or massive aspiration of foreign material, unless some unrelated obstetrical problem has intervened The mother is alert, cheerful, relaxed, and cooperative

Continuous Drip Subarachnoidal Block for Labor and Delivery —Continuous-drip spinal anesthesia was administered to 52 parturient women after labor had begun The skin and underlying structures at the level of the third lumbar interspace were infiltrated with 1 ml of procaine hydrochloride (novocain®)-ephedrine solution A spinal tap was then made with a special 18 gage needle and the vinylite® catheter introduced 1 in into the subarachnoid space After removal of the spinal needle, a blunt 23 gage needle was inserted into the distal lumen of the vinylite® catheter and the hub of the needle was closed with a metal plug for the female Luer lok adapter The catheter was then directed transversely across the back of the patient to her side and secured in this position with adhesive tape Immediately following a uterine contraction with the patient in the sitting position, 2 ml of 2 5% procaine solution was introduced slowly from a Luer lok syringe Forty-five to 60 sec after this injection, the patient lay flat on her back until the level of hypalgesia to pin prick extended to the tenth thoracic dermatome The patient was then elevated to a semi recumbent position by raising the back rest to 45 degrees A continuous-drip subarachnoidal infusion of 0 5% procaine hydrochloride was begun at the rate of 3 to 4 drops per minute About 15 to 20 min after the start of the continuous subarachnoid drip, the bed rest was lowered to 15 to 20 degrees Maternal blood pressure and fetal heart tones were checked every 15 min The rate of the subarachnoidal drip was also checked periodically The patient was instructed to bear down" synchronously with the uterine contractions Before the patient was moved to the delivery table, 50 mg of meperidine (demerol®) hydrochloride was injected intramuscularly The continuous drip was discontinued, and the hub of the needle in the distal end of the catheter was closed with the metal plug Before delivery, it was occasionally necessary to administer another 2 ml of 2 5% procaine solution After delivery and repair the patient was turned on her side, her back was arched and the catheter was removed A dressing was taped over the puncture site By means of this technique, complete pain relief can be afforded early to parturient women without significant interference with the process of labor and delivery

Tuberculous Cavities of Lower Lobe.—Cavitary tuberculosis of the lower lobes has presented a problem in management since the inception of collapse therapy With the newer means of treatment available such as resection, pneumoperitoneum, and streptomycin it was believed that a study of a group of patients with lower lobe cavitary tuberculosis largely treated by the older methods was essential to evaluation of the new methods Lower lobe cavitation accounts for from 20 to 25% of tuberculous cavitation. A group of 103 patients with lower lobe cavitary tuberculosis was collected for study Of these 57 patients had tuberculosis limited to one lower lobe (group A) and 46 had more widespread disease with the lower lobe cavity presenting the principal therapeutic problem (group B) Collapse therapy was used in 97 of the patients the great majority received pneumothorax or phrenic nerve interruption alone or in combination The results of therapy with regard to cavity closure and the patients' status observed at an average follow up period of four and one half years after discharge from the sanatorium did not differ appreciably with the three therapeutic methods The results in the cases with more widespread tuberculosis were poorer than in the unilobar cases particularly when they were treated with pneumothorax The over all results in the series of 103 patients were as follows in 73 patients, the tuberculosis has become inactive in 12, the disease has remained active and in 18 patients the tuberculosis has proved fatal In the 57 patients with tuberculosis limited to the lower lobe the disease has become inactive in 48 patients, remains active in four and has proved fatal in five

Corticotrophin and Cortisone in Asthma and Eczema.—Corticotrophin (ACTH) and cortisone were used in the treatment of three children who had eczema and 10 who had bronchial asthma Their ages ranged from 18 months to 15 years Both corticotrophin and cortisone proved to be potent agents in the temporary relief of chronic atopic dermatitis (eczema) and bronchial asthma Infants and children react to these hormones essentially as do adults, except that they require larger doses in proportion to their body weight The dosage depends on the severity of the disease more than on the age or weight of the child The greater the improvement obtainable by specific management, the less will be the amount of hormone required This is important not only because of the cost of these hormone preparations but also because of their possible deleterious effects over long periods The longest remission in asthmatic children occurred in a boy of 9 who remained symptom free for four months after corticotrophin therapy was stopped The authors believe that without these drugs, 11 patients would have required long periods of hospitalization or would have been obliged to try the uncertain effects of a change of climate However, these drugs are as potentially harmful as they are beneficial and in the present state of knowledge should be used only when absolutely necessary and with the closest supervision

Khellin in Bronchial Asthma —Khellin is obtained from a plant known in Arabic as Khella ' and in English as 'Bishop s Weed ' It belongs to the carrot family, which also includes parsley, parsnip, celery, anise, caraway, and dill After reviewing the recent literature on the synthesis and pharmacology of khellin, the authors recapitulate two recent reports on the use of khellin in asthma and then describe their own observations on 45 asthmatic patients Khellin was administered, in 100 mg doses to 20 patients by the intramuscular route and to 25 patients by the oral route Good or excellent results were obtained in 12 and slight or no benefit in eight of those receiving intramuscular injections of the drug Similarly; of the 25 patients who were given khellin by mouth, 14 had good or excellent results and 11 slight or no benefit Pain at the site of reaction headache, and nausea were observed in some patients One advantage of khellin is its prolonged action Also, it should be particularly useful in asthmatics with concomitant hypertension From the results obtained in this series of 45 patients and in other patients now under observation, it is felt that khellin will have a useful place in the treatment of bronchial asthma

Banthine® in Duodenal Ulcer.—Banthine® (beta-diethylaminoethyl xanthene 9-carboxylate methobromide) was given to 137 patients for periods of two to 12 months All but 20 of these patients had duodenal ulcer, and in most of them the ulcer had proved intractable, 21 having had massive hemorrhages seven obstruction, and nine surgery for perforation The dosage used was 100 mg every six hours for the first two months and then the dose was usually decreased to one tablet (50 mg) with each meal and one or two at bedtime Of the 117 patients, 97 obtained prompt relief, while seven had definite or partial relief Two patients with cicatricial duodenal stenosis became worse while on the medication, so that the drug should probably not be used in patients with obstruction from scarring, it can be used in patients with obstruction due to spasm, edema, and inflammation after a preliminary Sippy type of treatment Two patients had a recurrence of duodenal ulcer while receiving the medication Banthine® proved effective in six of nine patients with the hyperacidity syndrome, in two with marginal ulcers, and in two with peptic ulcers in hiatus hernias but not in four patients with gastric ulcer Thus, while the results in patients wth duodenal ulcer seem to justify further trials with banthine,® the drug is not indicated in gastric ulcer

Aureomycin Therapy in Hepatic Insufficiency —Aureomycin was given as an additional treatment to 14 patients who showed signs of hepatic failure with beginning coma, despite intensive therapy Because they were unable to take oral medication, five patients received aureomycin intravenously every 12 hr, in doses of 500 mg A solution of the drug, in 10 cc of sterile distilled water added to 200 or 300 cc of isotonic solution of sodium chloride or 5% glucose in distilled water, was given rapidly during a period not exceeding 20 min The other patients were given two capsules of aureomycin (500 mg) every six hours The medication was continued in the acute cases until there was improvement and in the chronic cases for 30 to 60 days, even after improvement was shown Eight patients—seven with chronic and one with acute hepatic disease—showed improvement, two patients with chronic disease remained the same, and four patients—one with acute and three with chronic disease—died Two of the initially improved patients returned to the hospital 10 days and two and a half months later respectively, and died despite another course of aureomycin treatment The effect of aureomycin may be due to its detoxifying action on the intestinal flora when given orally and to the action on bacteria in the portal circulation or liver when given intravenously Results with aureomycin to date seem to indicate that it should be given a therapeutic trial in patients with hepatic insufficiency

Corticotrophin and Cortisone in Tuberculosis.—The seven patients who were selected for treatment with corticotrophin and cortisone had far-advanced pulmonary tuberculosis Four of them also had active laryngeal tuberculosis The course of the illness was evaluated prior to hormone administration from clinical, roentgenographic, bacteriologic, and immunologic data Whenever possible, a preliminary observation period of seven to 10 days was undertaken Each patient then received 100 mg of hormone intramuscularly in four equally divided doses at six-hour intervals for an initial 10 day period Four of the patients received corticotrophin, and three received cortisone Throughout the study all patients were kept in bed They received diets of their own selection The changes brought about by the administration of these hormones were defervescence, greater sense of well-being increased strength, improvement in appetite, as well as decrease in the edema and in the amount of exudate in the laryngeal lesions In all patients the improvement was temporary and could not be maintained by further administration of the hormones The signs and symptoms reappeared and were equal to or even more severe than those present before hormone administration Edema and inflammation in the laryngeal lesions also returned promptly The swift return of the manifestations of acute illness contrasted sharply with the relatively slow return of cutaneous hypersensitivity to tuberculoprotein and rise in the titer of the tuberculin hemagglutinating antibodies observed several weeks after cessation of hormone administration It seems clear that reactivity of host tissues sufficient to cause severe symptoms of tuberculous illness may be present without the presence of a positive Mantoux test

The Nephrotic Syndrome in Children.—Children with the nephrotic syndrome" present certain consistent clinical features, but their separation into two groups, nephrosis" and the "nephrotic stage of nephritis," has been arbitrary and frequently difficult This study was undertaken to determine if measurements of renal function would assist in the early differentiation of benign nephrosis from progressive nephritis and if studies of renal function would help to elucidate the pathogenesis of the nephrotic syndrome Estimations of glomerular filtration rates renal plasma flow, and maximal tubular excretory capacity were made in 29 nephrotic children These were a fairly typical sample of a total of 90 nephrotic children recently observed at the clinic at which these studies were made It was found that conventional clinical criteria frequently proved unreliable early in the course of the nephrotic syndrome as indexes of the functional status of the kidney or as guides to the subsequent course of the patient The triad of anemia, acidosis, and azotemia, when correlated with a diminished glomerular filtration rate, indicated incompetence of the nephron for biochemical regulation and probable morphologic damage with poor prognosis Fluctuating changes in glomerular filtration rate, renal plasma flow, and maximal tubular excretory capacity during the nephrotic syndrome suggested that variations in these measurements are a function of the severity and duration rather than type, of disease The biochemical and renal functional patterns indicate that reversible metabolic and hemodynamic rather than irreversible anatomic nephron damage frequently occurs. With progressive disease of long duration greatly impaired renal function suggested that irreversible parenchymal destruction gradually supersedes the earlier physiological changes, with culmination in renal failure The primary etiological mechanism remains undetermined, however, the idiopathic nephrotic syndrome in children, whether called pure or lipoid nephrosis, mixed nephritis, or nephrotic stage of subacute or chronic glomerulonephritis, appears to be a form of nephritis in which functional alteration and eventual anatomic changes indicate that the glomerulus is a primary site of the disease process Spontaneous or induced remissions may proceed to apparent recovery, if the unknown etiological mechanism is inhibited before extensive anatomic damage has supervened

Cardiovascular Syphilis.—The essential pathological change in syphilis of the cardiovascular system occurs in the aorta Spirochetes invade the aorta early (during the secondary stage) and involve the vasa vasorum of the adventitia This interference with blood supply affects the muscular layer Round cell infiltration occurs and eventually there is destruction of the muscle fibers with replacement fibrosis The resulting loss of elasticity of the aortic wall causes subsequent changes, such as insufficiency of the aortic valve, stenosis of the ostia of the coronary arteries and aortic aneurysm While it has been stated that the average duration of cardiovascular syphilis from diagnosis to death is three years this means little in the individual case, each patient must be evaluated individually Factors influencing prognosis include (1) the presence or absence of symptoms of diminished cardiac reserve, (2) the size of the heart, (3) the age of the patient (presence or absence of arteriosclerosis), (4) the type of work performed, and (5) the amount of previous antisyphilitic therapy and when it was given in relation to the discovery of cardiovascular involvement Patients with cardiovascular syphilis respond to the usual cardiac therapeutic measures better than was previously thought There has been much discussion concerning the dangers of antisyphilitic therapy in cardiovascular syphilis The major fear is the Herxheimer reaction (therapeutic shock), in which edema of the aortic wall may occur secondary to the rapid killing of spirochetes This edema may involve the coronary ostia, causing their occlusion, or may weaken a damaged aneurysmal wall, causing it to rupture The authors believe that this hazard has been greatly exaggerated They encountered no adverse reactions in 69 patients with aortic insufficiency and/or aneurysm who were treated with penicillin They favor procaine penicillin in oil with 2% aluminum monostearate It may be given in doses of 600,000 units daily, every other day, or three times weekly, for 10 doses

New Approach to Heart in Cardiac Arrest.—In Wexler and Bromberg s method of reaching the heart in cases of cardiac arrest the left side of the chest is entered by blunt upward burrowing between the deep surface of the posterior rectus sheath and the anterior slip of the diaphragm in a region where the diaphragm is not attached to the costal arch A longitudinal incision cuts the anterior slip of the diaphragm By inserting the fingers and burrowing behind the posterior rectus sheath and in front of the diaphragmatic muscle tissue, one enters the left side of the thoracic cavity without obstruction On entering the chest, the fingers divide the junction of the parietal and diaphragmatic pleura If the distance from the xiphoid to the point of origin of the diaphragm on the costal arch is too small, the attachments of the diaphragm can be separated to any distance necessary to admit the hand for cardiac massage The patient died in whom this method was used, but the authors feel that familiarity with it should eliminate delay by the average surgeon Access to the heart is gained through a natural anatomic plane of cleavage, which eliminates the need to incise the diaphragm or the chest wall Closure is accomplished without additional suturing

Subdural Hematoma, Hygroma, and Hydroma in Infants.—This paper deals with 22 children less than one year old who had symptoms of subdural hematoma In all but one of the children the symptoms began during the first four months of life, and in 10 of these during the first week In 16 the history showed prematurity, prolonged labor, abnormal presentation, difficult forceps delivery, or cesarean section Other types of trauma were known in three instances Two patients had infections that may have been causally related to the onset of the hematomas The commonest symptom was some type of gastrointestinal upset. The diagnosis of subdural hematoma was made by subdural and spinal punctures in 12 of the 22 cases All showed bloody and/or xanthochromic subdural fluid in the presence of spinal fluid with a normal protein content The demonstration of a dilated subdural space by oxygen injection led to the diagnosis in six patients, one of whom had clear subdural and spinal fluids All of the remaining patients had bloody and/or xanthochromic subdural fluid with clear spinal fluid The diagnostic subdural puncture relieves the acute pressure on the brain, and thus it must be the aim of the surgical treatment to prevent the late effects of chronic pressure by either a constricting membrane or a persistent collection of subdural fluid Thirty operations were performed in 17 patients, 25 osteoplastic flaps were made, and five trephinations were performed The terms used to describe the conditions found at operation were chronic subdural hematoma, to indicate bloody and/or xanthochromic fluid encapsulated by a well-defined neomembrane, hygroma, to indicate a collection of xanthochromic fluid free in the subdural space with a nonencapsulating neomembrane, hydroma, to indicate a collection of colorless or slightly xanthochromic fluid free in the subdural space with no evidence of a neomembrane The merit of these distinctions is that they carry with them specific implications for treatment. The authors concluded that they all may represent stages in healing of subdural or intradural hemorrhage and that birth trauma is the commonest precipitating factor

Prenatal Multiple Immunization—A group of women attending a prenatal clinic were given a Schick test on admission Immunization procedures were carried out on these women in the last trimester of pregnancy Schick positive mothers were immunized against both diphtheria and whooping cough, Schick-negative mothers against whooping cough alone Certain patients of both groups were inoculated with a single injection of influenza virus vaccine The injections were so spaced that immunization was completed approximately six weeks before delivery The immunizing series for pertussis and diphtheria consisted of three injections given at intervals of four weeks For influenza immunization, one injection was given six weeks before the expected date of delivery Blood for titration of antibodies was taken from the mother before the immunizing series was begun and again at delivery Cord blood, representing the fetal circulation, was also taken at delivery It was found that 80% or more of the women responded with high titers of antibodies These protective titers were quantitatively passively transferred to the newborn babies, in whom they persisted for three months or more There were no adverse effects on either mothers or babies from inoculations given in the last trimester of pregnancy The method of prenatal multiple immunization would seem to protect the newborn baby against diphtheria and pertussis, and if need be, influenza and tetanus during the first three months of life when effective active immunity cannot be established Active immunization should follow at 3 to 4 months of age, when passive immunity has been lost and when mechanisms for establishment of active immunity function more efficiently than at an earlier age

Veratrum Viride and Hexamethonium in Hypertension—In most of the patients with hypertension discussed here the diastolic pressure was persistently above 120 mm of mercury, even during bed rest The patients who did not respond to conservative treatment, such as rest, reassurance, and sedation, were given purified extract of veratrum viride in tablet form or a low sodium diet or both In rare cases veratrum alone kept the patient's blood pressure in the benign range, in a greater percentage diet plus veratrum was required, and in still others sympathectomy and diet plus various types of drug treatment had to be used together Veratrum derivatives are difficult to regulate over long periods, for the following reasons 1 Varying dosage requirements in different patients necessitate individual adjustment. 2 During therapy with veratrum there is considerable fluctuation in blood pressure from day to day, although the average may be lower In some of the most severe cases it was necessary for a member of the family to check the blood pressure before each dose of the drug 3 The margin between the dose that lowers blood pressure and that which produces side-effects is narrow During the past six months the effects of the new ganglionic blocking agent, hexamethonium, or C6, have been investigated in patients with hypertension at the author s clinic This agent produced sustained reductions of arterial pressure in almost all hypertensive patients A remission of the malignant phase of hypertension occurred in 11 of 15 patients The four who did not respond had advanced renal failure with uremia Tolerance developed rapidly when the doses were repeated at intervals of four or six hours, but, when separated by 12-hour intervals, the development of tolerance was largely prevented If under these circumstances the drug becomes ineffective, the hypotensive action can be restored by increasing the dosage The average initial dose was 10 mg, but after several weeks of continuous therapy the average effective dose was 35 mg The commonest side-effects of hexamethonium were dry mouth and constipation, the most serious reactions were paralytic ileus and inability to urinate All of these side-effects can be overcome by the concurrent administration of the urethane of bethanecol chloride (urecholine®) in doses of 10 mg under the tongue three times a day

Combinations of Antibiotics.—This report concerns the synergistic and antagonistic effects of combinations of penicillin, dihydrostreptomycin, aureomycin, chloramphenicol, and terramycin Laboratory reports supporting the clinical use of combinations of the various antibiotics are confusing and in some cases contradictory Furthermore, in many instances the clinical significance of the laboratory data is yet to be established However, a few facts of significance seem clear First, a synergism between penicillin and dihydrostreptomycin has been established Second, there appears to be an antagonistic effect between penicillin and aureomycin or chloramphenicol Third, certain bacteria made resistant to aureomycin, to terramycin, and to chloramphenicol do not show an increased resistance to dihydrostreptomycin Bacteria made resistant to dihydrostreptomycin do not show an increased resistance to the other three antibiotics These findings indicate that combinations of aureomycin and dihydrostreptomycin are effective in the treatment of brucellosis, and that combination of aureomycin or terramycin with dihydro streptomycin would be effective in the treatment of peritonitis meningitis, and bacteremia, when the organism causing these infections is unknown The recommended treatment in subacute bacterial endocarditis due to enterococci consists of a combination of penicillin and dihydrostreptomycin This combination is also advisable when the etiological agent is unknown

Cortisone in Glomerulonephritis.—Four patients in the various phases of glomerulonephritis and two patients with the nephropathy of disseminated lupus erythematosus were studied during cortisone administration The drug was given in doses of 100 150, or 200 mg daily for periods up to 30 days Transient improvement in renal function, as measured by the renal plasma flow and glomerular filtration rate, occurred during the administration of cortisone, but hematuria and albuminuria did not decrease, and, in some instances, increased Cortisone had no demonstrable beneficial effect on the basic pathological process in the glomerular capillaries In both patients with lupus erythematosus, severe hypertension was produced

Intravenously Administered ACTH —Renold and associates report on about 100 subjects who received corticotrophin (ACTH) intravenously The substance was dissolved in 500 ml of saline solution or a 5% solution of dextrose in water and was infused intravenously over a period of eight hours When 20 mg of corticotrophin is given in this manner maximum adrenal cortical stimulation results in the average person In addition to representing a substantial saving in material and cost of therapy, the intravenous route activates the adrenal gland in patients unresponsive to intramuscularly administered corticotrophin and is capable of reactivating the adrenal cortex suppressed by cortisone therapy No anaphylactic reactions have been noted, however, until a much larger group has been studied, patients should be watched for the first 30 min of the infusion The longest follow up period is five months at the time of writing and as many as 32 infusions have been given to the same patient over a period of 16 weeks without evidence of sensitivity reactions Of 12 representative cases, six who had rheumatoid arthritis were given corticotrophin intravenously for 12 to 19 consecutive days, and satisfactory remissions were obtained Whether the permanent results differ from those obtained with large doses of intramuscularly administered corticotrophin remains to be seen Exfoliative psoriasis resistant to intramuscular corticotrophin, acute exfoliative dermatitis following the use of penicillin ointment, acute gout, generalized Boeck's sarcoid, ulcerative colitis combined with rheumatoid arthritis, and nephrotic edema are other conditions that responded to the intravenous administration of corticotrophin The authors conclude that the clinical results obtained with intravenously administered corticotrophin (20 mg daily) compare favorably with those obtained with doses of five to 10 times this amount given intramuscularly

Treatment of Eosinophilic Pneumopathy —Vines and Clark present the case of a woman, 41, who had been relatively healthy, except for being subject to hay fever since the age of 15 Her present disorder, which had begun as a cough and cold, was tentatively diagnosed as bronchopneumonia and then as virus pneumonia Treatment with penicillin aureomycin, and then with streptomycin and penicillin failed to produce the desired therapeutic effect Examination of the blood revealed significant eosinophilia and repeated chest x ray films disclosed increasing pulmonary infiltration Low grade fever and a rapid pulse rate continued, but repeated sputum studies were negative for acid fast bacilli The sputum was loaded with eosinophils When resumption of treatment with antibiotics proved ineffective diagnoses of a Loeffler type of syndrome or of periarteritis nodosa were entertained Respiration became more labored, and the patient had to be placed into an oxygen tent Before treatment with corticotrophin (in 25 mg doses every six hours) was started, the eosinophil count was 9,100 per cubic millimeter Within 24 hours there was much improvement, and the temperature dropped to normal The blood sedimentation rate began to decline After two days of therapy the absolute eosinophil count was 25 per cubic millimeter The chest roentgenograms also revealed a remarkable response The corticotrophin appeared to be life saving for this patient She has now been active for over a year, although mild allergic symptoms and low-grade eosinophilia persist This woman was more acutely ill than the average patient with a Loeffler syndrome, also known as eosinophilic pneumopathy or the E-P syndrome

Tetany During Diuretic Phase of Lower Nephron Nephrosis.—The case presented illustrates problems associated with the diuretic phase of lower nephron nephrosis The case is noteworthy because it is the first in which tetanus developed during the diuretic phase The appearance of tetany after an intravenous infusion that contained enough potassium to raise the serum potassium level from 3 1 to 5 2 mEq per liter suggests that an alteration in the calcium potassium ratio may have played a part Either ionized calcium depression or potassium elevation may cause increased neuromuscular activity The tetany probably developed in the following manner Hypocalcemia and hyperphosphatemia occurred during renal shutdown because of failure of the kidney to excrete phosphorus (and phosphorus rise from tissue breakdown), with greater loss of calcium into the gut and urine, chronic acidosis led to the ionization of a great part of the available serum calcium, pulmonary edema with hyperventilation resulted in a shift in serum pH toward the alkaline side, with decreased concentration of ionized calcium, and potassium administration altered the calcium potassium ratio, producing increased neuromuscular activity The authors stress that the complications of the diuretic phase of lower nephron nephrosis may be as dangerous as the preceding period of anuria Uremia may persist far into the recovery phase Massive diuresis may result in water and electrolyte depletion Attempts to prevent dehydration by intravenous replacement of the total volume of fluid lost may result in pulmonary edema When diuresis reaches the extent of 4 L in 24 hours, it may be dangerous to administer 5 L of fluids In the presence of low serum calcium and potassium, administration of potassium may result in tetany, unless calcium is administered simultaneously

Premature Infant Mortality N J Robinson and C. H Hall —p 235

Methemoglobinemia in Infants and Nitrates in Well Water.—Two cases of methemoglobinemia in infants are presented in which well water with a high nitrate content had been used for the preparation of the formula The first case is of interest in that the baby had been given the formula in which well water was used as the diluent for only three days before development of the cyanosis. The relatively rapid development of the cyanosis was apparently due to the high concentration (728 ppm) of nitrate in the water The high bacterial content and the shallowness of the well may have been additional factors When a physician observes cyanosis in an infant, especially in one under 6 months of age, who is fed with well water and who has no other physical abnormality, he should consider the diagnosis of methemoglobinemia due to the ingestion of well water with a high nitrate content. Extensive laboratory studies are not necessary A spectroscopic determination of methemoglobin will provide a definite diagnosis Well water that is to be used in the preparation of a formula for an infant should be tested for the presence of nitrates

Radiation Injury from Atomic Bombs.—It is widely believed that panic caused by an overwhelming fear will be the greatest hazard in the event of an atomic explosion Education and indoctrination of the public should allay this greatest of hazards in atomic warfare Radiation injury resulting from atomic weapons is of two types (1) the superficial ionizing radiation burn from soft radiation (beta), (2) total body radiation injury, "the syndrome of acute radiation injury," from penetrating whole-body radiation (gamma and neutrons) The exposed population may number in the hundreds of thousands, and a classification based on likelihood of survival may be desirable Distance from the explosion radiation dosimeters, and symptomatology may aid in the segregation into groups to facilitate prognosis and treatment With regard to prognosis the following points are stressed 1 If vomiting occurs on the day of the bombing and is followed by diarrhea, prostration continued vomiting, anorexia, and fever, survival is improbable, and death will occur in a matter of days 2 If vomiting occurs on the day of the bombing and is followed by an asymptomatic period of one to three weeks before appearance of the typical symptoms of radiation injury (purpura, epilation, ulcerations of the mucous membranes, and gastrointestinal disturbances), survival is possible 3 If there is no vomiting on the day of the bombing, survival is probable unless there are complicating factors such as burns, thermal injuries, traumatic injuries, or concomitant epidemics Epidemics in a leukopenic population may be catastrophic The treatment of the pancytopenia temporarily induced by potentially lethal amounts of radiation is essentially no different from idiopathic pancytopenia or that temporarily induced by drugs or infection There is no new drug hormone, or vitamin that when administered after irradiation will increase the survival rate, however it may be possible to increase the survival rate by accelerating recovery of hematopoiesis

Coronary Thrombosis in Chronic Peptic Ulcer.—The autopsy records of a large series of consecutive chronic ulcer patients and of patients with other disorders were investigated for coronary thrombosis and myocardial infarction Of 116 patients who died of chronic peptic ulcer, 27 (23%) had evidence of coronary thrombosis. The comparative figure for patients dying from acute diseases was 8%, from thyrotoxicosis 4% from malignant neoplasms 6%, from "alcoholic' cirrhosis of the liver 5% and from diabetes mellitus 24% The incidence of coronary atherosclerosis and of coronary thrombosis with myocardial infarction is high, almost the same as in diabetes mellitus Although the exact mechanism of the development of atherosclerosis in patients with peptic ulcer cannot be definitely defined the author suggests that chronic or continual stimulation of the gastric vagus nerve alone may mediate these changes in the coronary arteries Prolonged, excessive ingestion of large quantities of milk, cream, butter, and eggs such as required in the Sippy diet, may also cause coronary atherosclerosis leading to ultimate coronary thrombosis with myocardial infarction These two etiologic agents in chronic peptic ulcer may act synergistically in the production of coronary atherosclerosis

Endometriosis in Rhesus Monkey —An adult female rhesus monkey (Macaca mulatta) had dysmenorrhea, and post-mortem microscopic study disclosed extensive spontaneous endometriosis The monkey had been under observation for approximately nine years and four months for behavior changes following bilateral removal of the prefrontal and temporal lobes Her abdomen had never been opened until autopsy was performed Four years after the last cerebral operation she had symptoms of severe dysmenorrhea and died two years thereafter on the seventh day of a menstrual period The abdominal cavity was distended with blood and menstrual debris and showed extensive adhesions The peritoneal surface of the uterus, adnexa, bladder, and pelvic wall was covered with a tissue that had all the characteristics of endometrium It was in the process of menstruation, in some areas there had been little or no loss of tissue, elsewhere only a film of stroma remained Various conditions developing after the second temporal lobectomy may be ascribed to an endocrine imbalance related to degeneration of fibers and injuries to the hypothalamus, e g, hypersexuality, polydipsia, bulimia with progressive adiposity, and hyperplasia of the rete ovarii It is suggested that the endometriosis also resulted from the endocrine dyscrasia. Except for the apparent implantations on the intestines, this case of endometriosis can best be explained as due to a metaplasia of the pelvic peritoneum

Aureomycin in Peritonitis —This report covers 235 cases of peritonitis in which aureomycin was used There were 22 deaths, an over all mortality rate of 9 36% The mortality rate for all types of peritonitis in this series is compared with those found in the same hospital (Harlem) during the two years preceding this study, in which penicillin, streptomycin, and sulfadiazine were used Adjuvant procedures of gastrointestinal decompression, maintenance of circulating fluid volume, and infusions and transfusions were practiced in both series of patients. A comparison of the two groups reveals a significant reduction in mortality since aureomycin has been used Only seven (3 18%) of the deaths can be attributed to failure of the antibiotic therapy, and the rest were due to the surgical procedure or the patient's general condition The mortality rates have been reduced by more than 50% in several of the categories reported as compared with the two previous years Only in intestinal obstruction without resection was there an increase in mortality rate The mixed bacteriologic flora of peritonitis contains organisms that are usually quite sensitive to aureomycin Aureomycin is administered intravenously in 500 mg. doses twice daily The dosage in children is proportionately less Oral administration of a similar dose is begun as soon as gastrointestinal decompression can be discontinued This dosage schedule has been checked by the aureomycin content of blood and peritoneal fluid, by in vitro sensitivity tests of various micro-organisms to aureomycin, and by the clinical results Side reactions were minimal, and no organic toxicity was demonstrable The phlebitis sometimes resulting from intravenously administered aureomycin hydrochloride has been eliminated by the use of the glycinated form Aureomycin is considered the antibiotic of choice in the therapy of peritonitis

**Management of Newborn Infant with Symptoms Indicative of Myasthenia* Gravis J G Holt and A E Hansen.—p 299

Hyperthyroidism Produced by Thyroid Extract.—The case presented was that of a woman, 34, who, until six months prior to examination, had been taking 25 grains (1 62 gm) of thyroid extract daily under a physician s supervision to lose weight She had been taking thyroid one and one half years, but only for the final 10 months did she take 25 grains daily At the end of this time the patient discontinued the medication because she had become extremely nervous and was unable to sleep Shortly afterward she noted uncontrollable tremor of the hands and short episodes of tachycardia Exophthalmos began to develop, and the tremor tachycardia, and nervousness became more conspicuous Thus, the classic picture of hyperthyroidism continued to develop during the six months after discontinuance of the medication The basal metabolic rate was + 34% The patient was treated with strong iodine (Lugol s) solution, propylthiouracil, and a mild sedative Eight weeks after the start of treatment a bilateral subtotal thyroidectomy was performed Two months after the operation the woman was almost free from symptoms

Myasthenia Gravis in Newborn Infant —Symptoms indicative of myasthenia gravis observed in a newborn infant responded to the administration of neostigmine In all of the four previously reported cases of this type, the infants were born to mothers with myasthenia gravis Two of these infants died, and two survived Infants born to mothers with myasthenia gravis should be observed during the neonatal period for symptoms of the disease If such symptoms appear, immediate intramuscular administration of neostigmine is recommended as a therapeutic test and, provided a satisfactory response is obtained, treatment with the drug should be continued for at least three weeks

Renal Changes During Ileus H Eufinger —p 103

Treatment of Idiopathic Megacolon in Children.—The form of megacolon appearing in adults is usually of the symptomatic type This form increased during the postwar period of starvation It usually yields to conservative measures The idiopathic form, appearing in children, which is usually called Hirschsprung's disease, presents a more difficult therapeutic problem In this form conservative methods usually fail Interventions on the abdominal sympathetic, which a decade or two ago represented the chief surgical methods, have failed and are now generally rejected Today operations on the colon itself are again the preferred methods of surgical treatment Before the neurosurgical era the resection of the dilated portions of the colon usually took the form of a left-sided hemicolectomy Observations on the seven children discussed by this author corroborated the good late results obtainable with this method However, since it does not appear to remove the cause there is a possibility of further progression of the dilatation of the colon in the proximal portions If this happens, then total colectomy must be done More recent investigations into the cause of typical Hirschsprung s disease, in which the lower sigmoid portion is contracted, have induced some to resect this contracted portion of the colon, with preservation of the anal sphincter However, it still has not been completely proved that this difficult method removes the cause In the idiopathic form, with dilated rectum, resection of the sigmoid portion or the left sided hemicolectomy remains the method of choice for the present

Pathology, Diagnosis and Treatment of Subdural Empyema. M P De Grood —p 128
*Peptic Ulcer of Gallbladder J K. W Kehrer and A De Minjer —p 151

Treatment for Coarctation When Resection Is Impossible.—Surgical treatment was tried by Boerema in 15 patients with stenosis of the aortic isthmus End to-end anastomosis of the aorta succeeded in nine patients and end to-side anastomoses of the arcus aortae to the aorta descendens succeeded in four cases One patient died, in this case the aorta was so degenerated that the sutures could not hold the diseased tissue The case of another patient is presented in greater detail, because resection was impossible with any of the accepted methods After the isthmus had been exposed it was found that past the origin of the subclavian artery the aorta was very wide over a distance of about 5 cm Beyond this the narrowed part was several centimeters long, and the aorta descendens distal to the stenosis was as thick as a pencil as far as the diaphragm. The afferent intercostal vessels were not dilated It was impossible to effect a better inflow of blood in the aorta descendens, but it seemed essential to strengthen the dilated, balloon like part of the aorta between the origin of the subclavian artery and the isthmus since it pulsated so much more than the arcus aortae that a future rupture seemed possible The author decided to fortify the aortic wall in this region by placing around it a jacket of tissue, which might give rise to the formation of a substantial layer of connective tissue A piece of skin from the thoracic wall from which all fat had been removed was placed around the arcus aortae and the pulsating bulbus The patient recovered The usefulness of this plastic method is difficult to prove, but it may be expected that the apparently ominous and fatal rupture has been postponed for a long time.

Peptic Ulcer of Gallbladder.—The case here reported is noteworthy not only because disorders of the gallbladder are rare in children, but also because the cause was exceptional The patient was a girl, 9, who was hospitalized with severe abdominal pain and vomiting A rather large tumor was felt below the edge of the liver but could not be identified at first. After numerous examinations had failed to clarify the case, laparotomy was done, and evidence of inflammation of the gallbladder was found After this organ was removed, the patient made an uneventful recovery A viscid, black-brown fluid containing some blood clots was found when the gallbladder was opened No stones were found, but it was clear that there had been a hemorrhage into the gallbladder, which explained the enormous distention found at the start of the operation After the bloody contents were washed out, a small black point could be seen close to the beginning of the cystic duct, at the side opposite the attachment to the liver, surrounded by a moderately thickened edge, thus imitating closely the shape of a peptic ulcer in the stomach Further examination disclosed that the ulcer lay at the mouth of a small diverticulum The mucosa of the diverticulum consisted of typical acid producing gastric mucosa.

Radioactive Phosphorus in Breast Tumors.—Tracer doses of about 150 μc of radioactive phosphorus (P^{32}) were given intravenously to five patients with malignant breast tumors attached to the skin, and measurements were made with a beta counter applied directly to the skin, before, during, and after x ray treatment, and, in one case, during a course of diethylstilbestrol treatment The count rate recorded was much higher over the tumor (three to eight times), and to a lesser extent over the whole of that breast, than over corresponding sites on the normal breast The exponential rate of disappearance of radioactive phosphorus was found to be approximately the same for both breasts, but after the second or third x ray treatment a sudden fall was observed in the count rate over the tumor and over that breast relative to that over the normal breast This result was obtained in all cases, including one in which both breasts received the same low voltage (140 Kv) irradiation. No such change occurred during diethylstilbestrol treatment in a patient who did not respond clinically After erythema had subsided the ratios of measurements over the two breasts were found to be similar to those before treatment

Cortisone in Diseases of the Eye —Cortisone acetate ointment (25 mg per gm) and a 2 5% suspension of cortisone in isotonic sodium chloride solution (25 mg per ml) were used in the treatment of various diseases of the eye in 143 patients It was concluded that the method of choice is, first, subconjunctival injection, followed by the instillation of cortisone drops every two hours during the day and the application of cortisone ointment to the conjunctival sac at night, the subconjunctival injection of cortisone being given every second day The number of subconjunctival injections required varies from case to case, and local treatment should be continued until the inflammatory condition has subsided or until it is apparent that no response is being obtained If a relapse occurs the treatment should again be instituted Results showed that 30% of the patients were much improved, 27% were moderately improved, and 43% were therapeutic failures Interstitial keratitis was particularly benefited, and iridocyclitis also improved rapidly in most cases Treatment of two patients with sympathetic ophthalmia with systemic cortisone was successful Cortisone is very valuable in the control of allergic reactions in the eye but has no effect on any underlying disease that may be the basic condition The good effects of locally applied cortisone are confined to conditions involving the anterior segment of the eye In those of the posterior segment amenable to cortisone treatment, its parenteral use is indicated The local use of cortisone produced disappointing results in scleritis For this condition it seems necessary to give cortisone parenterally

Diabetes and Pregnancy —A series of 25 consecutive diabetic pregnancies beyond the 28th week is reported No mother died, and 23 babies are living The remaining two were stillborn In 12 of the mothers diabetes mellitus developed between 21 and 30 eight patients were under 21 and five were over 30 One patient was observed to have diabetes mellitus a few days before delivery, the remainder, with two exceptions, had attended the diabetic clinic regularly Eight were nulliparous 10 had had one child and seven had had two or more children Two patients were stabilized on diet alone three required less than 20 units of insulin, and 14 required more than 60 units each day Twenty-one patients had their diets increased, 17 their insulin increased, three their insulin reduced, and the remainder required no change Hormone treatment was not used, because biological assay could not easily be done and because uncontrolled use of estrogens was thought undesirable In eight patients hypertension developed, in eight edema, in one albuminuria, and in one postpartum eclampsia Six patients had hydramnios, an incidence of 23%, which was higher than usual Delivery was spontaneous in four, medical or surgical induction was practiced in 12 and cesarean section was performed in nine For both primigravida and multigravida, cesarean section is being more readily employed The good neonatal results obtained confirmed the authors' belief that termination in the uncomplicated case should be undertaken just before the 36th week of pregnancy and that delivery should be completed by the end of the 36th week If the close cooperation of the obstetrician and the physician can reduce stillbirths and intrauterine deaths, allowing the well-controlled diabetic mother to be delivered of a living baby, then the infant should stand a good chance of survival even when it is born at the 36th week After birth the skill of the nursing staff in providing careful neonatal control without overtreatment of the baby is the most important factor in reducing neonatal deaths

Radioactive Phosphorus in Polycythemia Vera.—In his evaluation of treatments used in polycythemia vera, Odenthal gives particular attention to radioactive phosphorus, P^{32}, first used by investigators in the United States in 1940 He himself used this substance during the past two years in 19 patients with polycythemia vera He injected the substance intravenously in the form of an isotonic solution of sodium phosphate Radioactive phosphorus has a half life of 14 days A portion of it (in some cases up to 30%) is rapidly excreted in the urine Thus the biologic half value time is less than the physical half value time Radioactive phosphorus, just as ordinary phosphorus, is deposited in organs that have a high rate of phosphorus metabolism, in patients with polycythemia chiefly in the bone marrow So that natural phosphorus would not replace the isotopic phosphorus too rapidly, the phosphorus content of the diet was kept low for a time Radioactive phosphorus represents a causal therapy for polycythemia vera in that the blood forming organs in the bone marrow are being irradiated and the hematopoiesis is thereby inhibited Radioactive phosphorus has no hemolytic effect on the circulating erythrocytes Thus, the therapeutic effect becomes evident in the decrease in erythrocytes only after from six to 10 weeks, when the circulating erythrocytes have completed their life span A noticeable decrease in reticulocytes, however, is evident earlier The leukocyte and thrombocyte counts also decreased, but with cautious dosage irreversible changes were not observed in organs other than the erythropoietic ones The initial dose of radioactive phosphorus was usually 3 to 5 mc Since the action of this dose persists for about three months, additional doses are not given before this period has elapsed In a few rare cases a single injection was sufficient, but usually two or three injections were given The total dose in individual cases varied between 3 5 and 18 mc Good results were obtained in the 19 patients treated with this method who have been followed for up to two years The histories of four of these patients are presented

Relation of Peptic Ulcer to Other Disorders —An analysis of 1,992 consecutivce post mortem examinations between 1931 and 1933 showed an over-all incidence of peptic ulcer of 18 23% In 1,228 male patients the incidence was 21 8% and in 764 female patients the incidence was 7 9% Gastric ulceration was slightly commoner in women than in men (1 0 0 88), while duodenal ulceration was commoner in men (2 75 1 0) In men duodenal lesions were between three and four times commoner than gastric lesions, while the lesions were of equal incidence in women An investigation into the relationship of ulcer lesions and other pathological conditions indicated a possible tendency to peptic ulceration in young patients with coronary sclerosis and in young male patients with pneumonia and other acute infections Female patients between 45 and 54 with gallbladder disease also showed a tendency to peptic ulcer

Hirschsprung's Disease —Clinical, radiological and pathological studies on megacolon and, in particular, of Hirschsprung s disease have produced a new etiological concept which localizes the primary pathological process in the undilated segment of bowel distal to the hypertrophied and dilated part An agenesis of ganglion cells in the intramural plexuses of that segment results in absence of normal peristalsis Removal of that part of bowel by rectosigmoidectomy is claimed to be the rational treatment of Hirschsprung's disease and has given remarkable results

*Use of Hyaluronidase to Facilitate Cutting of Free Skin Grafts Under Local Anaesthesia J A Cameron —p 150

Hyaluronidase to Facilitate Cutting of Free Skin Grafts —Experience with hyaluronidase in the administration of fluids subcutaneously suggested its use in the cutting of skin grafts with the patient under local anesthesia In the past the use of local anesthesia for this purpose presented technical difficulties Owing to lack of spread ” multiple skin punctures were required and the resulting skin surface was irregular or undulant, thus adding to the difficulty of cutting the grafts and resulted in undesirable variation in thickness of skin and, not infrequently, multiple perforations Then there was the risk of 'islands " where anesthesia was either absent or incomplete As a result surgeons were reluctant to use local anesthesia except for small areas of skin This was unfortunate in that many patients with burns are debilitated and not good subjects for general anesthesia At the Royal Infirmary in Glasgow hyaluronidase has been used in 32 patients who required skin grafting for burns Some of them were selected because they were unfit for general anesthesia Hyaluronidase was added in the proportion of 1 mg to 4 oz (125 cc) of 1% procaine solution The addition of 1 in 1,000 epinephrine (5 minims to the ounce) helped to delay absorption of the anesthetic and, by causing blanching of the skin, demarcated the anesthetic area In nervous patients preoperative basal narcosis was administered subcutaneously The donor area was the thigh After preparation of the skin, the donor area was outlined with dye and the initial puncture was made at the upper end of the area and the solution injected fan wise from here There is visible spreading of the solution Further injections are made into the already anesthetized skin, until the whole donor area has been infiltrated The anesthetic solution spreads quickly and evenly and leaves a smooth, flat surface from which a graft can be cut with no more difficulty than when a general anesthetic is used The injection of the anesthetic solution is less uncomfortable and painful than usual In these cases, healing of the donor areas occurred normally

*Effects of Bilateral Splanchnicectomy (Adrenal Enervation) on Progressive Chronic Inflammatory Rheumatism J Graber Duvernay J J Herbert F Gerbay and others.—p 537

Splanchnicectomy for Rheumatoid Arthritis. — Splanchnicectomy with section of the great splanchnic nerve where it branches off into the suprarenal ganglion and into the celiac ganglion was performed on five patients between the ages of 26 and 57 with rheumatoid arthritis (chronic progressive polyarthritis) Bilateral splanchnicectomy in two stages, with an interval of 15 to 25 days between the interventions, was performed on three patients, and unilateral splanchnicectomy on the two others In general, the operation was well tolerated except for severe fronto-occipital headache for three to four days after the intervention in one patient Temporary lumbo sacral hypesthesia of several weeks' duration was noted in all patients Within eight hours of the intervention the pain in the joints disappeared or, in joints with old destructive lesions, became less severe The inflammatory changes responded more slowly but they too regressed within four days It became possible to discontinue the administration of acetylsalicylic acid (aspirin), and walking could be resumed within 10 to 12 days after the intervention The duration of this clinical improvement varied considerably, depending on the importance of the joint lesions The sedative effect of the intervention did not last longer than 30 to 40 days in the presence of bone lesions, but its duration was prolonged in patients with only inflammatory changes The follow-up period of four to five months was too short for evaluation of the full effect of the intervention Biologic tests showed a diminution of the lymphocytes and eosinophils, an increase in polynuclears, and hyperglycemia associated, in four patients, with temporary glycosuria A therapeutic trial with corticotrophin failed in two patients, who again had severe joint pain 2 months after the splanchnicectomy On the contrary cortisone proved extremely effective when it was substituted for corticotrophin Pain subsided within a few hours, and at the same time the sedimentation rate was reduced Doses of 75 mg and then 50 mg of cortisone were given daily, with a total dose of 1 25 gm Pains reappeared after one month but again could be controlled with daily doses of 25 mg of cortisone Splanchnicectomy, by severing an adrenohypophysial interrelaship, entails temporary hyperfunction of the adrenal cortex and reduces the pituitary tutelage It thus increases the substitutive effect of cortisone, which in small doses is highly effective in patients who have undergone splanchnicectomy, to whom cortisone may be given without risk for indefinite periods, provided that improvement is persistent

Convulsions in Purulent Meningitis.—This report concerns 90 consecutive patients with purulent meningitis admitted to the children s departments of the United Oxford Hospitals between November, 1946, and March, 1950, who received the chemo therapy appropriate for the infecting organism Children who did not receive the appropriate chemotherapy and children with tuberculous and nonbacterial meningitis were excluded The causal organisms were meningococcus (56 cases), Haemophilus influenzae (17 cases), pneumococcus (11 cases) beta hemolytic streptococcus (two cases), and Staphylococcus aureus, Staph albus, Escherichia coli, and Bact paracoli (one case each) It was found that purulent meningitis in young children carries a 20% mortality rate in spite of adequate chemotherapy A close association exists between failure of treatment and the occurrence and intensity of convulsive seizures Multiple seizures carry a grave prognosis Possibly both the failure of treatment and the seizures spring from the common root of irreversible cerebral damage There is, however, evidence that the seizures are themselves harmful In the patients who received prophylactic phenobarbital the reduction in failure rate ran parallel with the reduction of the seizure rate, this suggests that the anticonvulsant may well have lowered the failure rate by raising these children's resistance to seizures Further, convulsions may progress to status epilepticus, and this syndrome if uncontrolled, is fatal Routine prophylaxis with phenobarbital is safe and may lead to a reduction in the mortality rate Rapid and intensive treatment of established convulsions is indicated The drug of choice is not yet established, but the results of trials with intramuscularly administered amobarbital sodium are promising When convulsions are prevented or do not occur recovery follows in 96% of the cases

Posterior Arachnoiditis Caused by Nematodes T P J Botman —p 141

Penicillin in Suppurative Pericarditis —A rare example of acute suppurating pericarditis in a child is reported A boy, 2, had high fever that did not subside following treatment with sulfonamide preparations The symptoms, electrocardiographic record and chest roentgenogram led to a diagnosis of exudative pericarditis Puncture in the fifth intercostal space yielded 70 cc of seropurulent fluid, which indicated acute suppurating pericarditis The cause seemed obscure at first, since the child had not had pneumonia with empyema, nor typhoid, nor osteomyelitis, but impetigo had been present for a rather long time The pericardial puncture was followed by the injection of 25,000 units of penicillin into the pericardial sac Intramuscular injections of 25,000 units of penicillin were given every three hours Culture of the purulent pericardial fluid yielded a nonhemolytic Staphylococcus, which proved sensitive to penicillin Daily pericardial punctures revealed that at first the suppuration continued to increase Quantities of 50 to 300 cc of pus were evacuated at each puncture, which was always followed by the instillation of 50 000 units of penicillin into the pericardium The general condition improved slowly, and the fluid finally disappeared However, after many weeks generalized edema and oliguria suddenly developed Both were counteracted by a mercurial diuretic Complete recovery followed A year later the child felt well and no signs of constrictive pericarditis were present Thus the purulent pericarditis had yielded to conservative therapy

Tubercle Bacilli in Sputum in Pulmonary Tuberculosis —Frequent sputum cultures were made on 106 patients with primary and postprimary forms of pulmonary tuberculosis It was found that in 82% of the patients in whom active pulmonary lesions persisted, excretion of tubercle bacilli persisted for one to 20 months Nine patients in whom the pulmonary process had become clinically inactive still showed intermittent excretion of tubercle bacilli Sixteen patients (15% of the total number) showed no further excretion of tubercle bacilli up to at least five months before the end of the sanatorium treatment (10 successive sputum-cultures or cultures of the gastric lavage were negative) Owing to the fact, however, that prolonged intermissions in the excretion of tubercle bacilli had previously occurred it is doubtful if the pulmonary process may be considered as really closed' in these cases In 79 cases (that is 74 5% of the total) the sputum became apparently permanently negative after a more or less regular discharge of tubercle bacilli had existed for a variable period

Prophylactic Inoculations and Poliomyelitis —There were 675 cases of poliomyelitis reported in Victoria from January to November 1949 of these, 620 were investigated with regard to a possible relation of prophylactic inoculations to the onset of poliomyelitis In 53 patients who had received an injection of diphtheria toxoid or pertussis vaccine, alone or in combination within three months of the onset of symptoms exact information on the date and site of injection could be obtained The severity of paralysis in the last inoculated extremities of children who had received pertussis vaccine alone or in combination was greater than in those of children who had received diphtheria toxoid alone and also greater than in the corresponding extremities of noninoculated children Thus there is evidence that recent inoculations of pertussis vaccine alone or in combination with diphtheria toxoid are more likely to be followed by paralysis than recent inoculations of diphtheria toxoid alone and that the paralysis following inoculations with pertussis vaccine alone or in combination is more severe than that following inoculations with diphtheria toxoid alone

*Sclerosis of Adrenal Medulla Treatment of Human Arterial Hypertension M Riser Lavitry Gleize and Rascol—p 869
Acute Porphyria Treated by Exchange Transfusion M Deparis J Canivet J Dausset and P Rossignol—p 870
Symptomatic Triad Linked to Cardiovascular System in Hypoglycemic Shock B Yagdjoglou—p 872

Sclerosis of Adrenal Medulla and Arterial Hypertension—Using the technique of Mandache and co-workers, Riser and associates produced sclerosis of the adrenal medulla in 10 adult dogs by injecting 1 to 2 cc of 30% salicylic acid in 20% hypertonic solution of polyvinyl pyrrolidone (subtosan) into the adrenal medulla at three different points Neither acute nor subacute adrenal insufficiency was observed On an average, 75% of the medullas of the 20 adrenal glands studied were destroyed while the cortices remained almost unimpaired without any drop in arterial tension or blood sugar, or any disturbance of water and sodium chloride metabolism In seven patients with arterial hypertension who first were subjected to Smithwick s thoracolumbar sympathectomy, sclerosis of the adrenal medulla was produced by ligature of the large suprarenal vein followed by an injection of 4 to 5 cc of the salicylic acid polyvinyl pyrrolidone solution into the medulla at three different points at a distance of 1 to 2 cm The diastolic arterial pressure of 130 to 150 mm of mercury in these patients had been reduced by 10 to 15 mm as the result of 10 days of bed rest and salt free diet before the intervention This "tension at rest" was considerably reduced by the Smithwick operation combined with artificial sclerosis of the adrenal medulla In some of the patients drop in systolic and diastolic pressure by several centimeters occurred rapidly within two to three days suggesting a temporary inhibition of the adrenal cortex and requiring injections of extract of total adrenal cortex In some patients the greatest lowering of the arterial pressure occurred within five to 10 days In one patient, aged 46 with severe stenosing arteriosclerosis of the temporal artery, the drop in arterial tension was insignificant and only temporary, but in two women aged 30 and 33 with malignant hypertension and less pronounced arterial narrowing the drop in arterial tension was pronounced and prolonged For the first two weeks after the intervention the urinary 17 ketosteroids must be determined repeatedly Although neither acute nor subacute adrenal insufficiency was observed in the authors patients the 50 to 60% diminution of the 17 ketosteroids suggested considerable temporary inhibition of the adrenal cortex *It seems therefore necessary to administer* 25 to 30 mg of desoxycorticosterone acetate and extracts of total adrenal cortex in oily solution for three days before the intervention and for a period after the intervention until the normal 17 ketosteroid level has been restored As a rule Thorn s test should be performed before and after each sclerosing intervention, since administration of cortisone may be required in certain cases Because of the anatomic disposition of the adrenal medulla, its complete and elective destruction without impairment of the cortex may not always be obtained but when done cautiously this intervention may be a valuable adjuvant of conservative treatment and of Smithwick s operation for arterial hypertension

*Treatment of Localized Choreo-Athetosis by Resection of the Motor Cortex. J R Boixadós.—p 228
*Cholecystography by Oral Administration of Tetraiodophenolphthalein J Sánchez San Julian and A Pascual y Mejías—p 232
Typhobacillosis and Tuberculous Meningitis J J Herrera Rojas—p 242

Treatment of Localized Choreo Athetosis by Resection of Motor Cortex—Boixados obtained good results from resection of an area of the contralateral motor cortex by Bucy s technique in various cases of involuntary movements and in a case of unilateral choreo athetosis of the right arm and right foot This case is reported in detail The author states that the contralateral motor cortical area to be resected should be delimited by electrical stimulation during the operation and that resection of the delimited area should be ample Repeated electroencephalograms should be taken after the operation The findings of abnormal waves and abnormal rhythms in the electroencephalograms, indicating the possibility of development of epileptigenic foci in the future are indications for prolonged administration of anticonvulsive drugs In the case of choreo athetosis reported by the author the condition had lasted for 16 years The operation resulted in perfect control of involuntary movements and almost total recovery of normal movements The patient had only one attack of Jacksonian epilepsy, which occurred a few months after the operation and was controlled by anticonvulsive treatment Good results are maintained up to now eight months after the operation

Cholecystography by Oral Administration of Iodophthalein—Sanchez San Julian and Pascual y Mejías performed cholecystographies with iodophthalein administered orally to 209 patients of either sex with diseases of the gallbladder and of the liver The test gave positive results in 167 patients (80%) The authors found that the percentage of positive results is higher when cholecystography is performed after oral administration of iodophthalein than when iodoalphionic acid (priodax®) is given or when iodophthalein is given other than orally The authors stress the need for a careful technique in cholecystography

Typhoid Like Bacillemia in Tuberculous Meningitis—According to Herrera Rojas tuberculous meningitis and miliary tuberculosis in young persons are preceded by a long period of tuberculous septicemia The clinical symptoms are those of a bacillary infection The clinical course is similar to that of typhoid Erythema nodosum is present in all cases of this type that show spread of tuberculosis, and the Pirquet tuberculin reaction is strongly positive The positivity diminishes or disappears if intercurrent infection develops The diagnosis of tuberculous bacillemia is mainly based on (1) the clinical course of this period of the disease, (2) the presence of erythema nodosum and (3) the positive results of the Pirquet tuberculin test and the results of the roentgen examination of the chest Streptomycin administered in the period of tuberculous bacillemia prevents spread of tuberculosis and tuberculous meningitis

Adrenocorticotrophic Hormone and Bronchial Asthma A Morelli and M Mazella Di Bosco—p 365
*Late Changes in Blood Picture Following Gastric Resection D Mainiero—p 367
Comparative Studies on Measurement of Allergy from Intradermal and Percutaneous Reactions F Nuti and A Cherubini—p 370
**Clinical Study of Post Transfusion Hepatitis* L Magnanelli—p 378

Late Blood Changes Following Partial Gastrectomy—A study was made on 20 patients four to 14 years after they had undergone partial gastrectomy The amount of hemoglobin and the number of red blood cells were compared with the preoperative values The author considered 4,500 000 as the lowest normal limit for red blood corpuscles and 90% for hemoglobin The number of erythrocytes was above 4,500 000 in 15 cases between 4 000 000 and 4 500,000 in three cases and under these figures in two cases It increased in 12 patients did not change *in six* and *slightly diminished in two* Hemoglobin was 80% or above 80% in all cases it increased in 11 patients and slightly diminished in nine Mainiero concludes that anemia following gastric resection is very rare, even a long time after the operation In cases in which it does occur it may be determined by factors that were present before or at the time of the intervention

Post Transfusion Hepatitis.—Of 220 persons who had blood transfusion and who were discharged from the hospital of an Italian region where viral hepatitis has been present for several years jaundice developed *in* 10 *(4 5%)* after an average incubation period of 50 to 100 days from the transfusion time In onset and clinical course the disease was similar to, but milder than acute infectious hepatitis However these cases could not be classified as spontaneous viral hepatitis because of the long period of incubation Nor could they have been caused by infection occurring after the patients were discharged, because the disease developed in one person who was not living in the infected section of the country At the time of the transfusion six of the 10 patients had diseases involving liver disturbances

Also, of 4,100 who did not have blood transfusions and who were discharged from the same hospital only one woman showed this type of jaundice She had been given calcium intravenously, and this case was classified as jaundice "from syringe" Thus, *the author concludes that the 10 patients had post-transfusion* hepatitis and that the number of healthy carriers of the icterogenic virus is large He suggests a thorough examination of the donors' conditions, with the exclusion of those who have had, or show signs of, liver disturbances Instruments should be autoclaved for 15 minutes at 150 C or dry sterilized for one hour at 160 C

Conservative Treatment of Thrombosis and Embolism in Gynecology and Obstetrics Compared to Anticoagulant Therapy W R. Merz, M Etterich and C Scacchi —p 565
*Studies on Hyperventilation Tetany Simplification of Pathogenesis of Tetany (Concluded) K Lenggenhager —p 568

Hyperventilation Tetany —Total conduction anesthesia of all the nerves of the hand by the administration of a 2% procaine hydrochloride solution was produced in healthy persons between the ages of 24 and 30 With the persons experimented on in recumbent position, hyperventilation tetany then was produced by maximum rapid and deep breathing, but the anesthetized and completely motor paralyzed muscles of the palm remained flaccid During hyperventilation the subjects, however, experienced pronounced formication in the completely paralyzed and totally anesthetized hand It was thus demonstrated that this formication was projected from the center (brain) to the periphery Pronounced psychic disturbances occurred rapidly in the course of hyperventilation even before the occurrence of tetany These were revealed by writing tests These disturbances further prove that hyperventilation tetany is mediated by the brain Hyperventilation tetany has no primary connection with oxygen deficiency and alkalosis but depends on the diminution of the blood calcium ions in the presence of a normal total calcium content resulting from the pronounced pH deviation to the alkali side This was proved by the observation that tetany subsided soon after the administration of acid (5% carbon dioxide in the inspired air), while calcium injections given during hyperventilation were ineffective The concept that respiratory tetany depends on the diminution of the ionized calcium also applies to the tetany resulting from parathyroid hormone deficiency That other forms of tetany do not yet seem to fit this concept may be due to the lack of satisfactory methods for the determination of the degree of ionization of blood calcium, to incomplete knowledge of the inhibiting effect of alkalies on calcium ionization, or to the fact that tetany may be elicited, without decreased calcium ionization, by central noxae acting on the same area of the brain that is affected by calcium deficiency (intoxication tetany due to guanidine) The absence of the prolonged S T interval in the electrocardiogram taken in persons with hyperventilation tetany should not be used as an argument against the concept of diminished ionization of calcium, because the constantly working heart muscle produces enough locally effective lactic acid to restore the deficient ionization of the hyperventilation-calcium to near normal

Study of Certain Multilobular Gallbladders J Caroli A Paraf and Beaugrand —p 1776
*Treatment of Cirrhotic Ascites by Fractional Tapping at Short Intervals. J Caroli and A Paraf —p 1786

Treatment of Cirrhotic Ascites —In patients with cirrhosis of the liver associated with pronounced ascites and edema of the lower extremities, *respiratory and gastrointestinal* distubrances, oliguria and anorexia, one should attempt first to restore the distended abdomen to its normal condition and to maintain the latter by the technique of fractional and repeated tapping A strictly salt-free diet may be employed only as an adjuvant The authors do not share the view of other *hepatologists that* paracentesis should be done at very long intervals and as rarely as possible, because it then requires the removal of large amounts of fluid, which probably causes hypotonicity of the interstitial fluid, thus favoring cerebral edema and causing coma and death Treatment by repeated small punctures should be divided in two periods as follows during the first 10 to 15 days, 1½ to 2 liters of fluid should be removed daily, so that a larger fraction than that formed each day is removed At the slightest sign of intolerance, such as abdominal pain with or without diarrhea, smaller amounts of fluid should be removed During the second period, that of maintenance, as much fluid should be drawn off as is formed each day or two, i e, ½ to 1 liter Experience with this method of treatment in 21 cirrhotic patients with pronounced intractable ascites suggests that they are no longer invalids, it became possible to place them on a high caloric and protein diet providing adequate alimentation *with satisfactory digestion* Edema disappeared completely and permanently In one of the patients 111 liters of ascitic fluid were removed in 33 tappings in the course of eight months Although 1,110 gm of proteins were removed, they were compensated for by the better alimentation made possible by this method of treatment The amount of water and of electrolytes removed was equal to that usually eliminated by mercurial diuretics, which often are not well tolerated by cirrhotic patients, in whom the diuretics may become ineffective more rapidly than in cardiac patients Four patients were therapeutic failures and death resulted after four to nine weeks of treatment Necropsy revealed massive and irremediable destruction of the liver parenchyma despite drying up of the ascites The authors caution against treatment with repeated fractional tapping in patients with refractory anorexia

Streptomycin and P A S Sensitivity in Tuberculosis Rapid Method for Testing Numerous Specimens Preliminary Report A M Beemer —p 357

Carbon Tetrachloride Poisoning by Inhalation —The patient whose case is presented had inhaled carbon tetrachloride on Dec 1, 1950, while cleaning electrical equipment with a carbon tetrachloride spray Soon after inhalation he felt faint and dizzy, and he vomited, about 15 minutes later he complained of severe frontal headache Three days later jaundice appeared and the liver was found to be tender and enlarged The jaundice became more severe, purpuric spots developed all over the body and there were recurrent attacks of epistaxis The urinary output was low and contained albumin Dyspnea developed, vomiting continued, and the patient died 12 days after the inhalation of carbon tetrachloride, despite adequate treatment Necropsy corroborated the belief that this poison attacks the kidneys, liver and lungs The severe hemorrhagic pulmonary edema was regarded by the author as the *principal* cause of this patient s death Acute hepatic insufficiency and toxic nephrosis were considered to be contributory factors The author s analysis of the cases that have been reported in the literature indicates that there is a greater percentage of renal symptoms in cases of poisoning due to inhalation After carbon tetrachloride has been ingested, the concentration of this substance will be greater in the portal circulation, and, as a consequence, hepatic involvement will predominate

Accidental Intraarterial Injection as Complication in Intravenous Anesthesia K. D Carlsen —p 492
Allergic Rhinitis on Basis of Focal Infection E Strandbygård —p 493

Fluid Therapy.—Friis Hansen discusses the composition of extracellular and intracellular fluid under normal conditions and the shifting in the fluid and salt metabolism that occurs in different diseases, together with the development of rational fluid therapy based on these relations Possible shock in a dehydrated patient is treated with blood or plasma transfusions An initial dehydration is undertaken with a combination of salt solution (0 9% sodium chloride) and 5% glucose, corresponding to about ha'f of the fluid quantity the patient is believed to need, preferably given intravenously Possible acidosis or alkalosis is corrected with sodium bicarbonate or salt solution Continued rehydration is carried out with salt solution glucose salt solution or Darrow s fluid in more chronic forms of dehydration Darrow s fluid is given subcutaneously or slowly intravenously Maintenance therapy covers the daily need of water and electrolytes with salt solution Darrow s fluid and 5 or 10% glucose as a calory source Electrolyte and glucose solutions can advantageously be combined when given intravenously, making the calory administration more continuous With parenteral fluid therapy of longer duration, vitamins B C, and possibly K are added to the infusion fluids The many pulmonary edemas that have occurred from overdosage of salt solution or sodium bicarbonate emphasize the need of caution it is better to give too little than too much As soon as possible the patient should take his fluids by mouth

Establishment of Tubercle Bacilli in Seminal Fluid T Hølund.—p 632.
Effectiveness of Antimycotic Treatment of Athlete s Foot P V Marcussen —p 633

Streptomycin Treatment of Tuberculous Meningitis and Miliary Tuberculosis.—Fifty patients with disseminated tuberculosis were treated with streptomycin The average observation time for all surviving patients was 28 months Lassen and Neukirch say that recovery resulted in four of the six patients with miliary tuberculosis only in 11 of the 32 with tuberculous meningitis, and in two of the 12 with both tuberculous meningitis and miliary tuberculosis Of 20 patients with tuberculous meningitis given only intramuscular streptomycin treatment, seven recovered, of 12 treated both intrathecally and intramuscularly four recovered The one patient with both tuberculous meningitis and miliary tuberculosis who received streptomycin intrathecally and intramuscularly died The results of exclusively intramuscular treatment with streptomycin in this series were thus as good as those of intrathecal and intramuscular treatment The prognosis is most unfavorable in combined tuberculous meningitis and miliary tuberculosis In the surviving patients the vestibular function was destroyed, the three adults but not the children were noticeably troubled by dizziness Calmette vaccination had not been done in any of the patients No case of disseminated tuberculosis has been seen in the Copenhagen tuberculosis station in persons in whom Calmette vaccination was done and followed by positive tuberculin reaction Thus, it would appear that Calmette vaccination of all tuberculin negative persons would prevent the occurrence of tuberculous meningitis and miliary tuberculosis

*Surgical Treatment of Mitral Stenosis Its Indications and Results E D Gagnon and P David —p 660
Modern Lighting and Ocular Pathology E Blain —p 675
Treatment of Tuberculous Meningitis with Streptomycin. J L. Desrochers —p 677

Commissurotomy for Mitral Stenosis.—The authors have modified the Glover, Bailey, and O'Neill commissurotomy technique by inserting the blade of the commissurotomy guillotine knife between the right hand glove and a second glove finger worn on the index finger This technique was used on five men and two women, between the ages of 17 and 28 with buttonhole mitral stenosis Two patients died, one within 48 hours after the intervention and the other on the fifth postoperative day In the first the post mortem examination revealed that the median incision had been made somewhat anterior to the commissure, producing a possibly too pronounced mitral insufficiency for which the left ventricle was unable to compensate In the second case the incisions were made just at the axis of the commissures, and the cause of death could not be satisfactorily elucidated It is too early for evaluation of late functional results of the commissurotomy in the five surviving patients, but the authors were impressed by the pronounced improvement of the condition of two of the patients who had been followed up for 13 and 12 months respectively after the intervention Both are able to do work adapted to their cardiac capacity Early results in the three other patients who survived the operation are promising The presence of rheumatic activity or of involvement of other valves, particularly the aortic valve, *constitutes a definite contraindication to the operation* Mitral insufficiency was associated with the stenosis in two of the authors patients, but in only one of them was the result of the operation unsatisfactory Thus the indication for operation in cases of this type remains debatable Calcification of the mitral leaves does not constitute a contraindication to the intervention It seems advisable to perform commissurotomy as early as possible when the first signs of pulmonary congestion are manifested and before the occurrence of permanent changes in the parenchyma and particularly in the pulmonary vessels Severe hemoptysis does not constitute a contraindication to commissurotomy but an attempt should be made to restore cardiac compensation before the intervention Auricular fibrillation is not a definite contraindication but its occurrence warns of the possibility of a thrombus in the auricular appendage Despite the need for improvement of the technique, commissurotomy is the only method of treatment by which encouraging results may be obtained at present in a large number of cases of mitral stenosis

BOOK REVIEWS

Growth and Development of Children By Ernest H Watson M D Associate Professor and George H Lowrey M D Instructor Department of Pediatrics and Communicable Diseases, University of Michigan Medical School, Ann Arbor Cloth $5 75 Pp 260 with 54 illustrations Year Book Publishers Inc 200 E Illinois St Chicago 11 1951

Here is a most practical and useful book for those concerned with the care of children Originally started as a manual of factual data it has been expanded through the comments and additions of its users at Ann Arbor, as well as authorities elsewhere in this field, to consist of a small book, remarkable for its condensed, orderly presentation of up to date knowledge of the physical and mental development of children The subject coverage extends from a consideration of prenatal influences on the organism to include all potential influencing factors to the time of adolescence The growth of various organ systems is traced in categorical fashion making reference facts readily accessible by frequently used outline format and an abundance of charts and graphs In some instances, the abnormal variations of development are considered with charts showing the possible etiological factors and the studies needed for clinical differentiation

As is so welcome in a handy reference book, little discussion is made The facts are readily found and are supported by a well selected bibliography following each section, which permits the reader to pursue more thoroughly any point of interest With much of its presentation in the popular outline tabular form, this book is unique in its subject field It is complete in its coverage of the subject, although necessarily brief, and can be recommended highly for use by those new to or even experienced in the field of pediatrics

Research in Medical Science Edited by David E Green Ph D and W Eugene Knox M D Cloth $6 50 Pp 492 with 15 illustrations The Macmillan Company 60 5th Ave New York 11 1950

The various chapters in this book were written by authorities in particular fields of medical research Thus, as the editors point out in their introduction the general subject is not treated in a well integrated or orthodox fashion, and not all aspects of research in medical science are covered Chapters are devoted to such topics as the methodology of medical genetics and biochemical problems in sanitary engineering, as well as to the general subjects of viruses, chemotherapy, and neurology The style of presentation of the contributing authors lacks uniformity, but one finds this seeming defect somewhat refreshing rather than distressing In general, an attempt was made to survey the methods and problems as well as the recent accomplishments in particular fields of medical research and to discuss them in terms that could be easily understood by the nonspecialist Indeed the well informed layman would find much of the book to be completely intelligible It should be especially worth while and interesting reading for those clinicians, basic scientists, and medical students who may not have a full appreciation of the increasingly close relationship of clinical research to the fundamental sciences

On the Nightmare By Ernest Jones M D Second Edition Cloth $4 95 Pp 374 Liveright Publishing Corporation 386 4th Ave New York 16 1951

The author attempts a definitive study of the nightmare, introducing evidence from psychiatry, history, literature and mythology As a result of these investigations, he has evolved a theory that concerns the relationship between religion and the burden of guilt that everyone supposedly inherits from a primordial conflict arising from repressed incestuous wishes Phenomena of the nightmare are considered to be due to the invocation, by all peoples and all faiths through the ages, of mythological creatures such as werewolves, vampires incubi and succubi, devils, and witches, as projections of guilt The author cites two essential attributes of the nightmare 1 It arises from within 2 It is of mental origin, a sexual wish in a state of repression In this respect, the nightmare supposedly differs from ordinary erotic dreams only in that the erotic wish has been repressed He concludes that if the wish were not repressed, fear would not be associated with the dream

The book is presented in four parts The author states that much of parts 1 and 2 has previously appeared in the English and German literature In revising these for this book he has rearranged the material presented and added confirmatory material from his own professional experience

Destructive and Useful Insects Their Habits and Control By C L Metcalf M A D Sc and W P Flint Revised by R. L Metcalf M.A. Ph D Associate Entomologist University of California College of Agriculture Riverside California Third edition Cloth $10 Pp 1071 with 584 illustrations McGraw Hill Book Company Inc 330 W 42d St New York 18 Aldwych House Aldwych London W C 2 1951

This book has been widely accepted as a standard reference on economic entomology The first 10 chapters are devoted to the fundamentals of technical entomology while the remaining 13 chapters are given over to the major crop insects in the United States and southern Canada A table or key to help the reader identify a particular pest when the plant or animal attacked is known, introduces each chapter in the latter part of the book The discussions of the various pests include statements on the recognition marks and types of injury life history and significant habits and the control measures believed to be effective

The vast number of changes that have occurred in insect control during the past decade have been largely incorporated into the present edition This has necessitated the revising of several sections to include recent knowledge on insect biochemistry and physiology and a revising of information on diseases transmitted by insects New sections have been added on insect nutrition and pigmentation, new chemicals, and methods of application improved formulations, insecticide resistant insects and current control practices The subject matter is comprehensively covered in a clear and direct manner This book is to be recommended as a useful reference manual for entomologists, farmers, gardeners physicians, pest control operators, and general readers who desire practical information on insect pests, their habits and their control

Handbook of Diagnosis & Treatment of Venereal Diseases. By A E W McLachlan M B Ch B D P H Consultant in Venereal Diseases Bristol Clinical Area Bristol. Fourth edition. Cloth $4 50 Pp 368 with 160 illustrations. Williams & Wilkins Company Mount Royal and Guilford Aves Baltimore 2 1951

Events have developed so rapidly in the treatment of venereal diseases particularly in this country, that nothing so static as a book can keep altogether current with the times Although it makes a valiant effort to do so, this book falls short in some respects The author is fully aware of the growing tendency in the United States to rely on penicillin alone for the treatment of syphilis and he recognizes also the place of the newer antibiotics for the treatment of other venereal diseases It is apparent, however that experience in Great Britain with these drugs lags somewhat behind that in this country, and, as a result, the author still relies on combined treatment with antibiotics and the heavy metals for syphilis Aside from the field of treatment this little book is excellent It is well written, adequately illustrated and indexed, and there are clear descriptions of such subjects as diagnosis laboratory findings, clinical picture, and differential diagnosis

Enterobacteriaceae Collected Studies on Salmonella Arizona Ballerup Bethesda, Escherichia Alkalescens-Dispar, Klebsiella, Shigella Providence and Proteus By F Kauffmann M D Chief International Salmonella and Escherichia Centre Statens Seruminstitut Copenhagen. Cloth $7 50 50 schillings. Pp 338 Ejnar Munksgaards Forlag Nørregade 6 Copenhagen K 1951

Dr Kauffmann has been known to American laboratory workers for more than 20 years because of his extensive studies of salmonellas Many of these were carried out in cooperation with Dr P R Edwards of the United States Public Health Service, to whom this book is dedicated

The volume contains a collection of valuable data scattered in periodicals on Enterobacteriaceae among which many genera are of medical interest Salmonellas (including the typhoid bacillus) occupy the first and best part of the book Bacteria maintaining a position between salmonellas and colon aerogenes organisms have been called paracolon bacilli for a long time They appear in this volume as the Arizona Ballerup and Bethesda groups, which however do not include all paracolons The clinical pathologist still will not know how to label a slow lactose fermenting Enterobacteriacea which forms indol Further chapters on Escherichia and Klebsiella further increase practical dilemmas The Friedlander bacillus (Klebsiella pneumoniae) has been classified with aerobacters during recent years, a concept which is acceptable by the bacteriologic taxonomist but difficult for the medical practitioner to understand who has to receive an explanatory note from the medical laboratory Klebsiella isolated from the urine or Aerobacter isolated from the sputum ' While the occurrence of aberrant strains is shown in the text the table demonstrating biochemical group diagnosis on page 16 flatly states that Escherichias do not form hydrogen sulfide and are motile, while Klebsiellas are not motile Daily practical experience especially in the United States does not allow such generalizations One has to wonder why the pioneer work of Levine, Winslow and co workers Parr Stuart and co workers and others should fall now into oblivion The author refutes the classification of Shigella alkalescens with the genus Shigella and puts this organism together with Shigella dispar, into a special group between Escherichia and Klebsiella This is justified by the serologic relationship of Sh alkalescens and Sh dispar to some Escherichia coli strains but not from the point of view of the medical bacteriologist The following chapter, on shigellae, constitutes an excellent part of the book especially the comparison of the confusing nomenclatures The pages devoted to the Providence group include a review of organisms standing between paracolons and protei The chapter on protei suggests the unification of Pr vulgaris and Pr mirabilis (ammoniae) under the name of Pr hauseri Again one would like to see more emphasis on biochemical characteristics of the species The following pages are devoted to the reciprocal antigenic relationships and the final chapter lists a number of mediums useful for the isolation of Enterobacteriaceae While the list contains the obsolete Drigalski plate one misses MacConkey s and Levine s very popular mediums A list of references in alphabetic order ends the book There are many additional quotations in the text marked with index numbers some of them are found in the particular chapters and others are entirely missing

This book contains a wealth of material based chiefly on the observations of Kauffmann Edwards Stuart and Wheeler and their co workers It is a valuable source book for the bacteriologist who is specializing in Enterobacteriaceae Since biochemical properties of the organisms, which form the base of their classification in routine laboratory work are treated as secondary characteristics and medical veterinary or sanitary aspects are neglected one cannot recommend this volume as a laboratory aid for a nonspecialized institute It should be however read by those interested in this field of bacteriology

While the work of Dr Kauffmann is most laudable and important one must accept this book also as a memento showing the increasing necessity of practical medical bacteriologists and clinical pathologists taking a firmer stand in the question of naming renaming classifying and reclassifying bacteria of medical importance

Letters of Benjamin Rush Volume I 1761 1792 Volume II 1793-1813 Edited by L. H Butterfield. Published for American Philosophical Society Memoirs of American Philosophical Society Held at Philadelphia for Promoting Useful Knowledge Volume 30 Part I Cloth $15 per set Pp 624 627 1295 with illustrations Princeton University Press, Princeton N J Oxford University Press Amen House Warwick Sq London E.C 4 1951

Benjamin Rush probably was the 18th century s most distinguished American physician He was also a politician social reformer psychiatrist church founder college founder and pamphleteer He was one of the signers of the Declaration of Independence These excellent volumes contain a collection of more than 650 letters written by Rush many of which were never before printed His correspondents included five Presidents of the United States Benjamin Franklin leading figures in science members of his family including his mother in law and friends Rush s fame sprang from his vigorous and magnetic personality from his accomplishments in medicine education and social reform from his work as a teacher and lecturer and from his letter writing He preferred writing letters to eating in fact, he once suggested that eating clubs should be prohibited He stored up everything he saw read or heard about that might prove useful to someone and he talked and wrote for the relief of his mind Rush s letters were marked by an indiscretion that was relished by his correspondents His correspondence with John Adams is especially extensive and interesting The editor of these volumes L H Butterfield of Princeton says to the deepest and finest of all of Rush s friendships that of John Adams this collection is a monument Rush s letters written to his wife his children his patients and others during the great epidemic of yellow fever in Philadelphia about 1762 are of great interest particularly with reference to the treatment of a disease of which the cause was then unknown While these letters are of special interest to physicians they can be read with profit by others interested in the early history of the United States

Social Pathology A Systematic Approach to the Theory of Sociopathic Behavior By Edwin M Lemert Cloth $4 50 Pp 459 with illustrations. McGraw Hill Book Company Inc 330 W 42d St New York 18 Aldwych House Aldwych London W C 2 1951

This book written by a professor of sociology, deals in general with aberrations or deviations from normalcy in human society such as crime and prostitution or other pathological phenomena or maladjustments in social behavior This clearly shows that the term "pathology is borrowed from medicine and applied to sociology and therefore social pathology in this sociological sense differs from the strict medical usage of the term where social pathology means the relation between genuine disease (e g , tuberculosis cancer venereal diseases or rheumatic fever) and social-environmental conditions This latter interpretation of social pathology or the social etiology of diseases and their varying prevalence in different social groups as is shown by medical statistics forms the theoretical foundation of social medicine As a medical discipline in its own right, social pathology has found special representation nowadays in England through a number of academic chairs (as at Oxford Edinburgh Birmingham and Sheffield) occupied by clinicians and public health workers, after similar developments some decades earlier in the German speaking and French speaking countries

With this new medical discipline as a systematic quantitative investigation into the social relations of all diseases Lemert s social pathology has little in common However certain chapters in the borderline area between social science and medical science such as Blindness and the Blind Speech Defects and the Speech Defective and Drunkenness and the Chronic Alcoholic which are more or less documented by statistics and show the deviation from normal behavior have beyond doubt great medical interest other chapters such as Prostitution and the Prostitute Crime and the Criminal also deserve medical attention because of their close connection with medicolegal and social problems while the chapter Radicalism and Radicals, enters political sociology, showing the differentiation of radical groups from the average "normal" population Thus, from a broader point of view, this new book, with its pertinent footnotes and references, an outline of case history studies, and a glossary of terms in the appendix will find interested readers also *in the medical profession, though the underlying theory* as expounded in several chapters in Part 1 of the book may require special familiarity with sociological concepts Among these the chapter on deviation and differentiation in society shows that the author is well aware that establishing or describing norms or normal behavior is more difficult in societal reactions or sociological characteristics of groups than in the biological traits of these groups

Enzymes and Enzyme Systems: Their State in Nature. Edited by John T Edsall With contributions by A L Lehninger and others Cloth $2 75 Pp 146 with illustrations Harvard University Press Cambridge 38 Massachusetts 1951

To this first volume of memoirs from Harvard University s Laboratory of Physical Chemistry Related to Medicine and Public Health, eight experts contribute chapters on various aspects of the physical chemistry of enzymes The work grew out of a symposium held in July, 1949, and is intended to stimulate interest in the field and further research rather than to serve as a definitive monograph

Lehninger and Green have chapters on the behavior of enzymes in mitochrondia, Emil Smith writes of the role of metals in the action of enzymes, Maehly describes the splitting of peroxidase and its resynthesis from the split products, Chance discusses the thermodynamics of some heme enzymes, and, in the last chapter, Cohn, Surgenor, and Hunter consider the state in nature of proteins and protein enzymes of blood and liver The printing and binding are worthy of a university press

The Polarographic Method of Analysis. By Otto H Müller Associate Professor of Physiology State University of New York Medical Center at Syracuse Syracuse N Y *Contributors to Chemical Education* No 2 Second edition Cloth $3 50 Pp 209 with 51 illustrations Chemical Education Publishing Co Easton Pa 1951

This book was written to present the subject of polarography in such a manner that it would be of practical value for students and teachers in physical chemistry and also serve for advanced *specialized study in analytical chemistry*

The first chapter discusses the various electro methods available for analysis The remaining seven chapters give details concerning the apparatus used discuss the fundamentals of qualitative and quantitative polarography, consider the recent developments and the *possible applications of this electro-analytical* method of analysis, and include some valuable suggestions for practical polarography The volume contains 26 experiments, which are designed to illustrate the various ideas discussed A brief bibliography and an index are also included

Bentley and Driver's Text Book of Pharmaceutical Chemistry Revised by John Edmund Driver M A Ph D M Sc *Professor of Chemistry in* University of Hong Kong Fifth edition Cloth $7 25 Pp 671 with 50 illustrations Oxford University Press 114 Fifth Ave New York 11 Amen House Warwick Sq London E.C 4 1951

This edition of this well-known and excellent British textbook has been rewritten to make it accord with the 1948 edition of the British Pharmacopoeia Because it is confined to B P products British methods of manufacture and the requirements of British students of pharmacy, it will have little use outside of the British Empire

Hypertension: A Symposium Held at the University of Minnesota on September 18, 19, and 20 1950 in Honor of Elexious T Bell M.D., Benjamin J Clawson, M D., and George E. Fahr, M.D Edited by E T Bell M.D Cloth $7 50 Pp 573 with illustrations University of Minnesota Press, Minneapolis 14 1951

This book consists of a collection of current reviews of clinical and experimental studies of hypertension by 25 leading clinicians and investigators in this field The 35 manuscripts and the several sections of discussions, questions, and answers were collected as a result of a three-day symposium The papers summarize well many *aspects of the* etiology, pathology, clinical *course, and treatment of this* disease. No effort is made to summarize the several studies or to outline classification and therapy The bibliography affords excellent reference to many early and recent publications The accumulated current studies and opinions of the essayists afford good orientation reading and stimulus for study to those investigating hypertension

A Primer for Psychotherapists By Kenneth Mark Colby M.D Adjunct in Psychiatry Mount Zion Hospital, San Francisco Cloth $3 Pp 167 Ronald Press Company 15 E. 26th St. New York 10 1951

This volume is intended to present, in simple form, elementary principles of psychotherapy for use of beginners in this field, particularly interns, residents in psychiatric hospitals and clinics, clinical psychologists, and psychiatric social workers Psychotherapy is presented not as an exact science but as a practical art in which general principles of scientific derivation are interpreted in accordance with the judgment of the individual therapist as they apply to each patient. The greater part of the book is concentrated on therapy of the neuroses, but there is a chapter on the specific differences in the approach to neurotic and schizophrenic patients The material throughout is illustrated by quotations from actual case reports

***The American Illustrated Medical Dictionary:* A Complete Dictionary of the Terms Used in Medicine, Surgery, Dentistry Pharmacy, Chemistry, Nursing Veterinary Science, Biology and Medical Biography with Their Pronunciation Derivation and Definition** By W A Newman Dorland A M M D F.A C S Lieutenant-Colonel M R.C U S Army Editorial Board Richard M. Hewitt, A M M D E. C L, Miller M.D Arthur H. Sanford M.A. M D Contributors Lloyd W Daly A.M. Ph.D Associate Professor of Classical Studies University of Pennsylvania Philadelphia, and Austin Smith C.M M D Editor Journal of the American Medical Association Chicago Twenty-second edition. Cloth. $10 Pp 1736 with 720 illustrations. W B Saunders Company 218 W Washington Sq Philadelphia 5 7 Grape St. Shaftesbury Ave London W C.2, 1951

Each edition of this great medical dictionary extends its wide reputation This edition has thousands of new terms that have been added to medical language and many new illustrations The new typography makes it more readable Other new features are a table of modern drugs and dosage and an article on fundamentals of medical etymology, which was prepared by Prof Lloyd Daly, of the University of Pennsylvania This edition appeared during the celebration of the semicentennial of this medical dictionary The publishers are to be congratulated

Adventure in Mental Health Psychiatric Social Work with the Armed Forces in World War II A Symposium by Betty P Broadhurst and others Edited by Henry S Maas. Cloth $4 50 Pp 334 Columbia University Press 2960 Broadway New York 27 1951

Contributors to this symposium are 16 social service workers, who give details of their work with the armed forces in World War II The book is in the nature of a report on what has been referred to as a significant period in the development and especially the recognition of psychiatric social work The book has three sections the first deals with psychiatric social work in the field, the second is headed upper echelon story," and the third presents implications for current civilian practice Numerous case histories accompany the discussions in the first section One appendix presents an outline of a mental hygiene unit for a replacement training center, another outlines treatment and training programs for psychiatry units Social workers in this field undoubtedly will find the volume helpful

A Few Buttons Missing: The Case Book of a Psychiatrist *By James* T Fisher M D and Lowell S Hawley Cloth. $3.50 Pp 282. J B Lippincott Company 227 231 S 6th St. Philadelphia 5 1951

This book is an informal presentation of the life and problems of a psychiatrist in 50 years of psychiatric practice The book appears to have been written *primarily for* the laity in an attempt to divorce psychiatry from the aura of confusion and mysticism that it bears in the thinking of the average *man*

The authors have illustrated their chapters throughout with selected anecdotes of a humorous and instructive nature, taken from actual patient experiences *Most of the material presented* is autobiographical, concerning the personal experiences of one of the authors, Dr Fisher, who graduated from Harvard in 1886 and entered practice in Los Angeles in 1904 Earlier, he had studied psychiatry in many of the capital cities of Europe during the developmental period of *Freudian* psychoanalysis

QUERIES AND MINOR NOTES

IDIOPATHIC HYPERLIPEMIA

To the Editor —*A young man, 19 was admitted to the hospital four weeks after receiving a smallpox vaccination on the left arm A necrotic ulcer 1 cm deep and 3 cm in diameter surrounded by an area of inflammation and accompanied by axillary lymphadenopathy was noted Clotting of a specimen of blood revealed serum that had the appearance of milk The specimen on standing for 24 hours showed a layer about 0 5 cm thick of milky substance overlaying clear serum Chemical analysis (fasting specimen) revealed on two occasions one month apart total lipids in excess of 4 000 mg per 100 cc The total cholesterol on both occasions was between 450 and 500 mg per 100 cc The total protein on admission was 9 7 gm with reversal of the albumin-globulin ratio These findings reverted to normal over a period of two weeks as the inflammatory process subsided under antibiotic therapy Repeated physical examinations and urinary and hematologic studies have revealed no abnormalities There is no evidence of lipemia retinalis It is now two months since the patient was discharged from the hospital as clinically well Weekly examinations of serum however reveal no gross change in its milky appearance This patient was inducted into the service about two months before his admission to the hospital at which time a routine serologic study was done It is assumed, therefore that he did not have lipemia when he entered the service What is the etiology mechanism and prognosis?*

M D Texas

This inquiry was referred to two authorities, whose respective replies follow —Ed

Answer —The etiology of diseases of abnormal lipid metabolism' is not well understood Most are regarded as due to defects in the latter phases of lipid assimilation and storage with consequent excessive accumulation of lipids carried through earlier normal steps of the lipid metabolic cycle In many instances, blood fat studies of a patient s family disclose cases of previously unsuspected and apparently symptom free hyperlipemia Adults with hyperlipemia may be divided into two groups prognostically 1 Apparently symptom free patients, without evidence of internal organ involvement but frequently with evidence of local skin deposits (xanthomas) The disease seems to follow a benign and chronic course with little or no change over a period of years 2 Patients with evidence of endocrinopathies or other metabolic disorders, such as hepatic disease, pancreatic disease, renal disease, diabetes mellitus, and hypothyroidism This group has a more limited prognosis, but many have a history of skin lesions for many years, suggesting pre-existing hyperlipemia of many years duration It is uncertain, in these latter cases, whether the associated condition is due to the hyperlipemia, to an independent disease, or to both

From the description given the case under discussion is one of essential hyperlipemia and merits a good prognosis That hyperlipemia was absent two months earlier is only an assumption Trauma has been thought by the dermatologists to favor appearance of xanthomas in the area of insult In some cases acute infections have preceded recognition of the disease

References

Thannhauser S J Serum Lipids and Their Value in Diagnosis New England J Med 237:515 (Oct. 2) 1947 237:546 (Oct. 9) 1947

Thannhauser S J Lipidosis Diseases of the Cellular Lipid Metabolism pp 257 287 Oxford University Press 1950

Answer —This young man has hyperlipemia of the type described by Thannhauser as "idiopathic hyperlipemia of adults with and without secondary eruptive xanthomas and occasionally accompanied by slight glycosuria Apparently secondary hyperlipemia occurring after smallpox vaccination has not been reported in the literature Since the patient is physically healthy it may be assumed that he has primary, not secondary, idiopathic hyperlipemia

It is assumed that at the service induction two months prior to hospital examination, the hyperlipemia was overlooked The mechanism of idiopathic hyperlipemia is similar in its mechanism to prolonged postprandial hyperlipemia Fat is correctly absorbed but does not go out through the capillaries, to the places of metabolism at a normal rate Therefore, the name retention hyperlipemia ' was coined for this condition The prognosis is very good These patients are not inclined to have premature arteriosclerosis They react promptly to a low-fat, low-caloric diet for example, 1,200 calories with 20 to 30 gm of fat

CHOLINE AND INOSITOL IN FAT METABOLISM

To the Editor —*May I have information on the best form of choline and inositol medication in disturbance of the fat metabolism and fatty liver degeneration? Please suggest special products or combination of products and their doses for adults Could their continued use be harmful?*

M D New Jersey

Answer —Choline and inositol medication is very questionable in its therapeutic effect in fatty livers as well as in fat metabolism in humans The experiments of Best and co-workers were conducted on rats with deficiency disease and fatty livers The effects of choline on rats are apparently different from those on humans It should not be assumed that favorable effects upon the fatty livers of choline deficient rats can be expected in the same way in humans with fatty livers of various etiologies A clear-cut effect of choline and inositol, or so-called lipotropic substances, in humans has not been reliably elicited For this reason, the question of which product, or combination of products, is advisable cannot be answered That these substances are harmful, apparently has not been reported However, their usefulness is very much doubted except in very rare deficiency diseases

AZOOSPERMIA

To the Editor —*What treatment would you follow with this patient? He is 26 years old and has never had any remarkable illness Examination reveals him to be normal except that the testes are probably a little smaller than normal He has normal libido and normal sex function Repeated examination of the ejaculatory fluid reveals no spermatozoa*

M D Virginia

Answer —Azoospermia may be due either to nonproduction of spermatozoa in the testicles or to a blockade somewhere in the duct system, most often in the epididymides The first step in differential diagnosis should be a testicular biopsy If normal spermatogenesis is present, the diagnosis of a blockade becomes obvious One then examines the epididymides to see whether there is a region that contains spermatozoa The patency of the ductus deferens may be investigated by injection or probing While the results of epididymovasostomy are often disappointing there is everything to gain and little to lose by trying this operation in suitable cases

On the other hand a biopsy may show that the seminiferous tubules are not functioning If the germinal epithelium appears normal, treatment should consist principally of systematic regulation of hygiene and the administration of thyroid in dosage sufficient to maintain the basal metabolic rate at about + 10 Other endocrine therapy is of doubtful value but gonadotropins might be tried empirically If the seminiferous tubules prove to be hypoplastic degenerated or atrophied, no treatment will help the patient

The answers here published have been prepared by competent authorities They do not however represent the opinions of any official bodies unless specifically stated in the reply Anonymous communications and queries on postal cards cannot be answered Every letter must contain the writer s name and address but these will be omitted on request.

LATENT SYPHILIS

To the Editor:—*A farmer in his early thirties came to me because of sharp sticking pains in the chest. Aside from the usual diseases and injuries of childhood and an appendectomy at age 24, a history of syphilis was discovered through a routine blood test in 1942. He had no knowledge of a primary sore and states that the physician at that time raised the question of congenital syphilis. He was given alternating courses of neoarsphenamine and bismuth continuously from March 1942 until April 1, 1944, but the Wassermann reaction has remained definitely positive. The titer of a blood specimen taken a few days ago showed a reaction of 1:16. He is married and has two healthy children. The wife's Wassermann reaction is negative. The electrocardiogram and x-ray and fluoroscopic examination of the heart reveal no definite variations from normal. Please suggest any further examinations that should be made. Should he receive antisyphilitic treatment?*

Ray S. Wycoff, M.D., Lexington, Neb.

Answer.—The diagnosis of congenital syphilis in the young farmer in question would rest, first, on the presence or absence of lesions or stigmas of the congenital disease in himself and, second, on an epidemiologic investigation of his parents and siblings. In any case in which there is a reasonable suspicion of congenital syphilis, such an epidemiologic study should be carried out. It does not appear that the patient's spinal fluid has as yet been tested. This is obligatory in all patients with syphilis. The laboratory examination should include a cell count, performed within one hour after the lumbar puncture, quantitative protein determination, quantitatively titered complement fixation test and colloidal test. If the spinal fluid is abnormal, the patient certainly needs more treatment. If it is negative, the question of additional treatment is largely a matter of psychotherapy.

The treatment of latent syphilis is entirely preventive and prophylactic. The amount of treatment necessary cannot be judged by the response of the blood serologic test, which, in patients whose treatment is begun late in the course of the infection, usually remains positive. Both the patient and the physician should understand the significance of seroresistance, and both are advised to read Moore's "Seroresistance (Wassermann Fastness) in Syphilis: A Discussion for the Patient" (*Am. J. Syph., Gonor. & Ven. Dis.* 30:125 [March] 1946).

Assuming the patient's spinal fluid to be abnormal, he should then receive 6,000,000 to 10,000,000 units of penicillin, which may be given as procaine penicillin in oil with 2 per cent aluminum monostearate, 600,000 units every second or third day to the total indicated.

If the spinal fluid is normal, there is little or no point in the administration of penicillin unless, as suggested above, for psychotherapeutic purposes.

With regard to the sharp sticking pains in the patient's chest, it would seem desirable to obtain a roentgenogram of the cervical spine in the lateral position and in flexion and extension, since a ruptured intervertebral cervical disk may cause symptoms of this sort.

RETROLENTAL FIBROPLASIA

To the Editor:—*I have to present a discussion of retrolental fibroplasia soon and there are some points that I have not been able to clarify in the literature. Is it still felt that the administration of iron and the water-soluble vitamins may play some role in the inception of this process? Has not the use of vitamin E been abandoned? Is Terry's opinion that early exposure to light may be significant still held? Is there any explanation of why full term infants usually or always have unilateral involvement while premature infants have bilateral involvement?*

Carl H. Weatherly, M.D., Louisville, Ky.

Answer.—The etiology of retrolental fibroplasia remains completely obscure. The one significant positive fact of etiologic significance is its association with prematurity. None of the clinical observations that have purported to associate retrolental fibroplasia with specific nutrients has been adequately controlled. Recent experience has shown that the incidence of this condition may undergo sudden unexplained change. During the past year, for example, retrolental fibroplasia has become very rare in Chicago, where it had been fairly common previously. In New York City, on the other hand, there has been a great increase. It is obvious, therefore, that any clinical experiment designed to evaluate possible etiologic or therapeutic factors must be carefully controlled, preferably with alternate cases. Such an experiment has not yet been reported. Kinsey and Zacharias (*J. A. M. A.* 139:572-578 [Feb. 26] 1949) correlated the supplementation of the premature infant's diet with vitamin A and iron with an increase in incidence of retrolental fibroplasia, but adequate controls for this observation were lacking, and its etiologic significance has not received general acceptance. The claim that vitamin E could prevent the development of retrolental fibroplasia has also had to be abandoned, although Owens and Owens still maintain that it decreases the severity of the condition. The use of vitamin E was discontinued by Reese and Blodi (*Am. J. Ophth.* 34:1-24, 1951) after their demonstration that the disease occurred with equal frequency in two series of unselected premature infants, one treated with vitamin E and the other untreated. Hepner, Krause, and Davis (*Pediatrics* 3:824-828, 1949) concluded that early exposure to light is not an etiologic factor, since four of five infants whose eyes were bandaged at birth later developed retrolental fibroplasia. Their conclusion has been criticized, however, because the pathological changes did not develop until after the bandages were removed. The experiment is being repeated on a larger scale at the Columbia-Presbyterian Medical Center. The bilateral occurrence of retrolental fibroplasia in premature infants may be an indication of the systemic nature of the disorder. The unilateral disease that is observed in full term infants is not related to retrolental fibroplasia, although it is frequently confused with it. This condition has been termed persistent hyperplastic vitreous (Reese: *Arch. Ophth.* 41:527-549 [May] 1949).

HEADACHE, STOMACHACHE AND EMESIS

To the Editor:—*A girl 7, with two younger siblings apparently of normal intelligence, complains of frontal headaches and stomachache followed in 10 to 30 min. by vomiting, after which she sleeps about a half hour and awakens feeling perfectly well. The attacks occur two or three times weekly, bear no relation to food ingested and may occur in the middle of the night. She has had this for about two years, has had no severe febrile illness and no birth trauma or other cephalic injury. Physical examination reveals a pale blonde and slightly undernourished child about 2 in. (5.08 cm.) taller than average for her age. Results of other examinations, including neurological tests, are normal except that she has bilateral anterior cervical adenitis. Urinalysis, complete blood cell count and stool examinations are normal. Family history discloses no epilepsy, migraine or other encephalalgia but does reveal allergies on the mother's side. The child has been free of allergic manifestations. What would you include in the differential diagnosis?*

M.D., Illinois.

Answer.—The following conditions should be included in the differential diagnosis: gastrointestinal allergy, epilepsy, emotional disturbances, errors of refraction, nasal sinusitis, increased intracranial pressure, migraine, urinary tract colic (due, for example, to stone or ureteral obstruction), intermittent gastrointestinal obstruction, indigestion (especially fats) with pylorospasm, and intestinal parasites.

The following procedures should be carried out if they have not already been included in the examination: skin tests for foods or, better, elimination diets; stool examination for parasites and, if there is mucus, for eosinophils; electroencephalograms for evidence of epilepsy and x-ray of skull and nasal sinuses; fundoscopic and refractive eye examination, intravenous pyelograms and gastrointestinal x-rays with contrast media; investigation of other behavior disturbances or maladjustments at home, school or play, and trial of a fat-free diet and soft curd milk.

REACTIONS TO PENICILLIN

To THE EDITOR —*Are sensitivity reactions more common following orally administered or parenterally administered penicillin?* *Ronald Germain M D Albany N Y*

ANSWER —Sensitivity reactions of all types are much less common after orally administered penicillin than when the drug is given parenterally In a series of over 500 patients with scarlet fever treated with between 450 000 and 1 200 000 units of penicillin daily by mouth for between seven and 10 days, only one reaction of hypersensitivity was observed This was an instance of mild morbilliform eruption, which appeared on the seventh day of treatment and disappeared promptly and spontaneously There have been seen no fevers or other sensitivity reactions with orally administered penicillin The usual incidence of reactions when the antibiotic is given parenterally is about 2 5%

ACID URINE

To THE EDITOR —*Is there anything better than ammonium chloride to convert alkaline urine to acid urine? What is the dosage of acid sodium phosphate to convert alkaline urine to acid urine?* *Joseph Halton M D Sarasota Fla*

ANSWER —Gram for gram no neutral agent yields more acid in the body than ammonium chloride, since all the ammonium is converted to urea If the kidney is capable of forming ammonium, some of this will reappear as ammonium salts in an acid urine, but the urea normally formed by the body provides most of the ammonium excreted in the urine Chloride forms no urinary precipitate, while phosphates may do so Phosphates also are retained by the kidney in uremia, while chloride is freely excreted One gram of ammonium chloride has as much effect on urinary acidity as 2 5 Gm of acid sodium phosphate The maximal dose of acid phosphate is 4 Gm , 2 Gm three times a day is considered to be adequate to yield acid urine if the diet is not rich in fruit and vegetables A meat diet leads to an acid urine but, if urea-splitting bacteria are in the renal pelves and bladder, the maximal tolerable doses of ammonium chloride or phosphate may fail to neutralize the urine The dosage of acidifying agents necessary to produce acid urine is dependent on diet and on the type of bacilluria

PRISCOLINE® AND CEREBRAL SYNCOPE

To THE EDITOR —*What is the present status of the use of priscoline® (2 benzyl 2 imidazoline hydrochloride) early in cerebral syncope with complete hemiplegia in the presence of relatively clear sensorium and established hemorrhagic cerebrospinal fluid? Blood pressure 180/130 presents no appreciable drop with the use of this sympathicolytic drug A patient 52 has hypertensive heart disease with minimal electrocardiograph deviations*

C D J Generales M D New York

ANSWER —There is no reliable information on the effect of priscoline® on the cerebral circulation and in any event it would seem contraindicated in the presence of intracranial hemorrhage

VITAMIN E AND FERTILITY

To THE EDITOR —*What is the effect of tocophorex® (concentrated vitamin E) on the fertility in male and female? Is it harmful?* *M D New York*

ANSWER —Experiments on rats and other laboratory animals have demonstrated that a lack of vitamin E (alpha tocopherol) may impair fertility in two ways First, it causes degeneration of the seminiferous tubules Second in established pregnancies it leads to death and resorption of the embryos Since this vitamin is widely distributed in common foodstuffs the ordinary mixed human diet is almost certain to include adequate amounts In theory, therefore supplementary administration would have no value In practice alpha tocopherol, natural and synthetic, has been extensively tried in the management of sterility and habitual abortion Early reports were encouraging but larger clinical experience has raised considerable doubt about the utility of this treatment At best vitamin E appears to be generally supportive rather than specifically corrective There can be no harm in one s employing it as an accessory therapeutic item

BLEEDING FROM THE NIPPLES

To THE EDITOR —*A 26 year old secundigravida nullipara now 6½ months pregnant began to have bloody discharge from both nipples two weeks ago She has had sore breasts before menses for 10 years Fluid in which red blood cells can be seen microscopically can be expressed by gentle pressure on the breasts from at least four duct openings on one breast and five on the other There are no palpable masses Three Papanicolaou stains of both breasts at two day intervals were interpreted as negative (atypical II possible adenoma?) Does bleeding from the nipples ever occur from pregnancy alone? Does the statistical possibility of cancer increase or decrease in the presence of bleeding from multiple ducts? In this case is it preferable to delay therapy until pregnancy has terminated and watch for continued bleeding?*

Edward K Strong M D San Francisco

ANSWER —This patient probably has diffuse intraductal papillomatosis Bleeding from the nipples does not occur from pregnancy alone The statistical possibility of cancer decreases when bleeding is from multiple ducts Bilateral simple mastectomy is unjustified The patient should be carefully watched If at any time a distended duct or a palpable mass becomes evident it should be excised If the bleeding continues, it can often be controlled by x ray therapy (1,500 r to each breast in divided doses)

LUPUS ERYTHEMATOSUS

To THE EDITOR —*Will L E cells that have been described in cases of lupus erythematosus disappear during pituitary adrenocorticotropic hormone therapy?*

Ronald Germain M D Albany N Y

ANSWER —Brunsting, Slocumb and Didcoct (*Arch Dermat & Syph* 63 29 [Jan] 1951) in a report of seven cases stated A signal disappointment was the failure of Cortisone [and presumably pituitary adrenocorticotropic hormone (ACTH)] to abolish the Hargraves phenomenon in the bone marrow Occasionally so-called lupus erythematosus cells were not clear-cut but always the specimens revealed signs of amorphous material as indications of a positive reaction " The plasma test of Haserick was not applied in Brunsting s cases Haserick, however reported (*A M A Arch Dermat & Syph* 63 534 [April] 1951) the case of a woman with acute disseminated lupus erythematosus in whom the results of the lupus erythematosus test were negative on three occasions The patient responded dramatically to treatment with cortisone and the results of tests became positive one week later and have been positive ever since

FIBROUS CAVERNOSITIS

To THE EDITOR —*Please give me information on the etiology and treatment of plastic penitis*

J B Evision M D Huntington Ind

ANSWER —The penile lesion referred to in all probability is that which usually is termed fibrous cavernositis (Peyronie s disease) This lesion is generally regarded as a result of chronic inflammation in the sheaths or intracavernous septums of the corpora cavernosa One or more fibrous plaques may result which are readily palpable in the shaft of the penis as firm nodules of variable size and form The lesion often causes penile deformity when in erection and may be the cause of pain The fibrous plaques usually can be distinguished from gumma or malignant lesions by their intense hardness and by the absence of clinical data which usually accompany syphilis and penile neoplasm As a rule the fibrous process gradually becomes circumscribed and the local symptoms subside Good results have been obtained in some cases by surface applications of radium A mixture of tocopherol acetates (tofaxin®) in a dosage of 50 mg three times daily has been advocated recently and has had variable results This drug consists largely of synthetic vitamin E and theoretically is supposed to favor the absorption of scar tissue Surgical excision has been employed but the results obtained often have been unsatisfactory

RESIDUALS OF CEREBRAL EMBOLISM

To the Editor —*A professional man 47 had a complete right hemiplegia 11 months ago following digitalization for paroxysmal auricular tachycardia Cerebral embolism was diagnosed Complete return of function of the extremity occurred immediately following procaine injections of the left cervical sympathetic nerves At present the only residual evidence of the hemiplegia is weakness of the extensors and adductors of the fingers and thumb with slight numbness of the skin of the distal phalanges Will exercise of these muscles eventually improve their function? What medications will be of value? At the time of the hemiplegia aphasia occurred There has been improvement in speech in the last few months but the patient still has difficulty in pronouncing many words and in writing, although the facial pharyngeal, and lingual muscles appear normal Will speech exercises further improve his speech?*

M D Michigan

Answer —Continued use, manipulation, and exercise of the affected thumb and fingers is the only form of treatment that is likely to prove beneficial, and it may be of great assistance It should be done many times every day The exact method followed matters little, as long as all joints of the affected parts are carried through a full range of all possible movement at frequent intervals The same is true of exercise in improvement of the patient s speech Again, it is not the particular form of exercise but its completeness and very frequent use every day that are important in the treatment No medicine is likely to prove beneficial

BANTHINE®

To the Editor —*What is the chemical formula for banthine®? Are there any reports of this preparation s having caused pigmentation?*

O S Philpott M D, Denver

Answer —The descriptive formula of banthine® is beta diethylaminoethyl xanthene 9-carboxylate methobromide There are no known or available reports that this preparation may have caused pigmentation

OINTMENT CONTAINING ERYTHROCYTES

To the Editor —*Please send me the formula for and directions for using an ointment containing red blood corpuscles in the treatment of indolent ulcers?*

Henry D Coles M D Chicago

Answer —Many preparations of which the basic component is human red blood cells have been described As good as any is that used by Murray and Shaar (Red Blood Cell Paste in Treatment of Ulcers and Chronically Infected Wounds, J A M A **125** 779 [July 15] 1944) They prepare a red cell paste in the following manner Seventy-five cubic centimeters of 1 1,000 hexylresorcinol solution is placed in a sterile pyrex beaker, 2 5 gm of powdered tragacanth is dusted on the surface, a sterile covering is applied, and it is allowed to stand several hours until a gelatinous mass forms This is then heated in a water bath for 20 min at 100 C After cooling, it is removed from the beaker with a sterile spatula and 30 gm is added to a sterile bottle containing 250 cc of packed red blood cells This is thoroughly mixed and stored at 2 to 5 C After cleansing the wound with isotonic saline and dry gauze, a thin film of the red cell paste is applied with a sterile cotton applicator, allowed to dry, and then covered with a sterile dry dressing The wound is dressed once or twice daily depending on the condition and progress

TETANUS ANTITOXIN AND BURNS

To the Editor —*What is the indication for or against tetanus antitoxin or tetanus toxoid in industrial burn cases for electrical chemical and ordinary burns?*

J M Hesser M.D Benson Ariz

Answer —Currently in much of industry neither tetanus antitoxin nor toxoid is administered after any injury except in special situations This practice applies to burns as well as to other injuries The exceptions derive oftener from the place of the workman's residence rather than the type of work itself When workmen reside on farms or are otherwise around animals antitetanic agents may be administered Workmen such as plumbers, sewer mechanics, and animal handlers customarily are given tetanus antitoxin or toxoid The reason behind this growing tendency against use of these agents is, on the one hand, the low incidence of tetanus in industry, and, on the other, the relatively high frequency of untoward results from the antitoxin in itself In any instance, toxoid would be employed only as a booster injection following known previous administration While these statements are applicable to all industrial injuries, the tendency to make use of tetanus antitoxin or tetanus toxoid is even less in the instance of burns of any nature

FRUIT JUICES AND ATOMIC BURNS

To the Editor —*In the issue of June 2 1951 page 508 there was a question posed with reference to the potassium intake and the treatment of burns Your answer was not entirely satisfactory from all points of view In the early stages of extensive burns the serum potassium concentration may be sufficiently elevated It is unwise, and may even be dangerous to give patients additional potassium at that time When there is any interference with renal function because of diseases of the kidney or secondary to shock syndrome administration of potassium is definitely contraindicated Orange juice contains approximately 200 mg of potassium per 100 cc Grapefruit juice contains approximately 150 mg of potassium in each 100 cc While small amounts could obviously be tolerated by most persons, the excessive uses of these fruit juices, by the allowance of a pitcherful at the bedside leads to the consumption of extraordinarily large amounts of potassium Thus there is the equivalent of 30 milliequivalents in the average quart size pitcher Attention should be drawn to this factor in the treatment of extensive burns of any type, and any evidence of interference with renal function should call for a definite review of the dietary constituents*

Herbert Pollack M D
70 East 77th St New York 21

To the Editor —*The answer to the question concerning contraindications to the use of orange and grapefruit juices in the treatment of burns atomic or otherwise because of the high potassium content of these juices was correct However for completeness an addition should be made to the answer referring the questioner to the paper by Rosenthal and Tabor (Electrolyte Changes and Chemotherapy in Experimental Burn and Traumatic Shock and Hemorrhage Arch Surg* **51** *244 [Nov - Dec] 1945) They stated Fruit juices, because of their high potassium content, are definitely harmful in experimental shock An experiment in tourniquet shock demonstrated that 5 per cent body weight of orange juice by mouth was rapidly lethal*

School of Medicine
Seattle 5

SEVERE DRYNESS OF MOUTH

To the Editor —*In the discussion of the causes and treatment of Severe Dryness of the Mouth in Queries and Minor Notes June 30 1951, no mention is made of the patient s blood count In the presence of hypochromic anemia mouth dryness and dysphagia may be part of the Plummer Vinson syndrome A careful review of such factors as chronic blood loss or destruction dietary iron deficiency and gastrointestinal inadequacy particularly achlorhydria may reveal both the etiologic and therapeutic factors It should also be pointed out that dryness of the mouth is not infrequently an isolated manifestation of deficiency of one or more components of the vitamin B complex The presence of macrocytosis with normochromia or hypochromia would make this even more likely The diagnostic and therapeutic suggestions made above would apply here also*

STATUS OF LIVING DIABETICS WITH ONSET UNDER FORTY YEARS OF AGE

Elliott P Joslin, M D , Boston

Diabetics are living longer than ever before So many of them after years of the disease present distressing complications[1] that this article has been written to show that the condition of some of our patients in the younger group after a quarter century of the disease warrants optimism

These 760 patients with diabetes of 25 years' or more duration fall into four groups (1) Quarter-Century Victory-Medal diabetics, numbering 23, (2) those with onset in childhood who have survived more than 30 yr , numbering 40, (3) those with onset in childhood who have had the disease between 25 and 30 yr , numbering 181, (4) those whose onset was between the ages of 15 and 40 and who have survived 25 yr or more, numbering 516

QUARTER-CENTURY VICTORY-MEDAL DIABETICS

To date[2] no account has been given of the 23 Quarter-Century Victory-Medal patients Undoubtedly there are many others unrecorded, and I suspect the number will multiply rapidly Thus, a few weeks ago in the Acta Medica Scandinavica in the Odin Festschrift, Martensson[3] mentioned 10 patients free from trouble with the eyes after 25 yr of diabetes, but so far as I am aware no other similar statement has appeared in the literature To find one is a great encouragement The Quarter-Century Victory Medal is awarded by the Advisory Committee of the Diabetic Fund of the Boston Safe Deposit and Trust Company to those who fulfil the following criteria These criteria are simple (1) proof of diabetes of 25 years' duration, (2) a sound body as shown by routine physical examination, with the urine free from albumin, (3) eyes without diabetic complications, such as hemorrhages, exudates, and cataracts, and (4) arteries free from calcification as disclosed by x-rays of the chest, abdominal aorta (lateral view), pelvic arteries, and those of the lower legs between the ankle and knee

Detection of these cases is not so formidable an undertaking as many think It is an easy matter to verify the duration of the diabetes, a simple physical examination of the body (including determination of the blood pressure) with a test for albumin in the urine will narrow the number of candidates This leaves the examination of the eyes to be done, and only if they are perfect will x-ray studies be needful The cases are so rare that specialists often are happy to do these latter examinations without charge

The first announcement to give Quarter-Century Victory Medals to diabetics was made in 1947 It was felt that the histories and original treatment of these patients would disclose the cause for their unusually good condition and a hint for methods of treatment to be employed with new patients

Survival Not Accidental —Chance coincidence by no means accounts for the survival of these healthy quarter-century diabetic veterans The more closely their histories are studied, the more definitely do we get indications why they have lived long and remained in excellent physical condition thus far These 23 patients — and I think it important to add that only nine were our own—lived in unusually favorable homes and under comfortable social circumstances, although I know definitely of but one with sufficient funds to have had the advantage of a private nurse for years Not one of the patients belonged to the underprivileged class Three were from physician's families or had relatives who were physicians, and three later became physicians themselves The physicians who treated them were unusual men, most—but not all—of whom were nationally known as pre-eminent in diabetes Furthermore, as a rule, there had been continuity of care —no medical shopping, no wandering from clinic to clinic

Sex In general occurrence of diabetes is about equally frequent in males and females until the age of 25, but in the Quarter-Century Victory-Medal group females predominated (14 out of 23) I doubt if this is accidental I think the reason there are more females than males in this Quarter-Century Victory-Medal list is the more faithful attention paid to treatment by girls and young women than by boys and young men You can

say to a girl, "Do you want a baby? Have you heard that until 1883 Bouchardat had never seen a pregnant diabetic woman, that until 1937 Dr Priscilla White found that only 56% of our pregnant diabetic women had living children, but that since that date 93% have had living children?" Consequently, when my colleagues and I have a diabetic girl we expose her to the pregnant patients awaiting confinement in the hospital and let her see for herself how cheerful and how immune they are to injections of insulin and hormones and to ingestion orally of iron and vitamins and dozens of ammonium chloride pills for the control of edema, all because of the hope set before them that by so doing they will have healthy living children The diabetes of these pregnant patients is kept well controlled, and the inference is so plain to the diabetic girl that if a pregnant patient can control her diabetes, it surely is possible for a patient who is not pregnant to do so As for the boys, there is no such appeal We do ask "Do you want a job? Do you expect to ask us for a recommendation? Do you think a diabetic who fails to control his diabetes should marry your sister?" Be that as it may, a job to a boy is nothing compared with the lure of a baby to a girl

Heredity In several of Naunyn's originally reported favorable cases, there was a familial history of diabetes For several years when seeing a new patient I was cheered to learn there was a relative with diabetes Later it turned out that the incidence of inherited diabetes was proportional to the period of observation, the group composed of children at onset showing 20% incidence while the group composed of those with diabetes of 20 years' duration showed an incidence of 40% In the 23 Victory-Medal cases, inherited diabetes is present in 13 out of 21 (two unknown), or 62%, which is about as high an incidence as in any group of ours, except among the identical twin group Personally, I think this high incidence of inherited diabetes depends on two circumstances—the long periods of observation and the higher social status of the patients Such a high incidence of hereditary diabetes makes me suspect that a familial history of diabetes would be found for all diabetics if one only knew their ancestry More and more this high incidence points to the universality of the distribution of Naunyn's diabetic tendency

Age The age at onset ranged from 1⅘ yr to 32 yr, but only one was over 23 The earliest year of onset was 1916, no other case occurred until 1919, another in 1920, and five in 1921 The longest duration of a diabetic thus far has been 34 yr At present the youngest diabetic is 27 and the oldest 61 Comparable to the latter is a near-medal diabetic, now 63, whom we all considered in perfect condition, but an ophthalmologist found a single small hemorrhage in one eye Of the 23 Victory-Medal diabetics, 22 live in various parts of the United States and one in Switzerland

Marriage and Offspring These diabetics marry Thus, 17 are married—one later became divorced The six remaining single consist of one man and five women Eleven of the 17 marriages have resulted in 28 living children, all of whom are healthy Obviously, so far as this group is concerned, descendants will be quite limited, and the magnitude of danger from transmission of hereditary diabetes will be small

Program of Treatment For 21 of the 23 medal diabetics this was almost identical The urine was made sugar free by diet or at times even by fasting two days a week, the carbohydrate allowance was restricted for the first three years and often longer to 50 or 75 gm daily, the protein allowance was moderate, and the fat allowance (after freedom from glycosuria) abundant The patient's weight was sacrificed to maintain a normal blood sugar and a sugar-free urine Tests were performed daily, often several times The diet was weighed and was low in carbohydrate and calories, and the patients today look back upon it realizing how unhappy they were and the relief they experienced when insulin was available, although even then for the next few years the diet remained low

In the last 15 yr the diet of all these patients has been liberalized Although the food is not weighed, all agree they know food values, and, except in a few instances in which there is a boasting spirit of exceeding dietary bounds or negligence, it is absolutely plain that the carbohydrate intake is restricted and is more often less than over 200 gm daily All shun excess weight, and even the patient claiming the greatest dietary freedom acknowledges in the same breath that insulin is administered according to the urine tests, frequently made thrice daily

TABLE 1 —*Age at Onset and Present Age of Twenty Three Victory Medal Diabetics*

Age at Onset Yr	No of Diabetics	Present Age Yr			
		25-34	35-44	45-54	55-64
Under 5	2	2			
5-9	2		2		
10 14	5		5		
15-19	10		8	2	
20-24	3			2	1
30-34	1				1
Total	23	2	15	4	2

Facts regarding the medal diabetics are summarized in Table 2 Unfortunately, some of these data are indefinite because either the patients were so young at onset or their physicians have died Although only four of these patients ever went into coma, it is clearly evident from the histories that all fell into the severe diabetes group, and, in fact, of the 20 my colleagues and I have classed as having severe diabetes, the average insulin dosage now for 18 is 50 units

So too about diet There is no question about its Spartan character at the onset and for two or three years thereafter for at least 17 of the 23 diabetics The interval between onset and the beginning of insulin therapy was more than two years for six patients This does not necessarily mean that they had mild diabetes at onset because several of these patients were under the strictest dietetic control, this also applies to two of the three patients in whom the interval between onset and the beginning of insulin therapy was over four years

All of these 23 patients are taking insulin, but I am in doubt about the number of units taken by three For the remaining 20, the 24-hr quantity of insulin ranges from 12 to 100 units Two patients take between 20 and 30 units, three between 30 and 40, eight between 40 and 50, one between 50 and 60, two between 60 and 80, and four between 80 and 100 in 24 hr I think the three practicing physicians are those who take the most insulin

Medal Diabetics Are Symptomless—They are free from complications, they have no complaints They do not even have neuritis I just hope they will not forget they have diabetes and am thankful they must be pricked each day as a reminder they are vulnerable There is always more worry over the patient who is allowed to give up insulin than over the one who takes it The soul of Frederick M Allen, who in and out of season has preached that diabetes is not progressive, should be cheered He did so much for me and my patients in the dark preinsulin period that it is a great satisfaction to lay these medal cases at his feet as a tribute to his prophetic insight

Details of a few of the individual medal cases are given below

REPORT OF CASES

TABLE 2—*Data on Victory Medal Diabetics*

Year of onset	1919-1925	
Age at onset yr	1 4/5-32	
Sex—Females	14	
Males	9	
No with inherited diabetes	18	
Degree of diabetes—Severe	20	
Mild	3	
No on rigorous diet at onset usually including fasting	17	
Interval between onset and beginning of insulin therapy		
Within 1 week	4	23
1-3 mo	4	
4-6 mo	3	
1 yr	3	
2 yr	3	
4 yr	2	
5 yr	1	
6 yr	2	
Unknown	1	
Present insulin dose units	12-100 (48 average of 21 patients)	
Marital status—Married	17	
Single	5	
Divorced	1	
No of offspring	28	
No actively working at home or in business	22	

CASE 1—It would be relatively easy to explain why a diabetic could be a Quarter Century Victory-Medal case if all the 23 cases were of similar pattern to the first in the series This patient's diabetes began in April, 1920, at the age of 14 3/5, it was diagnosed in July of that year when a blood sugar of 333 mg was revealed The patient was made sugar free at St Luke's Hospital, New York, and remained so except for six occasions prior to coming to us in November 1921, when the urine was sugar free and the blood sugar two hours after ingestion of food 170 mg His daily diet was 50 gm of carbohydrate, 90 gm of protein, and 75 gm of fat, but later even with insulin therapy the daily diet was only 56 gm of carbohydrate, 63 gm of protein, and 150 gm of fat At the end of 1924 the carbohydrate allowance was 79 gm, the protein 62 gm, and the fat 140 gm The blood sugar was 130 mg after fasting, 120 mg at noon, and 180 mg later in the day From 1925 to 1926 there were no material changes in the diet, the daily dose of insulin was 46 units In 1927 the daily carbohydrate allowance was 95 gm. In 1930 the daily diet allowance was 115 gm of carbohydrate, 75 gm of protein, and 140 gm of fat. As late as 1937 the daily carbohydrate allowance was only 125 gm the protein 90 gm., and the fat 120 gm The patient weighed 158 lb (71 7 kg) and took insulin three times a day in doses of 25, 7, and 25 units respectively In 1940 the daily carbohydrate allowance was 140 gm, and at present the daily diet allowance is approximately 180 gm of carbohydrate, 100 gm of protein and 115 gm of fat. The patient now weighs 158 lb

This patient for the first seven years had perhaps our best trained diabetes nurse never was known to break diet, and lived actively On weekends he flew his own airplane alone with his nurse from New Jersey to Cape Cod He wandered over the world and was perhaps our first patient deliberately to reduce his insulin intake in anticipation of exercise, such as playing tennis in the Bois de Boulogne in Paris Later this patient was again wonderfully fortunate in marrying a young woman who spent months in learning how to care for him Since this time he has been most active in a large business, in 1935 he told me he had only missed five and a half days from work in many years He has three healthy children This man is 6 ft 2½ in (189 cm) tall and weighs 154+ lb (69.9 kg) dressed He was in such abounding health that he received unanimous applause in 1947 at a meeting of the Association of Life Insurance Medical Directors of the United States and Canada. In 1946 in a railroad accident in which many were injured, he suffered fractures of eight ribs, the scapula, and the radius, but his surgeon at Roosevelt Hospital at the end of a month said his recovery was as rapid as that of a nondiabetic This man had not only everything that money could buy to protect him but also a wonderful family friends, and his own character and zeal to make life successful

CASE 2—A somewhat similar case is that of a conscientious girl whose age at onset in March, 1922, was 14 1/10 yr and whose devoted, highly educated, and meticulous parents helped her supervise her diabetes for 27 yr until her marriage She was seen more frequently by us than any of our other medal diabetics, and the control of the diabetes is shown by her blood sugar values, which ranged close to reaction levels and only on the rarest occasions rose above 230 mg in over 20 yr The original diet was a daily allowance of 95 to 118 gm of carbohydrate, 70 gm of protein, and 106 to 150 gm of fat Her daily insulin dose is now 37 units

CASE 3—In this patient diabetes developed in 1921 when the patient was nine years old A daily diet of 54 gm of carbohydrate, 66 gm of protein, and 42 gm of fat was prescribed The patient was maintained on approximately this diet for several years The insulin dose at present is 36 to 44 units daily

CASE 4—Illustrations of the strenuousness of the diet are furnished by this case Onset of diabetes occurred in January, 1923, when the patient was 1 4/5 yr Even with the use of insulin in 1926, the patient, while weighing 39 lb (17 7 kg), ate only 45 gm of carbohydrate, 46 gm of protein, and 90 gm of fat daily In 1949 the daily insulin dosage was 30 units of regular insulin plus 10 units of globin in the morning and 20 units of regular insulin plus 20 units of globin in the evening

CASE 10—This patient's age at onset in 1924 was 9 4/5 yr His diet was more than strict, he ate washed bran, lean meat, branwafers, and 'tons of vegetables" He grew little and had insulin reactions while on the very low diet Urine tests were made two to three times daily, and in the early years every bit of food was weighed on a gram scale His present insulin dose is 88 to 93 units daily Upon the basis of his being a Victory-Medal diabetic, I successfully pleaded with the government to allow him to retain a Federal position

CASE 11—This patient's age at onset in 1921 was 32 She evidently had a mild case of diabetes, and her diet was not as rigid as those heretofore described She is an example of the many diabetics who by faithful adherence to treatment should easily earn a Victory Medal Her daily insulin dose is now 20 units

CASE 12—This patient's age at onset in 1923 was 15 3/10 yr She was on a most rigid diet for three years At the end of three years her daily carbohydrate allowance had been raised to between 60 and 75 gm The patient cannot remember eating any portion of food which weighed over 3 oz. (90 gm)

CASE 13—This patient's age at onset in 1923 was 15 yr A very strenuous diet was prescribed at the start He was the first person in New Mexico to use insulin His insulin dose at present is 72± units daily

CASE 17—Diabetes developed in this patient in 1923, when she was 18 A fairly strict diet was prescribed, the daily carbohydrate allowance being 50 gm, the protein 70 gm, and the fat 150 gm for many years except when her weight went up and the fat allowance was restricted to 50 gm. daily The patient took her diabetic life most seriously and was much disturbed if sugar ever appeared in her urine She made every effort to keep her urine sugar free Her present insulin dose is 48 units daily

DIABETICS WITH DIABETES OF THIRTY YEARS' DURATION WITH ONSET IN CHILDHOOD

Corroborative testimony that diabetics are living long and—most of them—useful lives is afforded by 40 of our patients with diabetes of 30 to 35 years' duration whose onset was in childhood Only one of them, so far as my colleagues and I are aware, is a Victory-Medal patient, but 33 are working steadily Of the remaining seven, one is temporarily out of work, one is a manic depressive, two are incapacitated, and details about three are wanting Of this group is a man whose age at onset in July, 1920, was 14⅘ yr He is at present head of the Parent-Teachers' Association, the Boy Scouts, and President of the Crippled Children Scouts in his locality Another patient was the only child to have survived coma before the discovery of insulin, and another was the first child to have received insulin at our own hands

Twenty-three of the 40 patients are men and 17 are women The incidence of hereditary diabetes is again prominent in this group—62% Thirty-one of the 40 have married, resulting thus far in 41 children in 21 families, of whom nine are in Dr Priscilla White's pregnancy series Of all our women, only two have had as many as four living children, and the number who have borne living children after 25 yr of diabetes can be counted on the fingers of one hand My colleagues and I know of only two divorcees in this group, one man and one woman, although the man subsequently remarried

Calcification of the arteries as shown by x-ray examinations, from a slight trace to a 4 + reading for 22 patients (or 63%), was found in the 35 in whom this complication was sought. The eyes of 30 have been examined by accredited ophthalmologists Nineteen showed arteriosclerosis of the vessels of the retina, 17 were found to have retinal hemorrhages In 13 of the latter, exudates were also found, and five have retinitis proliferans Only one patient, however, can be said to be incapacitated because of the eyes None is blind In one patient with retinitis proliferans coronary cataracts also developed Of the 10 patients whose eyes were not examined, one is reported by his local doctor as "having early retinitis" One has written that he has a "hemorrhage in the right eye," and one is taking rutin "because of trouble with his eyes," which suggests that of the 40 patients some degree of diabetic involvement of the eyes has developed in a probable 33 (or 82%) I would emphasize that 18% may have good eyes, just as my colleagues and I found this to hold for the 23 medal diabetics Even if there was only one with eyes intact, I would be encouraged There must always be a beginning in any series

High blood pressure, ranging from minimal readings of 145/80 to 210/110, was found in 15 (37%) of the entire group, and 10 patients (25%) have shown varying degrees of albuminuria from 50 to 1,000 mg per 100 cc , but I am happy to add that of the 13 patients tested within the past year, five were still free from any trace of albumin in the urine Up to this year tuberculosis had developed in none of the 40 patients This month x-rays of another patient have shown a questionable shadow in one lung, but as yet there has been no definite diagnosis of tuberculosis Epilepsy was diagnosed in but one instance

The rigidity of treatment in the early years is illustrated by a girl who weighed 46 lb (20 9 kg) in 1923, when she was 14⅘ yr Despite this undernutrition, by 1947 her weight was 142 lb (64 4 kg), and she writes that her son, born years after onset of her diabetes, weighs 135 lb (61 2 kg) and is 5 ft 7½ in (171 cm) tall

DIABETICS WITH DIABETES OF TWENTY-FIVE YEARS' DURATION WITH ONSET IN CHILDHOOD

This group includes 181 patients who already have had diabetes for 25 to 30 yr Of these, 81 are men and 100 women One hundred and twenty-six are married, of which 53 are men and 73 women Two of the women have married twice and one three times Three we learn have been divorced Eighty of these 181 patients so far have 111 living children, and several are "expecting" Four have adopted children Indeed, we have one diabetic mother who, losing her own child, adopted the illegitimate child of another of our diabetics

Eyes—Various data about the eyes, presence of albumin in the urine, blood pressure, and condition of the arteries are given below These data were not synchronously obtained, but they give a hint as to the general picture Of the 114 examined by ophthalmologists, arteriosclerosis of the retinal vessels was found in 56 (49%) and retinal hemorrhages in 57 (50%), 23 of the latter also showed exudates Seventeen patients have retinitis proliferans, and in six cataracts have developed Four patients are almost or entirely blind, three are blind in one eye, one is reported to have extensive detachment of the retina, and one is temporarily unable to work because of retinal hemorrhages

Albuminuria has been recognized in values ranging from 50 to 1,020 mg per 100 cc in 32 (18%) of the 181 patients However, many have not been examined recently This is in marked contrast to the figure of 51%, which represents the proportion of deaths from kidney trouble among our 135 deaths among juveniles between 1944 and January, 1950 The blood pressure of 61 (34%) has shown readings of 145/80 or above Arteriosclerosis has been discovered in 71 (59%) of the 121 patients examined by x-ray

Psychological difficulties of sufficient severity to require treatment, ranging from anxiety neurosis to acute reactive depression necessitating electric-shock therapy, have developed in 11 of the 181 patients In addition, two patients have become psychotic, requiring institutional care One of these even received the Victory Medal One patient is suspected of having petit mal, and one patient reports having been operated upon for epilepsy Pulmonary tuberculosis was found in five patients

Four of the 181 have received the Victory Medal, and several are now being considered as possible future recipients of the honor Five in the group are successful practicing physicians, and one patient is presently employed as head nurse on the delivery floor of a nationally famous hospital

DIABETICS WITH DIABETES OF TWENTY-FIVE YEARS' DURATION WITH ONSET BETWEEN FIFTEEN AND FORTY YEARS

There are 516 of these patients One hundred and eighty-eight had treatment with us before our first patient received insulin, Aug 7, 1922, and another 118 fell into our hands before 1926 The remaining 210 patients received treatment elsewhere before my colleagues and I saw them

Sex—In this group there are 273 men and 243 women

Race—Among all our patients 16 2% are Jewish, and among these 516 quarter-century diabetics the percentage was essentially the same—18%

Heredity—The incidence of hereditary diabetes here as in all long-duration diabetes groups was high, namely, 44%, among the men it was 32% and among the women, 53% (as usual higher) So marked a divergence between the sexes in the incidence of hereditary diabetes I do not remember having encountered before

Marriage—Only 42 of the 273 men and 31 of the 243 women were single Seventy-nine per cent, or 410, were married Eight of the 516 had been divorced

What is the present status of these 516 diabetics whose onset was between the ages of 15 and 40 with 25 yr of diabetes behind them? Information was sought for nine items from the records and letters later received from patients and physicians (1) use of insulin, (2) whether the patient is working or active at home, (3) presence of albumin in the urine, (4) presence of high blood pressure, (5) condition of the eyes, (6) whether amputation of an extremity had been done, (7) manifest presence of arteriosclerosis, (8) presence of cardiac disease, and (9) presence of cerebral involvement Data were missing in many of these categories Consequently, it was decided to report upon only those diabetics for whom we had definite knowledge of at least six of these nine topics Data regarding 63 of the patients seen earliest in the series and 41 seen latest were analyzed

Present Status—It is apparent that practically all of the patients are taking insulin—98 4% and 92 7% of the two groups respectively Approximately 80% are active, although they are far above the age of 40, and their ages now range up to 65 or more Albuminuria was reported in about 20% but a high blood pressure or involvement of the eyes in about 50%, with fully two-thirds of these showing arteriosclerosis Heart disease was seen in slightly more than 25%, but only four patients had histories indicating cerebral involvement Only nine of the 104 whose cases were analyzed had an amputation of an extremity

SUMMARY

Such is the condition of our 25-yr -duration diabetics A few are perfect, and approximately 80% are active The patients in perfect condition are those whose treatment was initiated (with hardly an exception) with strenuous control of the diabetes in their early years, this control being maintained for 10 yr , more or less, to more than the usual extent and even then continued As in Dr Priscilla White's[4] series of children's cases, as in the youthful cases reported by Root, Sinden, and Zanca,[5] and as in the 247 cases recently studied and soon to be published by Root, Wilson, and Marble,[6] so in this series the evidence is overwhelming that strict treatment of diabetes pays and, moreover, that control of the disease is possible I grant that the life of a diabetic child or young adult even today is no flowery bed of ease I acknowledge that tuberculosis, coma, and renal disease are far too frequent in young diabetics, but I think one is justified in saying that in a diabetic arteriosclerosis need not be premature

PNEUMOCOCCIC MENINGITIS IN INFANTS AND CHILDREN

COMBINED THERAPY USING PENICILLIN AND SULFONAMIDE

Rosa Lee Nemir, M D
and
Jacob Israel, M D , New York

The steady advance in therapy in the past decade with the introduction of new chemotherapeutic agents and the antibiotics has dramatically influenced the fatality rate of pneumococcic meningitis It is now a question of not only which agent or combination of agents to use, but also of how each agent can most effectively be applied In the treatment of meningitis, especially, the known irritation and possible danger of intrathecal medication must be weighed against the seeming necessity for its use in a usually fatal disease

Penicillin was first used on the Children's Service at Bellevue Hospital in the treatment of pneumococcic meningitis in May, 1943 The following report will concern itself with patients seen only since this time Fifteen infants and children were treated between May, 1943, and December, 1949

Pneumococcic meningitis was almost universally fatal before penicillin and sulfonamide therapy Rarely did a child survive Of 150 patients from the Harriet Lane Home, Baltimore, as reported by Waring and Smith [1] in 1944, there were no recoveries The disease was almost

Tables 2 and 3 have been omitted owing to lack of space They are included in the reprints

[1] Waring, A J Jr and Smith M. H D Combined Penicillin and Sulfonamide Therapy in the Treatment of Pneumococcic Meningitis J A M A 126 418 (Oct 14) 1944

invariably fatal at the Children's Hospital, Washington, D C, where Ross and Burke[2] described one recovery in 66 patients All of the 157 patients observed by Toomey and Roach[3] succumbed, as did those in our own experience prior to 1943

The use of sulfonamides changed the fatal outlook slightly, as illustrated in the series of Waring and Smith[1] with one recovery out of 17 The combined use of antipneumococcus serum and sulfonamide further improved the prognosis Ross and Burke[2] reported 10 recoveries in 38 cases, and Sweet and his associates[4] described three survivals out of a group of 40 patients, one-half of whom received both sulfonamide and type-specific antiserum Combining the results reported from other institutions with those in Children's Hospital, Ross and Burke found that the fatality rate using both agents was still high, ranging from 58 to 70% Dowling[5] had four recoveries in 72 cases

The addition of penicillin to the therapy of pneumococcic meningitis introduced the new era in the prognosis of this disease Using penicillin alone, Sweet and co-workers[4] reported seven recoveries in 16 patients

The purpose of this study is to give the excellent results using the combined therapy, sulfonamides and penicillin, in 15 consecutive patients Fourteen recovered from the acute infection, and only one of these had residua The 15th patient was moribund on admission and died 27 hr later

MATERIAL

All patients with pneumococcic meningitis seen on the Children's Medical Service, Bellevue Hospital, between May, 1943, and December, 1949, are here reported They were treated with penicillin and sulfadiazine as well The ages of the patients ranged from 4 weeks to 11 yr, nine being well under 1 yr of age, and seven were under 6 mo It is significant that recovery without residua was obtained in two babies under 6 weeks of age treated, and in a third, who was a premature baby, weighing 8 lb 12 oz (4 kg) and being 4 mo of age at the time of infection Thirteen of the 15 cases were observed from October through May, coinciding in seasonal incidence with the period cited by Ross and Burke[2] in their more extensive series of 64 cases

CLINICAL FINDINGS

Twelve of the 15 patients were seen early in the course of the disease, from six hours to two days after onset One of these was admitted with a febrile illness of only one day and evidence of meningitis developed 48 hr after admission to the hospital On the other hand, one infant, who was first seen late in the disease, had a febrile illness of two to three weeks, with clinical signs of meningitis for at least five days previous to admission Hydrocephalus in this patient developed and he died nine months after the infection with meningitis

Although most of these patients were seen early, the diagnosis of meningitis usually was made readily on admission Of the 15 patients, 11 had obvious signs leading to the immediate diagnosis of meningitis A stiff neck had been found in five of these before admission to the hospital and three others had convulsions There were four, however, in whom the diagnosis was elusive Two patients were first admitted to other services, one to surgery and one to otolaryngology, because of swelling below the left ear following a long-lasting respiratory disease In both instances the diagnosis of pneumococcic meningitis was established 24 hr later

The difficulty of diagnosing pneumococcic meningitis in young infants must be emphasized, and the consequent later diagnoses may in part account for the higher fatality rate in this age group Neurological signs may be absent early in the disease Cases 3 and 14 were particularly instructive in this respect Both infants were brought to the hospital because of convulsions and fever and hence were examined carefully for signs of meningitis In Case 3 neurological signs were not found until eight hours after admission, even though the spinal fluid on admission was turbid and clearly indicated a meningeal infection In Case 14 the problem was even more difficult Repeated neurological examinations were negative, and since the spinal fluid was clear and its chemistry was normal, a diagnosis of meningitis could not be made until a positive spinal fluid culture for Pneumococcus Type VI was obtained 20 hr later At this time a second spinal tap revealed a purulent fluid with marked cellular reaction Here, then, was an infant with extensive bacteremia and bacterial invasion of the spinal fluid producing repeated convulsions without associated neurological signs

One month later a newborn infant, Case 15, was seen with a somewhat similar history of convulsions and fever, but of longer duration Again, a neurological examination was negative and the fontanel was flat, but the spinal fluid was cloudy and contained some cellular reaction A smear of this fluid showed numerous gram-positive diplococci Here, again, there was obviously extensive bacterial invasion of the spinal fluid, probably early, which would not have been diagnosed without the aid of the spinal fluid studies

Physical examination alone is often deceptive and cannot be relied on for a diagnosis of pneumococcic meningitis in young infants The commonest finding in infants under a year was a bulging fontanel, which was discovered in six of the nine infants in this series

Meningitis developed under observation in Case 8, in whom the first study of the cerebrospinal fluid indicated a serous meningitis, i e, negative culture and a mild lymphocytic cellular reaction The second cerebrospinal fluid specimen, obtained 24 hr later, showed an increased cellular reaction of polymorphonuclear cells and a positive culture for Pneumococcus Type XX In this instance a slightly stiff neck without any other neurological findings was observed on first examination

The neurological examination alone was adequate to diagnose meningitis in 10 of the 15 patients either because of a stiff neck, Brudzinski sign, ankle clonus, or spasticity

In all 15 cases pneumococci were grown from the spinal fluid and typed Direct smears from the spinal fluid are of real value in guiding the immediate therapy and should be done always Attention to morphology as well as reactions to gram-staining will help prevent the occasional error in staining technique In Case 15 in this series a smear of the spinal fluid showed abundant gram-positive organisms far out of proportion to that expected with the low cellular reaction in the spinal fluid

Eleven patients had positive blood cultures In one of these the first blood culture taken together with the simultaneous spinal fluid was sterile, however, for the next three successive days pneumococci were grown from the blood stream In the remaining four patients the blood cultures remained sterile

Nose and throat cultures were taken on 12 patients, and, from 10 of these, pneumococci were cultured which, when typed, were found to be the same type as that in the spinal fluid

In all patients an effort was made to locate the focus for the pneumococcic infection X-rays of the chest were taken on all patients, and, when indicated, mastoid and sinus x-rays as well There were 10 patients in whom a focus was found either by physical examination or by study of x-rays In two of these, purulent otitis media alone was found, in another two there was x-ray evidence of infection in the maxillary sinuses and in the mastoids —one of the latter patients also had pneumonia Only two infants had pneumonia clinically, one diagnosed by x-ray evidence alone, and clinical signs of bronchopneumonia developing in the second shortly after admission In a third infant, Case 15, early lobular pneumonia, apparently not the focus for the meningitis, was found only at autopsy

THERAPY

As soon as the diagnosis of meningitis was established, all patients were given penicillin intramuscularly and sulfadiazine orally, the latter usually in dosages of 1½ grains (0 10 gm) per pound of body weight. Fourteen of the 15 patients received intrathecal penicillin as well, although three of these had only one such treatment given in the beginning of the disease In two desperately ill patients, specific antipneumococcus serum was also given In one of these, Case 9, heparin was administered intrathecally on three occasions, as suggested by Ross and Burke [2] for the prevention of adhesions that might obstruct the flow of the cerebrospinal fluid between the ventricles and subarachnoid space (In the future streptodornase and streptokinase might be employed for this purpose) Though desperately ill, this patient survived the acute infection, but was left with severe central nervous system damage and died nine months later

Intrathecal therapy with penicillin was used as soon as the diagnosis was confirmed bacteriologically in 14 of the 15 patients and was continued in 10 of these until the fluid was sterile There was considerable variation in the amount and duration of intrathecal penicillin therapy Clinical judgment is important in guiding the therapy, taking into consideration such factors as the age of the patient, duration of illness prior to beginning treatment, and severity of infection In this series the single dose of intrathecal penicillin has varied from 5 to 20,000 units in all except Case 6 Lately, we have usually given 10,000 units to children and 5,000 or less to infants, per day

Equally important with the dosage of penicillin is the number of intrathecal injections both as regards meningeal irritation, sensitivity reactions to the antibiotic, and efficacy of therapy Of the 15 patients in this series, only three were treated intrathecally longer than six days An average of five intrathecal treatments with penicillin was given to 11 patients, five of these had three or less injections The patients described by Hutchins and Davies [6] averaged 11 intrathecal treatments with some patients receiving two to three treatments a day, and those of Ross and Burke [2] averaged six treatments The fatality rate of these two series is higher than that of the present report, being five patients of 14, and three of 19, respectively Appelbaum, Nelson, and Albin [7] more recently suggested three to five injections The fatality rate in their series was 18 2% for 44 patients under 11 yr There are many factors influencing fatality, but it is suggested that more intrathecal treatment did not give a better prognosis

Particularly significant as regards intrathecal therapy is Case 7, a 4-week-old infant whose spinal fluid could only be removed by negative pressure because of the abundance of thick purulent exudate Because of mechanical difficulties no more than two small intrathecal injections of penicillin of 2,000 units each could be given, and yet the patient recovered

RESULTS

Fourteen patients recovered from their pneumococcic infection, in one hydrocephalus developed and he died nine months later Two of the cured patients were 1 mo and 6 weeks of age, respectively, at the time of the infection One infant of 42 days was moribund on admission and died 24 hr later There were nine patients under 1 yr of age

A follow-up study of all patients surviving was made at intervals ranging from six months to five years after the infection All patients were well and manifested no residua attributable to the pneumococcic infection One child, however, had a reading disability, and a second had a severe behavior problem, probably resulting from infantile hydrocephalus which had existed for many years before the pneumococcic meningitis Electroencephalography was not done in these patients

COMMENT

The change in the almost universally fatal prognosis of pneumococcic meningitis with the use of combined therapy, penicillin and a sulfonamide, is most impressive Analysis of the cases from the literature revealed that of 158 children treated with this combined therapy, 128 (81 0%) lived

[6] Hutchins G and Davies, J A V Penicillin Treatment of Pneumococcus Meningitis in Infants J Pediat 27:505 1945

[7] Appelbaum E. Nelson J., and Albin M B The Treatment of Pneumococcic Meningitis with Penicillin, Am J M. Sc 218:260 1949

Of the nine patients in this series under 1 yr of age, all except two were admitted to the hospital within 48 hr of onset of the disease These two were the ones who failed to recover promptly, one dying within 27 hr and hydrocephalus developing in the other who died nine months later

An analysis of the prognosis in our series with regard to age of the patient and duration of the disease prior to treatment was made Clearly, patients seen late in the disease have a poorer prognosis, the two patients who failed to respond were seen after the fourth day of disease and both were under 1 yr of age

A composite study of pneumococcic meningitis as reported in the literature with reference to prognosis and duration of disease at the time of treatment was made The fatality rate of patients treated not later than the first 72 hr (42 cases) is 11 9% Thereafter the chances of recovery decrease in proportion to the length of time of the disease before treatment is begun For all cases studied, 105, the fatality rate was 24 8%, whereas for the 33 treated after the fifth day of disease, 42 4% died

Although in the small series here presented the results were highly satisfactory, the question arises as to whether the same success might be achieved with less strenuous therapy Is intrathecal therapy necessary? One patient in our series demonstrated the possibility of complete recovery without it

The danger of intrathecal therapy with any form of foreign material is well known Three of our patients had convulsions from one to four hours after intrathecal penicillin was given Only one of these had had convulsions previous to intrathecal therapy, but this child continued to have severe convulsions after each intrathecal treatment This irritative effect of antibiotics on the central nervous system has been previously noted Reuling and Cramer[8] report a case of convulsions in an adult patient receiving 500,000 units of penicillin This patient recovered, however, without sequelae Johnson and Walker[9] report one case showing convulsions after a massive treatment, receiving 100,000 units intramuscularly in an infant Other observers[10] also report reactions which are thought to be due to the penicillin itself, either because of impurities or because of excessive dosages of the antibiotic

Appelbaum, Nelson, and Albin[12] indicate reactions such as arachnoiditis, convulsions, and pyrexia in a small group They suggest that cerebral irritation may be in part associated with large doses of the antibiotic intrathecally

Cairns and others[11] found early in their study that with the use of impure preparations for intraventricular injections there were frequent mild reactions, such as patchy erythema of the skin, trunk, and limbs, generalized sweating, intermittent goose flesh, rise in pulse rate, and sometimes vomiting All of these symptoms usually cleared within from 10 to 20 minutes In Cairns series, palsy and dysphagia were also observed after the intraventricular route Waring and Smith[1] report a case of bilateral optic atrophy, and Appelbaum,[12] a case of transverse myelopathy following intrathecal penicillin

The possible harmful effect of intrathecal medication was well understood even before the era of chemotherapy This point has been repeatedly emphasized by Hoyne, who demonstrated that meningococcic meningitis may be even more effectively treated without intra-

thecal medication [13] both as regards more rapid recovery and the development of fewer complications Recently he has indicated that similar favorable results may be obtained in influenzal meningitis [14] Rosenberg and Sylvester [15] have shown that during the period of infection of the meninges, the membranes may become permeable to the antibiotics, even though during health this relation may not hold Such observations should favor the intramuscular mode of therapy and give support to withholding intrathecal therapy in many instances

Many cases of residual spasticity and mental deficiency in the cured cases of meningitis using intrathecal therapy have been reported [16] Some of these residua may be in part attributed to the disease, as it is characterized by a more abundant fibrin exudation than other varieties of acute bacterial meningitis The tendency to adhesive arachnoiditis in pneumococcic meningitis is well known Because of this subarachnoid block and the resulting hydrocephalus, relapse of the infection is not an uncommon sequela

Only one of our patients, Case 6, a premature infant weighing under 9 lb (4 kg) at 4 mo of age, had a relapse This infant had seven intrathecal injections of penicillin, and for three days of this period the patient appeared clinically cured The cultures were negative, the spinal fluid chemistry was normal, and the cell count was below 40 cells Four days after discontinuance of intrathecal therapy, pneumococci were again grown from the spinal fluid, and a fall in spinal fluid sugar and an increase in spinal fluid cells were noted, together with a recurrence of signs and symptoms suggesting meningitis Treatment was reinstituted immediately A focus for the relapse was discovered in the right mastoid Antrotomy on the right was effective in removing the focus, and prompt recovery followed

It would appear from both a study of the cases reported in the literature and the observations of Hoyne [14] that a contributing factor to the severity of the sequelae is the amount of intrathecal therapy in terms of the number of intraspinal injections and total dosage of the antibiotic However, since the severely ill patients receive more intense therapy, conclusions are difficult as regards the amount of therapy Certainly patients seen early in the disease might best be treated with intensive intramuscular penicillin, and perhaps intravenous penicillin as well, together with sulfonamides without intrathecal therapy In support of this argument is the recent report of Dowling, Sweet, and co-workers [17] on 21 patients, children and adults with pneumococcic meningitis, with a recovery of 13 (62%) Eighteen of these 21 patients were treated without intrathecal penicillin, the antibiotic being given in large amounts intramuscularly In these cases the spinal fluid level of penicillin eight hours after intramuscular medication ranged from 08 to 1 25 units per cubic centimeter

A statistical comparison of the fatality rate of patients reported in the literature treated with penicillin by the intramuscular route alone as compared with combined routes, intramuscular and intrathecal, is 31 4% and 20 8%, respectively [18] When corrected for fatalities occurring within the first 24 hr of treatment, there is no significant difference in the two groups The insistence on the necessity for intrathecal penicillin therapy is not warranted by these figures It may be that the severely ill patients are more likely to be treated with intrathecal medication, and thus the group with intramuscular therapy alone may contain more moderately and mildly ill patients It is our opinion that intrathecal therapy is indicated when the factors influencing prognosis are unfavorable

It is generally agreed that the younger the infant, the less favorable the prognosis becomes, and that recovery in newborn infants is unusual In 1945 Hogg and Bradley [19] reported the recovery of one patient with pneumococcic meningitis in the neonatal period treated with sulfadiazine alone They reviewed the literature and found in 28 cases only two other recoveries, described by Ravenel [20] and Uhr,[21] both cases having been treated by repeated spinal drainage only, thus giving a total of three recoveries in the newborn period Ravenel's case of pneumococcic meningitis was diagnosed entirely from the finding on smears of gram-positive organisms in the spinal fluid, the diagnosis was not confirmed by cultures Pneumococci were cultured from the spinal fluid in the case reported by Uhr in 1929 Recovery of a newborn infant with pneumococcic meningitis using penicillin was reported in 1947 by Cohlan and Solomon [22] This 25-day-old infant was treated with penicillin, intrathecally on four occasions, intravenously for four days, and intramuscularly over a long period of time, together with sulfadiazine The infant was cured and had no residua when seen at 20 mo of age Two separate reports in the French literature in 1947 each described newborn infants, 2 days [23] and 7 days [24] of age, who recovered promptly following combined sulfonamide and penicillin therapy, the latter drug given both intrathecally and intramuscularly We are adding a seventh case of recovery from pneumococcic meningitis in the newborn period, an infant who although only 4 weeks of age was cured with only 4,000 units of intrathecal penicillin, the antibiotic being given intramuscularly in large amounts as well A follow-up one year later revealed a normal infant

A final comment concerning the changed picture in pneumococcic meningitis since the introduction of the sulfonamides relates to the pathogenesis of the disease One of us has been interested in the pneumonias of childhood for many years and has observed that the development of pneumococcic meningitis as a late and terminal complication of pneumococcic pneumonia was not uncommon Such a sequence of events has not been observed on this service throughout the period of study here reported Only two of the 15 patients in this series of cases had pneumonia, both instances of which were mild and apparently not the foci for the meningitis

SUMMARY

1 Fifteen patients from 4 weeks to 11 yr of age who had pneumococcic meningitis are reported Fourteen recovered, and one infant who was moribund on admission died 32 hr later

2 In a 10-mo -old infant admitted after five days of illness severe hydrocephalus developed and he died nine months later A follow-up study on 11 patients made from six months to five years after the infection showed no residua attributable to the meningitis

3 One patient recovered without the use of intrathecal medication, and a second had only negligible amounts intrathecally, three others had only one intrathecal injection

4 Recovery of an infant 4 weeks of age is reported, the seventh newborn infant reported in the literature as recovering after pneumococcic meningitis

5 All patients received penicillin intramuscularly, in fairly large amounts, and sulfonamides orally Two patients were given penicillin intravenously, also

6 The disadvantages of intrathecal therapy are discussed

CONCLUSIONS

Pneumococcic meningitis is no longer a highly fatal disease A composite study of all cases in infants and children using sulfonamides and penicillin systemically with or without intrathecal therapy gives a recovery rate of 81 0% Early diagnosis and age of the patient are important prognostic factors

In view of the clinical experiences herein described, as well as experimental evidence, it would appear that intrathecal therapy of pneumococcic meningitis is not always a necessity The dangers of this therapy should be fully appreciated It may be indicated in the treatment of the desperately ill patients and those seen late in the disease Repeated intrathecal injections should be used in selected cases only As a result of our studies, we would suggest that every effort should be made to curtail, if not to abandon, intrathecal medication in the treatment of pneumococcic meningitis

REACTION TO TETRACAINE (PONTOCAINE®) USED AS TOPICAL ANESTHETIC IN BRONCHOSCOPY

STUDY OF 1,000 CASES

Wilson Weisel, M D
and
R Anthony Tella, M D, Wood, Wis

The distinct increase in definitive surgical operations for intrathoracic diseases and lesions during the past two decades has caused an even greater increase in the incidence of diagnostic procedures to confirm or to help rule out the presence of pathologic processes within the chest As the mortality and morbidity following thoracic surgical procedures have decreased and inversely the cures and good results have increased, it has been extremely important and of universal interest that untoward reactions, morbidity, or mortality attendant on diagnostic procedures be reduced to an absolute minimum

One of the most distressing and sometimes fatal [1] complications of endoscopic procedures has been the so-called "anesthetic reaction " In discussions with our colleagues, it has been evident that there has been a decided difference in opinion regarding the incidence and severity of the anesthetic reactions, as well as the anesthetic agent of choice[1] The opinions voiced have varied from the thought that endoscopic work should be a casual office procedure to the view that topical anesthetics should be used only in a hospital where facilities for artificial respiration and intravenous medication are immediately available A review of the literature has revealed a similar diversity of opinion regarding the occurrence of anesthetic reactions and the role of the particular anesthetic agent in the production of these reactions The reactions in general have been inadequately described

This diversity of opinion and an unfortunate previous experience prompted the report of this study Tetracaine (pontocaine®) hydrochloride was chosen as the anesthetic agent first to be studied because it had been proved to be efficient and widely used, although it is one of the

more controversial [2] of the topical anesthetics In order to assess the effect of tetracaine hydrochloride, 1,000 consecutive diagnostic bronchoscopies on adults were studied These procedures were performed on 947 patients from January, 1947 to December, 1949 The material used for the anesthesia was commercially prepared 2% topical tetracaine solution

A number of methods have been utilized to produce anesthesia for endoscopic procedures, and recently a series of articles have described a variety of methods that are in use today [3] Most of these techniques, however, have employed some form of spray or atomization, and because of rather frequent reactions and one death which we noted in a previous series of cases following spray application to the pharynx, this form of anesthetization was not used for this group of patients In addition, it has been our opinion that the amount of absorption of the anesthetic agent was most difficult to judge following the use of spray, atomization, or nebulization

ANESTHETIC PROCEDURE

The anesthetic procedure utilized was as follows Preoperatively the patient receives 50 mg of meperidine (demerol®) hydrochloride one-half hour prior to the administration of the anesthetic, and 2 grains (120 mg) of phenobarbital (luminal®) sodium are given by hypodermic injection three and one hours respectively, prior to endoscopy Ten cubic centimeters of 2% tetracaine solution is then poured into a sterile medicine glass One cubic centimeter of this is aspirated into a 2 cc Luer-Lok syringe through an attached laryngeal cannula Cotton pledgets held in grasping forceps are then dipped into the remaining solution and pressed dry against the side of the medicine glass The pledgets are placed successively between the faucial pillars, in each pyriform sinus, and held in each of the four locations for about one minute Then 1 cc of solution is placed in the trachea in two doses under visual guidance with use of a laryngeal mirror This method has been efficient in production of satisfactory anesthesia in all these cases The definite amount of anesthetic used has been difficult to determine, but by gravimetric measurements it was noted that an average of 1½ to 2 cc of solution was utilized for the anesthesia These measurements have been admittedly inaccurate because of probable absorption of saliva on the pledgets, as well as the expectoration of some of the anesthetic injected into the trachea, but in general it can be said that 30 to 40 mg of tetracaine hydrochloride has been used in production of anesthesia for most of these cases.

METHOD AND RESULTS OF STUDY

All the patients enumerated have been studied by careful preoperative evaluation, including a history, an assessment of the general conditions, diagnosis or probable diagnosis, complete physical examination, including blood pressure determination, pulse, and respiratory rate, and a superficial neurological check of the eyes and extremities by a resident member of the surgical or anesthesia service One hundred consecutive patients were studied by serial blood pressure, pulse, and respiratory rate determinations at five minute intervals, before, during, and after anesthesia The remainder of the group were studied preoperatively as described, and with the appearance of any untoward reaction, the patient was immediately restudied by a specially trained team while the patient was being observed or treated This was continued in the postreaction period

There were 19 anesthetic reactions noted in this series of patients Twelve of these were classified as minor, and seven as severe The reactions were considered severe when convulsions or severe respiratory signs appeared, and minor when the reaction did not progress to the signs mentioned above

The pattern of the minor reaction was essentially the same for all the patients in whom it occurred After the application of the fourth pledget (in two) or after the first tracheal instillation (in five) and the second tracheal instillation (in five), the patient complained of weakness or began to show a syncopal type of reaction The pupils were noted to dilate, the skin color became pale or gray, and the patient usually fainted At this time the blood pressure fell precipitously in all these patients, the average reading being 70 systolic, 50 diastolic The pulse became thready, and the pulse rate was usually noted to increase, although this was variable In nine patients the pulse rate was counted at 96 to 140 beats per minute, and in three the pulse rate fell below 80 beats per minute In one patient the pulse rate dropped to 40 beats a minute, and the heart rate on auscultation was found to be the same

When this type of reaction occurred, the patient was immediately placed supine on the floor or on an operating table, and equipment was placed in readiness for intravenous medication and artificial respiration with oxygen If twitchings of the face or hands were noted, or if the reaction was not alleviated within three minutes, the patient was given 5 cc of 2½% thiopental (pentothal®)) sodium solution, and oxygen was given by anesthetic machine and mask Three of these patients were given intravenously thiopental sodium because of the appearance of clonic movements of the fingers Bronchoscopy was performed on all the patients soon after subsidence of the syncopal reaction and the establishment of a near normal blood pressure, or while they were anesthetized with the thiopental sodium solution There were no untoward sequelae noted in any of these patients, and the blood pressure and pulse rate determinations postoperatively were essentially the same as the preoperative values

All the patients in whom these minor reactions occurred were men Their ages varied from 21 to 65 The diagnoses, presumptive or proved, of the underlying chest condition were tuberculosis in seven, bronchogenic carcinoma in two, bronchiectasis in two, and chronic asthma in one In none of the patients was a deleterious effect of the anesthetic reaction noted on the primary disease Repeat bronchoscopy with tetracaine hydrochloride anesthesia was done on three of these patients with tuberculosis, and no untoward results were noted, one of this latter group had received thiopental sodium because of finger twitchings at the time of his initial bronchoscopy

Of the seven severe reactions, six were of the convulsive type, and one was a pronounced bronchospasm with status asthmaticus The consulsive reactions were all essentially the same and varied only in their rapidity of development and intensity of the convulsions An appreciation of these reactions can best be gained by a consideration of the individual patients in whom they were noted, and of whom a brief description follows

REPORT OF CASES

Case 1 —The patient was a white man, 56, on whom bronchoscopy was performed on Aug 12, 1947, because of an undiagnosed lesion in the right upper lung field The patient was anesthetized in the manner described above, and he was transferred from an anesthesia chair to the bronchoscopy table At the time he was placed on the table, he stated that he felt weak and somewhat lightheaded Examination of the patient's pupils at this time revealed that they were moderately dilated and they appeared fixed The patient was placed supine on the operating table, and his blood pressure was taken and revealed a tension of 150 systolic over 90 diastolic This was an increase over his preoperative level, which had been 130/80 The pulse rate had increased from a preoperative level of 92 to 110 As the patient was being studied, it was noted that twitchings were occurring in the fingers of both hands These rapidly progressed to clonic movements of both arms, and the feet were beginning to be involved in these clonic movements A needle was placed in the left antecubital vein and 5 cc of a 2½% solution of thiopental sodium was immediately administered The patient was given oxygen by means of an anesthetic machine and mask At no time was there any distinct change in the character of the patient's respiration or in the depth of respiration There was a complete cessation of the clonic movements of the arms and feet in about 30 sec, and it was noted after three minutes that the blood pressure had decreased to 140/80 The pulse rate however remained at the level of 110 beats per minute The patient was given an additional 5 cc of 2½% thiopental sodium slowly, and the originally scheduled bronchoscopy was carried out.

The patient was observed postoperatively, and there were no untoward results noted in this patient's pulmonary disease or in his general condition The blood pressure gradually fell to the preoperative level, as did the pulse and the respiratory rate

Case 2 —A male veteran, 30, had a bronchoscopy performed because of far advanced, fibrocavitary tuberculosis of the left lung and suspected endobronchial tuberculosis On Jan 10, 1948, after the application of the fourth moistened pledget as described above, the patient was noted to have dilated pupils, and he did not respond to questions, he gradually slumped forward in the chair in which he was sitting for anesthetization He was gently placed on the floor, and at this time the pulse rate was 102 beats per minute and the blood pressure was 90/60 compared to a preoperative pulse rate of 84 and a blood pressure level of 120/80. Twitching movements of the fingers were noted, which rapidly increased to clonic convulsive movements involving the arms, legs, and face, and his body became rigid During this period the blood pressure rose to 140/90 At the onset of the finger twitchings, a needle was placed in the left antecubital vein, and an anesthesia mask was applied tightly to the face Oxygen was administered, and with the onset of clonic convulsions, 10 cc of 2½% solution of thiopental sodium was given intravenously The convulsive state gradually disappeared, and at no time was there obvious interference with the respiratory effort or any changes in the cardiac beat except an increase in the rate The patient was given an additional 5 cc of the thiopental sodium solution He was then transferred to the operating table, and bronchoscopy was performed with the patient asleep There were no untoward results postoperatively, and two subsequent bronchoscopies were performed, 4 and 10% cocaine anesthesia being used, without ill effects

Case 3 —Bronchoscopy was done on a white female nurse, 41, because of chronic, moderately advanced, fibrocavitary tuberculosis of the right upper lobe on May 3, 1948 After application of four moistened pledgets to the pharynx and pyriform sinuses and instillation of ½ cc of solution in the trachea as described above, the following signs were noted within the course of about two minutes the pupils became widely dilated, the patient did not respond to a question, twitching movements of the fingers rapidly progressed to convulsive movements of the facial muscles the entire body was quickly thrown into a tonic and clonic convulsive state, and she assumed the position of opisthotonos The respirations ceased, the patient became extremely cyanotic, and no pulse, blood pressure or heart beat could be obtained At the onset of this reaction, 5 cc of 2½% thiopental sodium was injected into the antecubital vein, and simultaneously artificial respiration was begun by means of an anesthesia machine, a tight fitting face mask and a rebreathing bag being used The convulsive state gradually subsided, and the patient's color returned to normal A heart beat became audible in about three minutes, and the peripheral pulse became palpable at this time A blood pressure of 80/40 was obtained The pulse gradually returned to normal in about five minutes, and the blood pressure rose to 100/80 Spontaneous respirations were resumed in about 15 minutes, and the patient, although asleep, appeared to be normal Bronchoscopy was thereupon performed with no untoward results, and the patient was returned to her room in good condition The patient was closely observed for three hours, and there were no abnormal variations of the pulse, respirations, or blood pressure A later review of the patient revealed no untoward effect on the lung disease or on the cerebral function, although she complained of a severe headache for about 12 hours after she had responded

Case 4.—A white man, 25, had bronchoscopy performed on Sept 14, 1948, because of moderately advanced, unilateral, fibrocavitary tuberculosis. Following the application of the fourth pledget and as the larynx was being visualized for intratracheal instillation of the anesthetic agent, twitching movements of the lips and face were noted These rapidly increased to clonic and tonic convulsions of the extremities and torso, and the patient became cyanotic These events occurred too rapidly to allow studies of the pulse and blood pressure The patient was placed on the operating table and 10 cc of 2½% thiopental sodium solution was injected rapidly into the left antecubital vein Oxygen was given by means of a tight fitting face mask and anesthesia machine The convulsion ceased in about two minutes, the respirations were normal, and the tidal exchange volume had returned to normal by this time The patient's pulse, although rapid (106 beats per minute), was regular The blood pressure was 110/80, which was very similar to a preoperative determination Bronchoscopy was done on the patient while he was anesthetized, and an active endobronchial tuberculosis was noted No untoward effect of the convulsive reaction was noted Two subsequent bronchoscopies were performed on the patient at this hospital without incidence Cocaine was used as the anesthetic agent on one occasion, and tetracaine hydrochloride was utilized as the anesthetic agent in the other

Case 5 —A white man, 52, was to have bronchoscopy performed on Oct 19, 1948, because of a chronic cough and an undiagnosed hilar lesion of the left lung After anesthetization of the pharynx and the instillation of ½ cc in the trachea, an audible wheeze was noted, which was thought to be due to upper respiratory tract spasm After instillation of a second ½ cc of anesthetic solution, however, the patient entered a severe status asthmaticus The patient's respirations became extremely labored, and this was especially noted in the expiratory phase A deep cyanosis rapidly developed The patient s pulse rate rose from a preoperative rate of 98 beats per minute to 126 The blood pressure rose from 120 systolic and 80 diastolic to

180/110 He became very apprehensive, and although preoperatively he had been given sedatives, he showed a hypomanic response

Epinephrine was given subcutaneously repeatedly without apparent effect, and intravenous administration of aminophylline produced no improvement He was given oxygen by a face mask and later helium and oxygen with a slight decrease of the cyanosis During the ensuing 36 hours the patient's condition remained about the same except for a gradual development of bilateral scattered atelectatic areas and rales at the bases For this reason, bronchoscopy was performed with the patient under general ether anesthesia No localized endobronchial lesion was observed, although the patient presented a chronic, asthmatic type of bronchitis After this procedure the patient improved rapidly, and the lung fields were clear to physical and radiologic examination within three days

Case 6—A white man, 52, was anesthetized for bronchoscopy on Dec 14, 1948, as part of an examination of a cystic lesion of the left lower lung. After the second instillation of ½ cc of 2% tetracaine hydrochloride solution into the trachea, the patient complained of feeling very weak and lightheaded, and it was noted that his pupils were becoming dilated He was immediately placed supine on an operating table, and his pulse rate was noted to have increased from 72 to 130 beats per minute, while his blood pressure had dropped from 120/80 to 90/40 After about one minute, twitching movements of the fingers were noted, and the patient was given oxygen by an anesthetic mask, a needle being placed in the left antecubital vein Because of technical difficulties, no thiopental sodium was given for about four minutes, and during this time clonic convulsive movements of the face and extremities developed During this convulsive period the blood pressure determination rose to 150/90, and the pulse rate was counted as 120 beats per minute The convulsive movements stopped before the anesthesia could be given intravenously, but the patient appeared to be in a tense tonic state so that 8 cc of a 2½% thiopental sodium solution was injected, with complete relaxation of the patient Bronchoscopy was then performed with the patient under the anesthesia, and his recovery was uneventful The blood pressure and pulse returned to preoperative values after the patient reacted, and there was no untoward effect on his general condition or on the pulmonary situation

Case 7—A white man, 58, was anesthetized for bronchoscopy on Feb 7, 1949 The patient was known to have pulmonary tuberculosis, and an endobronchial lesion had been suspected from clinical studies The patient had been anesthetized in the usual manner, and a bronchoscope had been passed after the patient was placed in appropriate position As the bronchi were being inspected, an assistant noted the appearance of twitching movements of the hands and forearms The instrument was withdrawn, and arrangements were made for the intravenous administration of thiopental sodium and for a high concentration of oxygen by means of an anesthetic mask During these preparations, the twitching movements became convulsive in character, and they involved the face and extremities There was an apparent respiratory arrest during this period, but no appreciable change in the pulse rate or volume or in the heart rate was noted After the injection of 5 cc of 2½% thiopental sodium solution into the left antecubital vein, the convulsive movements ceased, and the patient resumed normal respiratory movements in about 30 sec He was given an additional 3 cc of solution intravenously, although no further convulsive movements were noted The patient responded in about 20 minutes, and no untoward general or pulmonary complications were noted following this convulsive reaction

COMMENT

The toxicity of the commonly used agents for surface anesthesia has long been recognized, and comparisons of the relative dangers of the drugs have been made by a number of workers[4] Reports of the clinical incidence of these reactions and of the physiologic effect on patients have, however, been few in number The fact that the danger of an anesthetic reaction may be very real was made clear to us by the death of one patient, which we had attributed directly to an anesthetic reaction, and which occurred prior to the study of this series of patients

The fact that these reactions can be prevented and controlled by barbiturates[5] has been a most important factor in our continued use of the local anesthetic drugs We feel that were it not for the use of considerable preoperative medication, the reaction rates from this agent might be higher, and we are certain that the intravenous use of thiopental sodium has prevented a fatal outcome in some of the cases herein reported

The use of the barbiturates alone does not constitute a sufficient safety mechanism, however, and we believe that facilities for oxygen administration and particularly for artificial respiration must be immediately available It is possible that cardiac resuscitation might also be indicated, and for that reason, a surgical setup would be essential In regard to cardiac arrest, it has been our experience that some apparent instances of this complication have not been real, and, therefore, we would advise conservatism in the performance of thoracotomy for patients having these anesthetic reactions

Tetracaine hydrochloride as an anesthetic has been excellent, and we have been impressed by its quick action and the consequent short period of time required for the anesthetization procedure We believe that from a practical standpoint, however, the potential dangers of this drug must be recognized, but we do not mean to condemn the agent for this reason any more than the other local anesthetic drugs can be criticized, because toxic reactions from their use have been seen and reported By the use of small doses, as pointed out by the company marketing tetracaine hydrochloride, and by the proper preoperative medication, the incidence of reactions should be small In addition, the prompt recognition and treatment of reactions should prevent serious complications

The incidence of reactions reported in this series has been much higher than that previously noted, and we have attempted to explain this by a careful survey of the patients in whom the reactions were noted Unfortunately, there have been no significant factors found that might account for these figures The age and physical condition of the patient have not been unusual when compared to the group as a whole, the disease process and the presence of such signs as hemoptysis, wheezing, and allergic manifestations have not been different from the larger group of patients in whom no reactions occurred

In the group of 100 consecutive patients who were studied routinely by serial determinations of the blood pressure, pulse, and respiratory rate, there was a uniform response The blood pressure showed a slight to moderate elevation of both systolic and diastolic levels, and this varied directly with the degree of coughing occasioned by the intratracheal instillation of the solution In addition, there was a moderate elevation of the pulse and respiratory rate It was our impression that these changes were independent of the anesthetic and were more dependent on the patient's apprehension and his response to the procedures These changes usually lasted during bronchoscopy and for an average of one-half hour after the procedure It is interesting that this vascular response was the opposite of that noted in the patients with minor reactions, and also in those with the severe reactions who were studied prior to the onset of convulsions or bronchospasm The fact that the systemic effects of the anesthetic were generally negligible makes the explanation of the toxic reactions very difficult, except on the basis of some idiosyncrasy existing at that time The fact that patients who had had reactions could be reanesthetized without event has further confused our attempts at explaining the mechanism involved

SUMMARY

A study is reported of 1,000 consecutive bronchoscopies in 947 patients, with use of 2% topical tetracaine (pontocaine®) hydrochloride anesthesia, in whom there were 12 minor and seven severe toxic reactions attributed to the anesthetic agent An attempt has been made to evaluate a few physiologic changes in patients anesthetized with tetracaine hydrochloride We feel that tetracaine hydrochloride is an excellent agent for topical anesthesia, but that its danger must be appreciated It should be used with caution in a hospital where adequate preoperative medication can be given and where all resuscitative measures are immediately available

ARTIFICIAL TRANSMISSION OF VIRAL HEPATITIS AMONG INTRAVENOUS DIACETYLMORPHINE ADDICTS

Emanuel Appelbaum, M D
and
Mennasch Kalkstein, M D , New York

During the past few years much attention has been focused on the epidemiology of virus hepatitis, especially the accidental transmission of the disease through parenteral infusions and inoculations The infectiousness of even minute quantities of human blood or serum has been amply demonstrated

The accidental dissemination of various infections among intravenous drug addicts is now a recognized fact Of special interest are reports [1] on the artificial transmission of malaria, tetanus, and bacterial and mycotic endocarditis To the best of our knowledge, there have been no references in the literature to the spread of hepatitis or other viral infections among these patients Recently we had an opportunity of studying three cases of hepatitis among intravenous drug addicts It is the purpose of this paper to record these cases and to draw attention to this mode of spread of hepatitis and to this additional hazard of narcotic addiction

REPORT OF CASES

CASE 1 —C G , a Negro man, 23, admitted to Beth David Hospital, May 21, 1951, complained of fatigue, abdominal discomfort, anorexia and vomiting of three weeks duration, and yellow discoloration of the eyes, pale stools, and dark urine for the past week He had been taking diacetylmorphine (heroin) intravenously for 18 mo and had been sharing his hypodermic outfit with other addicts up to the time of his admission to the hospital The patient had not received any other injection or inoculation for the past four years Early in March, 1951 jaundice developed in a fellow addict, L B , with whom the patient had shared injections up to Feb 20, 1951, and he was admitted to another hospital The patient's past history was irrelevant

The patient was well nourished and did not appear particularly ill However, the scleras and buccal mucous membrane were intensely jaundiced The temperature was 100 F, the pulse rate 100, and the respiratory rate 22 The pupils were equal and reacted to light and in accommodation The lungs were clear The heart was normal The blood pressure was 150 mm of mercury systolic and 90 diastolic There was no abdominal distention, but there was some tenderness on deep pressure over the right hypochondrium The liver and spleen were not palpable Both antecubital fossae and the forearms showed scarring and pigmentation along the course of the veins Except for diminished patellar reflexes, the reflexes were normal

The red blood cell count showed 4,240,000 cells with 90% hemoglobin The white blood cell count was 5,050 with 50% polymorphonuclears, 41% lymphocytes and 9% monocytes Urinalysis showed a specific gravity of 1 017, an occasional white blood cell, a trace of bile and urobilinogen, but no sugar or albumin The erythrocyte sedimentation rate was 11 mm in 15 min Both the Wassermann and Mazzini tests were negative The icteric index was 66, the cephalin flocculation 3+, and the alkaline phosphatase 5 51 units The serum albumin was 4 5 and the globulin 3 8 gm per 100 cc The value for blood urea was 13 mg and for sugar 133 mg per 100 cc A roentgenogram of the chest showed the heart and lungs to be normal

Treatment consisted of bed rest, a high-carbohydrate and high protein diet, and daily administration of liver extract parenterally Diacetylmorphine was not given The clinical course was uneventful, with gradual return of the patient s appetite and subsidence of the abdominal discomfort The jaundice receded slowly A sulfobromophthalein (bromsulphalein®) sodium test done on June 7 showed 40% retention of dye after 45 min The same test repeated two weeks later showed only 2% retention At about the same time the cephalin flocculation test became negative When the patient was discharged from the hospital on July 2, 1951, he showed no jaundice and was in excellent condition The icteric index taken the same day was 17

In this case the diagnosis of hepatitis was definitely established by the clinical picture and laboratory data It is important to note that this patient shared the hypodermic outfit with addict L B , who was treated for hepatitis in another hospital The last time that these two addicts shared injections was about 70 days prior to the onset of the present illness in patient C G The accidental transfer of hepatitis from addict L B to our patient is a reasonable assumption, although the possibility that both patients acquired the disease from a common source cannot be excluded If L B was the source of our patient's infection, then the minimum incubation period was 70 days This would favor a diagnosis of homologous serum hepatitis

CASE 2 —C B , a Negro girl, 16, was admitted to Sydenham Hospital, June 7, 1951, with the complaint of yellowish discoloration of the eyes, a symptom to which her attention was directed by friends on the same day She had noticed that her urine was getting darker than usual for the past three weeks There was no history of nausea, vomiting, or abdominal distress She had been taking diacetylmorphine intravenously for the past two months, sharing a hypodermic outfit with other addicts, one of whom was being treated for hepatitis in another hospital There was no history of blood transfusion or any other parenteral inoculation

The patient was well developed and did not appear acutely ill The temperature was 99 6 F , the pulse rate 88, and the respiratory rate 20 The blood pressure was 115 mm of mercury systolic and 65 diastolic There was poor oral hygiene and coating of the tongue The scleras were icteric The lungs were clear The heart was not enlarged, and the rhythm was regular There was moderate enlargement and tenderness of the liver The spleen was not felt Scarring and pigmentation was seen over the veins of the forearms Some of the veins appeared thickened and sclerosed The reflexes were all normal

The red blood cell count showed 4,610,000 cells, with 11 gm of hemoglobin The white blood cell count was 10,200, with 46% polymorphonuclears and 54% lymphocytes Urinalysis showed a few white blood cells and numerous epithelial cells, but findings were otherwise normal The blood urea was 5 4 mg , the sugar 127 mg , the phosphorus 3 6 mg , the cholesterol 282 mg and the ester 146 mg per 100 cc The serum albumin was 3 6 gm and the globulin 2 6 gm per 100 cc The icteric index was 41, and the van den Bergh showed an immediate reaction on the direct test and 3 5 mg per 100 cc on the indirect test The cephalin flocculation was 4+ and the alkaline phosphatase 13 7 Bodansky units The prothrombin time was 31 sec and the urobilinogen was present in the urine in 1 20 dilution A sulfobromophthalein test done on June 13 showed a 40% retention in the serum 45 min after injection of the dye A roentgenogram of the thorax showed the heart and lungs to be normal

The patient was treated with bed rest a high-carbohydrate and high protein diet, and also lipotropic agents, crude liver, and vitamins Remarkable clinical improvement followed, with clearing of the jaundice and diminution in the size and tenderness of the liver At the request of a probation officer, the patient was discharged from the hospital on June 20 and transferred to the House of the Good Shepherd

In this case the clinical picture and course, combined with the laboratory data warranted a diagnosis of hepatitis The relationship of the patient s illness to narcotic addiction appears probable, since she had shared injections with an addict who was suffering from hepatitis If the patient's statement that she had taken intravenous diacetylmorphine for only two months is correct, then the incubation period of her illness was comparatively short but may have been 60 days The precise form of this patient's hepatitis is therefore a matter of speculation

CASE 3 —W H , a Negro man 24, admitted to Beth David Hospital, June 21, 1951, complained of fatigue, lassitude, abdominal discomfort, and yellow discoloration of the eyes of one week s duration He noticed at the same time that the stools were light-colored and the urine dark He had been taking diacetylmorphine intravenously for the past five months and had been sharing his hypodermic outfit with other addicts His last injection was on June 10 He had not received any other injection during the past year and had not been exposed to any intoxicating chemicals He did not recall encountering any jaundice cases among his fellow addicts Although he knew C G (case 1), he never shared injections with him His past history was irrelevant

The patient was well nourished and did not appear either acutely or chronically ill The temperature was 99 F , the pulse rate 74, and the respiratory rate 18 The pupils were equal and reacted to light and in accommodation The lungs were clear The heart was not enlarged, and the rhythm was regular The blood pressure was 103 mm of mercury systolic and 60 diastolic. The abdomen was soft and not distended There was slight tenderness on deep palpation below the right costal margin The superficial veins of the forearms were thrombosed and scarred All reflexes were normal

The red blood cell count showed 4,810,000 cells, with 94% hemoglobin The white blood cell count was 7,100, with 59% polymorphonuclears, 38% lymphocytes, and 3% eosinophils Urinalysis showed a faint trace of albumin, eight to 10 white blood cells, and a trace of bile and urobilinogen Both the Wassermann and Mazzini tests were negative The cephalin flocculation test was 2+ and the alkaline phosphatase 5 1 units The icteric index was 80 The serum albumin was 3 56 gm and the globulin 3 83 gm per 100 cc The blood urea was 10 mg , the cholesterol 200 mg , and the ester 100 mg per 100 cc The stools appeared clay-colored A sulfobromophthalein test revealed 40% dye retention after 45 min A roentgenogram of the chest revealed the lungs and heart to be normal

The patient was treated with bed rest, a high-carbohydrate and high protein diet and vitamins Response to this regimen was prompt, and the clinical course to date has been very favorable While the patient is still jaundiced he is quite comfortable, and a sense of well being has developed The stools are no longer clay-colored The patient is still under observation

The clinical picture and course and the laboratory findings in this case are consistent with a diagnosis of hepatitis There is no history of definite contact with another patient with hepatitits However, the fact that the patient was an intravenous drug addict suggests very strongly that the hepatic infection was transmitted by means of a contaminated hypodermic outfit In this case it is impossible to determine the incubation period or the precise form of viral hepatitis

COMMENT

It is not within the scope of this paper to discuss the various aspects of hepatitis on which an extensive literature has been accumulated during the past few years Suffice it to mention that the virus etiology of both infectious hepatitis and homologous serum jaundice is now an accepted fact In the three cases reported herein, the history, clinical picture and course, and laboratory data leave no doubt as to the diagnosis of viral hepatitis In case 1 the apparently long incubation period makes the diagnosis of homologous serum jaundice very likely The precise form of hepatitis present in cases 2 and 3 is speculative

As mentioned previously, the transmission of hepatitis through parenteral injections has been established In this connection it may be pertinent to describe briefly the method of group injection practiced by the narcotic addicts The drug used is almost invariably diacetylmorphine and is as a rule administered intravenously The changes were independent of the anesthetic and were more dependent on the patient's apprehension and his response to the procedures These changes usually lasted during bronchoscopy and for an average of one-half hour after the procedure It is interesting that this vascular response was the opposite of that noted in the patients with minor reactions, and also in those with the severe reactions who were studied prior to the onset of convulsions or bronchospasm The fact that the systemic effects of the anesthetic were generally negligible makes the explanation of the toxic reactions very difficult, except on the basis of some idiosyncrasy existing at that time The fact that patients who had had reactions could be re-anesthetized without event has further confused our attempts at explaining the mechanism involved

SUMMARY

A study is reported of 1,000 consecutive bronchoscopies in 947 patients, with use of 2% topical tetracaine (pontocaine®) hydrochloride anesthesia, in whom there were 12 minor and seven severe toxic reactions attributed to the anesthetic agent An attempt has been made to evaluate a few physiologic changes in patients anesthetized with tetracaine hydrochloride We feel that tetracaine hydrochloride is an excellent agent for topical anesthesia, but that its danger must be appreciated It should be used with caution in a hospital where adequate preoperative medication can be given and where all resuscitative measures are immediately available

ARTIFICIAL TRANSMISSION OF VIRAL HEPATITIS AMONG INTRAVENOUS DIACETYLMORPHINE ADDICTS

Emanuel Appelbaum, M D
and
Mennasch Kalkstein, M D , New York

During the past few years much attention has been focused on the epidemiology of virus hepatitis, especially the accidental transmission of the disease through parenteral infusions and inoculations The infectiousness of even minute quantities of human blood or serum has been amply demonstrated

The accidental dissemination of various infections among intravenous drug addicts is now a recognized fact Of special interest are reports [1] on the artificial transmission of malaria, tetanus, and bacterial and mycotic endocarditis To the best of our knowledge, there have been no references in the literature to the spread of hepatitis or other viral infections among these patients Recently we had an opportunity of studying three cases of hepatitis among intravenous drug addicts It is the purpose of this paper to record these cases and to draw attention to this mode of spread of hepatitis and to this additional hazard of narcotic addiction

REPORT OF CASES

CASE 1 —C G , a Negro man 23, admitted to Beth David Hospital, May 21 1951, complained of fatigue abdominal discomfort, anorexia and vomiting of three weeks duration, and yellow discoloration of the eyes pale stools, and dark urine for the past week He had been taking diacetylmorphine (heroin) intravenously for 18 mo and had been sharing his hypodermic outfit with other addicts up to the time of his admission to the hospital The patient had not received any other injection or inoculation for the past four years Early in March, 1951, jaundice developed in a fellow addict, L B , with whom the patient had shared injections up to Feb 20, 1951, and he was admitted to another hospital The patient's past history was irrelevant

The patient was well nourished and did not appear particularly ill However, the scleras and buccal mucous membrane were intensely jaundiced The temperature was 100 F the pulse rate 100, and the respiratory rate 22 The pupils were equal and reacted to light and in accommodation The lungs were clear The heart was normal The blood pressure was 150 mm of mercury systolic and 90 diastolic There was no abdominal distention but there was some tenderness on deep pressure over the right hypochondrium The liver and spleen were not palpable Both antecubital fossae and the forearms showed scarring and pigmentation along the course of the veins Except for diminished patellar reflexes, the reflexes were normal

The red blood cell count showed 4,240,000 cells, with 90% hemoglobin The white blood cell count was 5 050 with 50% polymorphonuclears, 41% lymphocytes and 9% monocytes Urinalysis showed a specific gravity of 1 017, an occasional white blood cell, a trace of bile and urobilinogen, but no sugar or albumin The erythrocyte sedimentation rate was 11 mm in 15 min Both the Wassermann and Mazzini tests were negative The icteric index was 66 the cephalin flocculation 3+, and the alkaline phosphatase 5 51 units The serum albumin was 4 5 and the globulin 3 8 gm per 100 cc The value for blood urea was 13 mg and for sugar 133 mg per 100 cc A roentgenogram of the chest showed the heart and lungs to be normal

Treatment consisted of bed rest, a high-carbohydrate and high protein diet, and daily administration of liver extract parenterally Diacetylmorphine was not given The clinical course was uneventful, with gradual return of the patient's appetite and subsidence of the abdominal discomfort The jaundice receded slowly A sulfobromophthalein (bromsulphalein®) sodium test done on June 7 showed 40% retention of dye after 45 min The same test repeated two weeks later showed only 2% retention At about the same time the cephalin flocculation test became negative When the patient was discharged from the hospital on July 2, 1951, he showed no jaundice and was in excellent condition The icteric index taken the same day was 17

In this case the diagnosis of hepatitis was definitely established by the clinical picture and laboratory data It is important to note that this patient shared the hypodermic outfit with addict L B , who was treated for hepatitis in another hospital The last time that these two addicts shared injections was about 70 days prior to the onset of the present illness in patient C G The accidental transfer of hepatitis from addict L B to our patient is a reasonable assumption, although the possibility that both patients acquired the disease from a common source cannot be excluded If L B was the source of our patient's infection, then the minimum incubation period was 70 days This would favor a diagnosis of homologous serum hepatitis

Case 2 —C B , a Negro girl, 16, was admitted to Sydenham Hospital, June 7, 1951, with the complaint of yellowish discoloration of the eyes, a symptom to which her attention was directed by friends on the same day She had noticed that her urine was getting darker than usual for the past three weeks There was no history of nausea, vomiting, or abdominal distress She had been taking diacetylmorphine intravenously for the past two months, sharing a hypodermic outfit with other addicts, one of whom was being treated for hepatitis in another hospital There was no history of blood transfusion or any other parenteral inoculation

The patient was well developed and did not appear acutely ill The temperature was 99 6 F , the pulse rate 88, and the respiratory rate 20 The blood pressure was 115 mm of mercury systolic and 65 diastolic There was poor oral hygiene and coating of the tongue The scleras were icteric The lungs were clear The heart was not enlarged, and the rhythm was regular There was moderate enlargement and tenderness of the liver The spleen was not felt Scarring and pigmentation was seen over the veins of the forearms Some of the veins appeared thickened and sclerosed The reflexes were all normal

The red blood cell count showed 4,610,000 cells, with 11 gm. of hemoglobin The white blood cell count was 10,200, with 46% polymorphonuclears and 54% lymphocytes Urinalysis showed a few white blood cells and numerous epithelial cells, but findings were otherwise normal The blood urea was 5 4 mg , the sugar 127 mg , the phosphorus 3 6 mg the cholesterol 282 mg and the ester 146 mg per 100 cc The serum albumin was 3 6 gm and the globulin 2 6 gm per 100 cc The icteric index was 41, and the van den Bergh showed an immediate reaction on the direct test and 3 5 mg per 100 cc on the indirect test The cephalin flocculation was 4+ and the alkaline phosphatase 13 7 Bodansky units The prothrombin time was 31 sec , and the urobilinogen was present in the urine in 1 20 dilution A sulfobromophthalein test done on June 13 showed a 40% retention in the serum 45 min after injection of the dye A roentgenogram of the thorax showed the heart and lungs to be normal

The patient was treated with bed rest a high-carbohydrate and high protein diet, and also lipotropic agents, crude liver, and vitamins Remarkable clinical improvement followed, with clearing of the jaundice and diminution in the size and tenderness of the liver At the request of a probation officer, the patient was discharged from the hospital on June 20 and transferred to the House of the Good Shepherd

In this case the clinical picture and course, combined with the laboratory data, warranted a diagnosis of hepatitis The relationship of the patient's illness to narcotic addiction appears probable, since she had shared injections with an addict who was suffering from hepatitis If the patient's statement that she had taken intravenous diacetylmorphine for only two months is correct, then the incubation period of her illness was comparatively short but may have been 60 days The precise form of this patient s hepatitis is therefore a matter of speculation

Case 3 —W H , a Negro man, 24, admitted to Beth David Hospital, June 21, 1951, complained of fatigue lassitude, abdominal discomfort, and yellow discoloration of the eyes of one week s duration He noticed at the same time that the stools were light-colored and the urine dark He had been taking diacetylmorphine intravenously for the past five months and had been sharing his hypodermic outfit with other addicts His last injection was on June 10 He had not received any other injection during the past year and had not been exposed to any intoxicating chemicals He did not recall encountering any jaundice cases among his fellow addicts Although he knew C G (case 1), he never shared injections with him His past history was irrelevant.

The patient was well nourished and did not appear either acutely or chronically ill The temperature was 99 F , the pulse rate 74, and the respiratory rate 18 The pupils were equal and reacted to light and in accommodation The lungs were clear The heart was not enlarged, and the rhythm was regular The blood pressure was 103 mm of mercury systolic and 60 diastolic The abdomen was soft and not distended There was slight tenderness on deep palpation below the right costal margin The superficial veins of the forearms were thrombosed and scarred All reflexes were normal

The red blood cell count showed 4,810,000 cells, with 94% hemoglobin The white blood cell count was 7,100, with 59% polymorphonuclears, 38% lymphocytes, and 3% eosinophils Urinalysis showed a faint trace of albumin, eight to 10 white blood cells, and a trace of bile and urobilinogen Both the Wassermann and Mazzini tests were negative The cephalin flocculation test was 2+ and the alkaline phosphatase 5 1 units The icteric index was 80 The serum albumin was 3 56 gm and the globulin 3 83 gm per 100 cc The blood urea was 10 mg , the cholesterol 200 mg , and the ester 100 mg per 100 cc The stools appeared clay-colored A sulfobromophthalein test revealed 40% dye retention after 45 min A roentgenogram of the chest revealed the lungs and heart to be normal

The patient was treated with bed rest, a high-carbohydrate and high protein diet, and vitamins Response to this regimen was prompt, and the clinical course to date has been very favorable While the patient is still jaundiced, he is quite comfortable, and a sense of well being has developed The stools are no longer clay-colored The patient is still under observation

The clinical picture and course and the laboratory findings in this case are consistent with a diagnosis of hepatitis There is no history of definite contact with another patient with hepatitis However, the fact that the patient was an intravenous drug addict suggests very strongly that the hepatic infection was transmitted by means of a contaminated hypodermic outfit In this case it is impossible to determine the incubation period or the precise form of viral hepatitis

COMMENT

It is not within the scope of this paper to discuss the various aspects of hepatitis on which an extensive literature has been accumulated during the past few years Suffice it to mention that the virus etiology of both infectious hepatitis and homologous serum jaundice is now an accepted fact In the three cases reported herein, the history, clinical picture and course, and laboratory data leave no doubt as to the diagnosis of viral hepatitis In case 1 the apparently long incubation period makes the diagnosis of homologous serum jaundice very likely The precise form of hepatitis present in cases 2 and 3 is speculative

As mentioned previously, the transmission of hepatitis through parenteral injections has been established In this connection it may be pertinent to describe briefly the method of group injection practiced by the narcotic addicts The drug used is almost invariably diacetylmorphine and is as a rule administered intravenously The addicts usually congregate in groups The drug is put into a tablespoon, and tap water is added The contents are then brought to a boiling point by using a candle or match flame A small piece of cotton is put into the tablespoon, and the solution is drawn up through the cotton into a large medicine dropper Strips of paper are wrapped around the tip of the dropper in order to fit the needle After a tourniquet is applied to the arm, the needle is inserted into one of the antecubital veins When the flow of blood into the eye dropper is observed, the tourniquet is released, and the solution is injected into the vein The hypodermic outfit, known as "the works," is never sterilized and is passed around from one addict to another It is obvious that this method lends itself to the transfer of infectious agents from one addict to another

In our patients there can be little doubt that hepatitis was artificially induced in cases 1 and 2 In case 3 the relationship between the hepatitis and the injections is a reasonable assumption It has also come to our attention that other intravenous drug addicts suffering from hepatitis have been admitted to several hospitals in the city during the past few months

There is therefore sufficient evidence that a number of intravenous diacetylmorphine addicts have accidentally acquired viral hepatitis while sharing injections with other addicts who were afflicted with this disease It is not unlikely that more cases of this type will soon be uncovered Attention is thus directed to another hazard of narcotic addiction, namely, the transmission of a virus infection The public health implications of this extraordinary manner of spreading hepatitis cannot therefore be overemphasized This problem assumes particular importance at this time because of the recent exposure of the widespread existence of diacetylmorphine addiction, especially among adolescents

SUMMARY

Three cases of viral hepatitis among intravenous diacetylmorphine (heroin) addicts have been reported It was pointed out that transmission of the disease among these patients was very likely due to the communal use of hypodermic outfits This extraordinary manner of spreading hepatitis focuses attention on another hazard of narcotic addiction and on an important public health problem

ADDENDUM

Since this manuscript was submitted, additional information has become available Hepatitis developed on or about July 10, 1951, in a fellow addict under observation in another hospital, with whom our patient, W H (case 3), had shared injections up to the end of April, 1951 Assuming that our patient was the source of this other addict's infection, the probable incubation period in the new case was approximately 70 days This would favor a diagnosis of homologous serum hepatitis in both patients

It may also be noted that clinical improvement in case 3 was progressive The sulfobromophthalein retention on July 8 was 2%, and the icteric index on July 18 was 13 At the time of discharge on July 21 the patient was in excellent condition

We should also like to record briefly an additional case of hepatitis in a diacetylmorphine addict which has since come under our care On July 28, 1951, P C, a Negro man, 26, was admitted to Beth David Hospital with the complaints of weakness, anorexia, nausea, vomiting, and jaundice of five days' duration He had been taking diacetylmorphine intravenously for the past eight months and occasionally had shared his hypodermic equipment with other addicts On examination the patient appeared acutely ill and asthenic The temperature was 100 F, the pulse rate 84, and the respiratory rate 20 The blood pressure was 140 mm of mercury systolic and 85 diastolic The scleras and mucous membranes were icteric The heart and lungs presented no abnormal findings The liver was moderately enlarged and tender, and the spleen was palpable Both forearms showed scarring and pigmentation along the course of the veins The reflexes were all normal The red blood cell count showed 4,100,000 cells, with 84% hemoglobin The white blood cell count was 3,100, with 49% polymorphonuclears, 38% lymphocytes, 6% monocytes, and 7% eosinophils The urine showed urobilinogen in 1 32 dilution but no bile The icteric index was 53, the cephalin flocculation 2+, and the alkaline phosphatase 3 82 units The blood urea was 13 8 mg, the cholesterol 245 mg, and the esters 125 mg per 100 cc A sulfobromophthalein test showed 45% dye retention after 45 min Treatment consisted of bed rest, high protein and high carbohydrate diet, and the use of vitamins and lipotropic substances Clinical improvement became apparent after several days of therapy This patient is still under observation

Since describing the above patients, one of us (E A) has observed four additional cases of hepatitis among drug addicts, indicating that the disease is spreading in this group

910 Park Ave (Dr Appelbaum)

Psychiatry and Freud—Freud shocked the world of science and of intellect in arguing and in demonstrating both the rationality of the irrational and the irrationality of the rational The first of the two propositions was the less opposed, the second aroused frenzied resentment It is this split with the formal rationalism of his age that distinguishes and separates Freud from his contemporaries in science and psychiatry It was the firm faith of the nineteenth century that "la raison a toujours raison, that memories and shadows were less important than the direct perception of the real world in the clear light of the day " These were the common assumptions of the rationalistic enlightened world It is true that these assumptions were challenged and denied by a few isolated, "eccentric" thinkers—Carlyle, Dostoievski, Baudelaire, Tolstoi, Nietzsche However, none of these was "a man of science," and hence none of them really challenged science Such discomfiture as they caused to science could be neutralized by anatomizing them and exposing, as Max Nordau did, their 'degeneracy " Freud, unlike the other isolated and eccentric thinkers, was a man of science Though many a Nordau tried it, Freud could not be anatomized or his 'degeneracy" exhibited for the pleasure and profit of the intellectual pharisees He stood forth an obdurate challenge to the naïve rationality of the nineteenth century, and he endures as such to this day The antirationalism of Freud proffers some deep and challenging problems—in epistemology, in the dynamics of therapy, in esthetics and morals—problems which few have braved, but with which we must soon come to grips—Iago Galdston, M D., Psychiatry Without Freud, *A M A Archives of Neurology and Psychiatry,* July, 1951

PODOPHYLLUM RESIN IN TREATMENT OF TINEA CAPITIS

Frederick Reiss, M D
and
Dale D Doherty, M D , New York

In a preliminary report[1] evidence was submitted that a 0 2% ointment of podophyllum resin (podophyllin), in an aquaphor® (an oxycholesterol-petrolatum ointment base) or a polyethylene glycol (carbowax®) base, had a beneficial affect upon the course in several cases of tinea capitis Further clinical trial of this medication, while producing results not quite up to earlier expectations, indicated that podophyllum resin was sometimes a useful agent in the treatment of this rather recalcitrant disease

PRESENT INVESTIGATIONS

In every case the diagnosis was made both clinically and by the presence of fluorescence under the Wood light It was further confirmed by microscopic examination of the hair and subsequent culture Each patient was given the routine instructions for the treatment of tinea capitis and a supply of 0 2% podophyllum resin in carbowax® 1500 and each was instructed to apply the ointment twice daily, carefully avoiding contact with his eyes Every patient was informed also of the possibility of an inflammatory reaction following continued use of the ointment When this occurred, the patient was instructed to apply either boric acid compresses or boric acid ointment, depending upon the severity of the reaction In three instances the parents neglected the reaction until heavy crusting resulted In these cases treatment with podophyllum resin was discontinued, and 2% salicylic acid in cottonseed oil was applied under a cap After subsidence of the inflammation the podophyllum resin ointment was reapplied In these children the salve was applied only once a day Our results are tabulated in table 1

TABLE 1 —*Results of Treatment with Podophyllum Resin Ointment*

Organism	Cured			Improved			No Change			Spread While Under Treatment Podophyllum Only	Lost	Total
	Podophyllum and X Ray	Podophyllum Only	Total	Podophyllum and X Ray	Podophyllum Only	Total	Podophyllum and X Ray	Podophyllum Only	Total			
M audouini	24	22	46	3	15	18	3	18	21	0	15	100
M lanosum	0	7	7	0	1	1	0	0	0	0	0	8
T sulfureum	1	0	1	0	0	0	0	0	0	0	0	1
Endothrix (unidentified)	0	1	1	0	0	0	0	0	0	0	0	1
T crateriforme	1	0	1	0	0	0	0	0	0	0	0	1
T violaceum	0	0	0	0	0	0	0	0	0	0	1	1
Total	26	30	56	3	16	19	3	18	21	9	16	121

In all patients with tinea capitis cures were judged by the disappearance of subjective manifestations and the cutaneous lesions, the absence of fungi in slide preparations and cultures, and the absence of fluorescence under Wood light If all these were absent on four consecutive weekly examinations, a patient was pronounced cured

TIME REQUIRED FOR CURES AFTER LOCAL APPLICATION WITH PODOPHYLLUM RESIN OINTMENT

Of the 105 children followed up, cure was achieved in 30 with the local application of a 0 2% podophyllum resin in carbowax® 1500 This varied from two weeks to seven months Table 2 illustrates the time required in various types of infections

TIME REQUIRED FOR CURES WITH X-RAY EPILATION AND SUBSEQUENT APPLICATION OF PODOPHYLLUM RESIN OINTMENT

This group comprises children with widespread involvement of the scalp to whom local therapy with podophyllum resin was given for two months Since in our previous experience in over 20% of our cases there was failure to clear up after x-ray epilation and subsequent antimycotic treatment, it was our conviction that x-ray epilation should be resorted to only after at least eight weeks of local treatment and lack of response to therapy Table 3 illustrates the time required for cure with treatment combining x-ray epilation and subsequent application of podophyllum resin ointment

CURE ACHIEVED IN TRICHOPHYTON (T) SULFUREUM INFECTION

In addition to the above cases, in one case of widespread T sulfureum infection cure was achieved in five and one-half months

CURE ACHIEVED IN INFECTION DUE TO TRICHOPHYTON (T) CRATERIFORME

In one case of a widespread infection due to T crateriforme, a rather resistant type of infection, the lesions cleared in four months

---

[1] Reiss, F and Doherty D D Fungous Infections of the Skin and Scalp A New Approach to Their Treatment New York State J Med 40 1939 1949

COMMENT

From the results obtained it is obvious that podophyllum resin is as efficacious as many other drugs applied in the past In addition to its antifungal activity, a mild inflammatory reaction is observed in some instances which, according to our estimation, is not only harmless but rather beneficial A noteworthy feature of the podophyllum resin treatment is that the infected hair becomes loose and can easily be epilated manually In widespread infections due to M audouini this is particularly desirable, and it becomes very important that the medication have a high antifungal index Comparing our results in tinea capitis caused by M audouini with those obtained by Schwartz and associates [2] and Combes and associates,[3] we feel justified in our conclusions (table 4) Of 73 patients, 30 were cured (42 0%), 16 were improved (21 9%), 18 showed no change (24 7%), 9 showed a spread of the infection while under treatment (12 3%), and 16 did not report back to the clinic for complete follow-up These patients were treated with podophyllum resin only

* One patient had x ray epilation two years prior to the podophyllum resin treatment Various local medications were applied unsuccessfully

† One patient had x ray epilation eight months prior to the podophyllum resin treatment Various local medications were applied unsuccessfully

On the other hand, in a series of 32 patients treated with x-ray epilation and subsequent podophyllum resin application cures were achieved in 26 (81 3%), improvement in 3 (9 4%), and no change was observed in 3 cases (9 4%) While the percentage of cures resulting from treatment that combined x-ray epilation with podophyllum resin application was larger, one should not lose sight of the additional time which was required for this combined treatment (table 3) Each patient who was epilated was treated previously for two months with podophyllum resin ointment, and epilation was instituted only in cases in which the local response was unsatisfactory It is of added importance that in the two series the infected areas were similar in size and distribution and that the previous local therapy and subsequent x-ray epilation did not shorten the course of the disease The fact that children epilated by x-ray had two-months' treatment preceding epilation adds two months to the total length of treatment In both M audouini and M lanosum infections the shortest time for cure was between two and four weeks, and the longest was seven months While seven-months' treatment is not unusual for infections due to M audouini (Schwartz reported up to 10 mo), it is rather uncommon in M lanosum infections However, the fact that M lanosum hardly ever produced an inflammatory reaction in the children reported is indicative of an adaptation to the human host and a behaviour similar to M audouini

While we do not consider podophyllum resin the ideal solution for the treatment of tinea capitis, it is worth considering in our therapeutic armamentarium This is particularly true in instances in which further treatment is necessary after x-ray epilation and in which small isolated areas are being treated over a considerable length of time

SUMMARY

A report is submitted of 121 cases of tinea capitis treated with a 0 2% resin of podophyllum ointment alone and in combination with x-ray epilation Fifty-six patients were cured, 26 with x-ray epilation combined with podophyllum resin treatment and 30 with podophyllum resin treatment alone, 19 improved, and 21 showed no change The agent was useful in some cases of tinea capitis due to M audouini, M lanosum, T crateriforme, and T sulfureum The length of time required to achieve clinical cure in those cases in which podophyllum resin ointment was used alone did not differ appreciably from the length of time required in those cases in which both podophyllum resin and x-ray epilation were used

PROTHROMBIN TIME DETERMINATIONS ON PATIENTS WITH MYOCARDIAL INFARCTION

Ralph S Overman, Ph D
and
Irving S Wright, M D , New York

Recent investigations of the value of anticoagulants in myocardial infarction have indicated the need for a critical analysis of the blood-clotting mechanism in this disease [1] Observations have been reported [2] which suggest that there is an increased tendency toward a coagulation associated with coronary thrombosis Certain studies have yielded evidence that "hyperprothrombinemia" (in reality a summation of factors producing a shortening of the prothrombin time) is one of the factors responsible for the increased clotting tendency [3] The importance of careful inquiry into whether such a state actually exists in patients with coronary thrombosis becomes obvious when the use of the anticoagulant drugs for both treatment and prophylaxis is being considered Opportunity to observe daily prothrombin times in patients in whom coronary occlusion with myocardial infarction developed was afforded us during studies of the use of bishydroxycoumarin (dicumarol®) in this syndrome The data obtained from observations of a group of patients with coronary disease and myocardial infarction, who served as controls and hence did not receive anticoagulants, are presented in this report

HISTORY

The occurrence of thromboembolic complications in myocardial infarction was emphasized in 1937 by Blumer,[4] who reported an incidence of mural thrombi in 50% of his cases Master, Dack, and Jaffe,[5] Falk,[6] Nay and Barnes,[7] and many others, observing different series of patients with myocardial infarction due to coronary occlusion, found significantly high percentages of thromboembolic complications

Observations made to determine whether an abnormal clotting tendency exists in the blood of patients with coronary disease or myocardial infarction have yielded conflicting data Various methods have been employed to investigate the clotting mechanism, ranging from simple determinations of prothrombin time, based on the method of Quick, to the more complex heparin-retardation tests described by Waugh and Ruddick,[8] and the heparin tolerance test of de Takats,[2b] which seems to demonstrate an increased tendency toward coagulation

What has been labeled as hyperprothrombinemia was observed in patients with thromboembolic disease by Shapiro [3] in 1944 Hines and Kessler [9] noted short prothrombin times in eight patients with either coronary or cerebral thrombosis Meyers and Poindexter [10] studied prothrombin times in arteriosclerotic patients employing the Link-Shapiro modification of Quick's method Determinations run every three days for six weeks on 13 patients with acute coronary occlusion revealed no change in the undilute-prothrombin times, but a shortening of one to ten seconds in the dilute-prothrombin times of 10 patients occurred from 24 to 72 hours after the occlusion Prothrombin times determined monthly in 28 patients with coronary sclerosis showed no definite trend Similar shortening of the dilute-prothrombin time in patients with acute coronary occlusion was demonstrated by Peters, Guyther, and Brambel,[11] who found increased prothrombin activity in three of every four persons with coronary occlusion

On the other hand, Cotlove and Vorzimer,[12] using the Link-Shapiro modification of the one-stage method of Quick to determine the prothrombin time, could find no characteristic alteration in the prothrombin time in patients with coronary occlusion or in patients with repeated attacks of angina pectoris Similarly, Tuft and Rosenfield [13] were unable to detect an acceleration of the prothrombin-clotting time in diluted plasma in thromboembolic diseases

METHOD

Prothrombin times were determined by the Link-Shapiro [3] modification of the Quick [14] one stage method The method as routinely used in our laboratory has been previously described [15] Daily prothrombin time determinations were done when possible on whole (100%) plasma and diluted (12 5%) plasma The prothrombin time determinations reported here are on diluted (12 5%) plasma All tests were performed on blood samples taken in the morning and were completed within two hours after the specimens were drawn Seventeen persons with myocardial infarction were used in this study These patients served as controls in the studv at the New York Hospital and hence did not receive anticoagulants The criteria for the diagnosis of

COMMENT

From the results obtained it is obvious that podophyllum resin is as efficacious as many other drugs applied in the past In addition to its antifungal activity a mild inflammatory reaction is observed in some

15 Overman, R. S Newman A A and Wright I, S Plasma Pro- Times in Normal Human Subjects Am. Heart J 39:56 1950

The prothrombin times of whole (100%) plasma are not reported here, because the results are not so clear-cut as those of diluted plasma and if there is a change from normal it is very slight The data on whole (100%) plasma prothrombin times and their significance will be reported in a subsequent communication

In Table 2 the number and percentage distribution of the prothrombin times on diluted (12 5%) plasma for the patients with coronary disease and for normal persons are given It should be noted that the distribution range of prothrombin times on the coronary patients is greater (20 7 to 50 sec) than that of the normal group (32 to 42 sec) This wide distribution range in the coronary group makes any single prothrombin time determination of limited value, but when four or five determinations are done on the same patient over a period of several days the tendency for a shortened diluted-plasma prothrombin time usually becomes apparent

SUMMARY

The dilute (12 5%) plasma prothrombin times of a group of patients with myocardial infarction are compared with those of a group of normal persons The group with myocardial infarction showed a mean prothrombin time of 32 29 sec The mean of the normal group was 38 6 sec This difference is statistically highly significant

EFFECTS OF ULTRAVIOLET-RAY IRRADIATION ON CLOTTING MECHANISM OF PLASMA

Sherman R Kaplan, M D

and

Irving A Friedman, M D , Chicago

Ultraviolet-ray irradiation of human plasma was introduced for sterilizing purposes after recognition of the fact that homologous serum jaundice could be transmitted in this medium Several studies attest to its efficacy in eliminating the virus of homologous serum jaundice [1] and to its safety [2] Recently Cutler, Burbank, and Marzullo [3] reported alterations in the clotting mechanism of irradiated plasma, attributing this to irradiation with ultraviolet rays of 1,849 A , and suggested that such plasma had anticoagulant properties

That certain components of liquid plasma deteriorate with age has been shown in the past [4] At the end of three months the prothrombin concentration is approximately 17% of normal, although the fibrinogen content is still intact. By the end of six months, the prothrombin level is down to 2%, and the fibrinogen has completely disappeared The alterations in the clotting mechanism which Cutler and his associates describe are attributed to the effect of irradiation with short ultraviolet rays We have found that the "MR plasma" used by them refers to liquid plasma collected in September, 1948, and June, 1949 The latter plasma furthermore had been diluted with an equal volume of 5% dextrose in isotonic sodium chloride solution From the evidence cited [4] relative to the deterioration of fibrinogen, such aged and diluted liquid plasma should not be expected to clot upon the addition of thrombin, regardless of ultraviolet-ray irradiation The "complex mechanism" proposed by Cutler and others to explain the ability of 0 3 cc of irradiated plasma to prevent the clotting of 1 0 cc of venous blood is thought untenable No consideration was given by them to the presence of sodium citrate in the plasma, which would be expected to interfere with the in vitro clotting of venous blood Because of these facts, some of the aspects of the coagulation mechanism of irradiated liquid plasma were reinvestigated

MATERIAL AND METHODS

The human plasma used in this study was processed in accordance with the requirements of the National Institutes of Health Ultraviolet-ray irradiation was performed according to the method of Oppenheimer and Levinson [5] Samples of plasma of varying ages, both irradiated and unirradiated, were submitted as unknowns Aliquot fractions, before and after irradiation, were included Prothrombin determinations were done as prescribed by the one-stage method of Quick [6] Thromboplastin was prepared by acetone extraction of human brain The thrombin and heparin used were commercially available compounds [7] in concentrations of 200 units and 10 mg per cubic centimeter, respectively Fresh defibrinated serum was obtained by whipping with glass beads Human serum was prepared in accordance with the method approved by the National Institutes of Health and irradiated in the same manner as the plasma Fibrinogen was prepared according to the method of Ware, Guest, and Seegers [8]

Table 2 shows the number and percentage distribution of the prothrombin times for the two groups

COMMENT

When the mean of the dilute-prothrombin times for these coronary patients was compared with that for the normal persons sampled, the difference was found to be highly significant statistically (Table 1) In other words, it was found that if the true difference between these means had been zero, the probability of obtaining a mean for coronary patients 6 3 sec or more lower than that for normal patients would be less than 1 in 1,000 In fact, the chances that the mean for coronary patients would have exceeded 33 0 sec, or that for normal patients fallen below 38 0 sec, were in each case exceedingly slight. Since the laboratory procedures were identical, except for minute random fluctuations in technic, it must be concluded that some real difference between these groups exists, the dilute prothrombin times for this sample of coronary patients being appreciably lower on the average than those of the normal persons used as controls This test does not in any way, however, reveal the reason for the observed difference

RESULTS

Six sets of experiments were performed The first experiment was done to determine the effect of ultraviolet-ray irradiation (utilizing 1,849 A) on the clotting mechanism of fresh liquid plasma Aliquot samples of plasma before and after irradiation were compared with a fresh oxalated control sample (Table 1) The results show the clotting mechanism of the irradiated plasma to be identical with the aliquot unirradiated sample and the control sample

TABLE 1 —*Effect of Ultraviolet-Ray Irradiation on Clotting of Fresh Liquid Plasma*

	Sample A (From a Single Unirradiated 4 Day Old Plasma Sample)	Sample B (Same as A Except Irradiated)	Sample C (Control Sample of Fresh Unirradiated 1 Day-Old Plasma)
Prothrombin time sec	15 0 15.2	14 4 15 0	15 0 15 0
1 unit thrombin added to 1 cc plasma	29 0 sec (firm clot)	35 0 sec (firm clot)	31 0 sec (firm clot)
1 mg heparin and 10 units thrombin added to 1 cc plasma	50 0 sec fibrin strands	40 0 sec fibrin strands	32 0 sec (firm clot)
1 mg heparin and 20 units thrombin added to 1 cc plasma	85 0 sec (firm clot)	40 0 sec (firm clot)	

The second set of experiments were undertaken to determine the effect of ultraviolet-ray irradiation on the clotting mechanism of three-month-old liquid plasma Aliquot samples, before and after irradiation, were compared with a fresh oxalated control sample (Table 2) The results showed the clotting mechanism of both the irradiated and unirradiated samples to be inferior to that of the control sample The unirradiated aliquot in each instance revealed a more competent clotting mechanism than its respective irradiated aliquot. This was equally true of plasma treated with ultraviolet rays of 1,849 A. and 2,537 A

The third set of experiments compared the clotting mechanism of fresh liquid plasma with that of liquid plasma older than six months, in both the irradiated and unirradiated state (Table 3) All of the older samples, both irradiated and unirradiated, showed the same deterioration of the essential clotting elements

To explain the failure of clot formation in the older liquid plasmas, the fourth set of experiments was performed (Table 4) The addition of either 0 3 cc of irradiated serum (fibrinogen-free) or 0 3 cc of fresh unirradiated defibrinated serum to a mixture of 20 units of thrombin and 1 cc of plasma failed to produce a clot However, with the addition of 0 1 cc of fibrinogen to this mixture, four of the samples of [illegible] plasma clotted By increasing the fibrinogen to 0 3 cc , [illegible] clotting took place in three other samples, and with the addition of 0 5 cc of fibrinogen the last plasma clotted The amount of fibrinogen needed to produce clotting bore no direct relationship either to the age (these being all old plasmas) or to the exposure to irradiation This would suggest that changes other than those already noted occur in aging plasma

The fifth experiment was undertaken to explain the inhibition of clotting of 1 cc of venous blood by the addition of 0 3 cc of irradiated plasma Because Cutler and others noted this phenomenon, they postulated "complex changes" due to ultraviolet-ray irradiation The results of this experiment reveal that a similar quantity of unirradiated plasma also will prevent 1 cc of venous blood from clotting Amounts of 0 3 cc of each of seven fresh irradiated and six fresh unirradiated samples of plasma were added individually to 1 cc quantities of fresh whole blood obtained from 10 normal donors No clot was noted in any of the mixtures at the end of 24 hr Clot formation is also prevented when sodium citrate in serum or isotonic sodium chloride solution, in a concentration similar to that found in citrated plasma, is added to fresh whole blood Quantities of 0 3 cc of citrated isotonic sodium chloride solution and citrated irradiated serum were added to 1 cc of fresh whole blood, and again no clot was noted at the end of 24 hr Clot inhibition of fresh blood, therefore, as observed by Cutler and others, is due solely to the excess citrate and does not depend upon the substrate added

In the sixth experiment 600 cc of irradiated liquid plasma, aged 4, 7, 9, and 10 mo , was administered to each of five recipients Clotting times were determined 48 hr , 24 hr , and immediately prior to administration and at intervals of 1, 2, 24, 48, and 72 hr following the start of the infusion No prolongation of the clotting times could be demonstrated (Table 5)

COMMENT

Our reinvestigation of Cutler and others work has revealed that the clotting of fresh irradiated plasma is practically the same as that of an aliquot unirradiated sample In older plasma, in which prothrombin and fibrinogen deterioration has begun but is not yet complete, the procedure of ultraviolet-ray irradiation does alter the clotting mechanism This alteration is of the magnitude of fractions of a minute and is produced by ultraviolet rays of both 1,849 A and 2,537 A Whether this effect is due to the actual irradiation or is ascribable to the mechanical trauma inherent in the procedure is as yet undetermined The inability of aged plasma to clot is due to fibrinogen deterioration and not to irradiation with ultraviolet rays of 1 849 A , for similar changes are noted in both irradiated and unirradiated plasmas Furthermore, these changes can be completely reversed in

RESULTS

Six sets of experiments were performed The first experiment was done to determine the effect of ultraviolet-ray irradiation (utilizing 1,849 A) on the clotting mechanism of fresh liquid plasma Aliquot samples of plasma before and after irradiation were compared with a fresh oxalated control sample (Table 1) The results show the clotting mechanism of the irradiated plasma to be identical with the aliquot unirradiated sample and the control sample

The second set of experiments were undertaken to determine the effect of ultraviolet-ray irradiation on the clotting mechanism of three-month-old liquid plasma Aliquot samples, before and after irradiation, were compared with a fresh oxalated control sample (Table 2) The results showed the clotting mechanism of both the irradiated and unirradiated samples to be inferior to that of the control sample The unirradiated aliquot in each instance revealed a more competent clotting mechanism than its respective irradiated aliquot. This was equally true of plasma treated with ultraviolet rays of 1,849 A and 2,537 A

The third set of experiments compared the clotting mechanism of fresh liquid plasma with that of liquid plasma older than six months, in both the irradiated and unirradiated state (Table 3) All of the older samples, both irradiated and unirradiated, showed the same deterioration of the essential clotting elements

To explain the failure of clot formation in the older liquid plasmas, the fourth set of experiments was performed (Table 4) The addition of either 0 3 cc of irradiated serum (fibrinogen-free) or 0 3 cc of fresh unirradiated defibrinated serum to a mixture of 20 units of thrombin and 1 cc of plasma failed to produce a clot However, with the addition of 0 1 cc of fibrinogen to this mixture, four of the samples of [illegible] plasma clotted By increasing the fibrinogen to 0 3 cc , [illegible] clotting took place in

COMMENT

Our reinvestigation of Cutler and others' work has revealed that the clotting of fresh irradiated plasma is practically the same as that of an aliquot unirradiated sample In older plasma, in which prothrombin and fibrinogen deterioration has begun but is not yet complete, the procedure of ultraviolet-ray irradiation does alter the clotting mechanism This alteration is of the magnitude of fractions of a minute and is produced by ultraviolet rays of both 1,849 A and 2,537 A Whether this effect is due to the actual irradiation or is ascribable to the mechanical trauma inherent in the procedure is as yet undetermined The inability of aged plasma to clot is due to fibrinogen deterioration and not to irradiation with ultraviolet rays of 1,849 A, for similar changes are noted in both irradiated and unirradiated plasmas Furthermore, these changes can be completely reversed *in* both by the addition of fibrinogen It has also been shown that the concentration of sodium citrate used in the routine collection of blood to prepare plasma is such that 0 3 cc of plasma will prevent the clotting of 1 cc of blood Identical inhibition of clotting can be produced by the use of citrated isotonic sodium chloride solution or citrated serum This phenomenon is apparently due entirely to the anticoagulant properties of sodium citrate The administration of 600 cc of aged irradiated liquid plasma did not affect the clotting mechanism of any of five recipients

How can one reconcile the established clinical efficacy of stored liquid plasma with the knowledge that such plasma is incoagulable by virtue of prothrombin and fibrinogen deterioration? The answer lies in the fact that the *normal* circulating prothrombin and fibrinogen are in such excess as to be able to compensate for their absence in the infused plasma Furthermore, significant hypoprothrombinemia is practically nonexistent, except in bishydroxycoumarin (dicumarol®) poisoning and the absence of bile from the intestinal tract Hypofibrinogenemia or afibrinogenemia is a rare congenital disturbance, which manifests itself early in life Too much stress has been placed on the presence of prothrombin and fibrinogen in plasma For all practical purposes, these substances are rarely needed when plasma is used In the occasional circumstance when fibrinogen or prothrombin is required, it is best to use fresh whole blood rather than plasma

CONCLUSIONS

The ultraviolet-ray irradiation of fresh plasma does not alter its clotting mechanism In plasma in which prothrombin and fibrinogen deterioration has begun, changes in the clotting mechanism are produced by ultraviolet-ray irradiation, utilizing either 1,849 A or 2,537 A These changes are of the magnitude of fractions of a minute The inability of aged liquid plasma to clot upon the addition of thrombin is due to the disappearance of fibrinogen, this process can be reversed by the addition of fibrinogen This is equally true of both irradiated and unirradiated liquid plasma The inhibition of in vitro clotting of fresh blood by the addition of plasma is due to the sodium citrate in the plasma The administration of aged irradiated liquid plasma in 600 cc quantities has no effect on the clotting mechanism of recipients

The underlying physiological disturbances responsible for death during the course of acute infections remain a mystery Thousands of years ago men began to record descriptions of febrile illnesses A particular type of rash might be accompanied by a slow or fast pulse and by a steady or remitting type of fever, which would run its course within a reasonably constant period of time and would be followed by a period of convalescence On the basis of clinical observations, various specific diseases were separated from one another—the small from the great pox, the typhuslike, or typhoid, fever from typhus In the course of some acute infections the appearance of edema was noted, in others edema was not visible, but diuresis occurred during recovery—an observation which suggested that fluid was retained in the tissues, whether it was obvious or not With the introduction of immunologic techniques, it was recognized that the patient would react to the infecting agent with demonstrable immune responses, which could be used for confirmation of the diagnosis or for prognosis

In addition to the observations on acute generalized diseases, excellent clinical descriptions of different types of local infections in wounds or the skin were recorded Lesions characterized by a thin serous exudate, or by uniform red swelling having a sharp and rapidly spreading raised edge in the skin (erysipelas), were contrasted with those having a thick purulent exudate or with more localized swelling which remained circumscribed (a boil or carbuncle) It was recognized that the redness and heat of the inflammation were the result of a local increase in blood flow The swelling was attributed to a loss of fluid from the blood into the tissues The pain was ascribed to stimulation of nerve endings—the result of an increase in the tension of tissues, produced by the accumulation of fluid If the local infection were adjacent to a serous cavity, fluid might accumulate in that space, in tuberculosis, for instance, a pleural effusion might develop early Because of its higher protein content, the exudate produced by infection was recognized to clot more readily than fluid accumulating as the result of mechanical factors, such as heart failure or venous and lymphatic obstruction

On the supposition that the body's reaction to generalized infectious diseases might follow the same general principles involved in its response to localized infections, we began to make observations in various specific fevers Any alteration in the permeability of membranes occurring during the course of an infection should affect the

This article has been abbreviated for publication in THE JOURNAL by omission of Figures 3 4 5 10 12 13 14 and 17 These will appear in the authors reprints

Read before the Section on Experimental Medicine and Therapeutics at the Ninety Ninth Annual Session of the American Medical Association San Francisco June 29, 1950

These studies were aided (in part) by research grants from the John and Mary R Markle Foundation the National Heart Institute of the National Institutes of Health, Public Health Service, and the Atomic Energy Commission under a contract with the Bowman Gray School of Medicine

fluids in the entire vascular tree, as well as their local distribution in the affected tissues Changes in the general circulation would explain the clinical observations that a weak pulse, faint heart sounds, and cyanosis frequently precede death during infectious diseases[1] Direct toxic myocardial damage (central circulatory failure) might then be differentiated at the bedside from peripheral collapse (peripheral circulatory failure) resulting from toxemic alterations in the permeability of membranes

ALTERATIONS IN PERMEABILITY ASSOCIATED WITH SPECIFIC DISEASES

Alterations Occurring Within Minutes to Hours—Meningococcemia In meningococcemia the integrity of membranes may be altered within a matter of minutes or hours The characteristic hemorrhagic rash is due to the rupture of capillaries by groups of organisms A loss of capillary tone may lead rapidly to a picture of peripheral circulatory collapse, without appreciable alteration in the permeability of membranes or without visible edema Such a sequence of events occurred in the case of a girl 17, who was admitted to the hospital with a typical rash (Fig 1) and with circulatory failure The simple administration of isotonic sodium chloride solution to correct dehydration and increase the circulating blood volume was all that was required to support the circulation (Fig 2) The acute symptoms of infection were controlled with chemotherapy

In these mild cases of meningococcemia, slight edema may be evident after several days, in this patient subcutaneous pitting edema developed, and the plasma proteins were found to be low Plasma was then administered to correct the hypoproteinemia This therapeutic measure apparently increased the circulating blood volume to such an extent (once the alteration in the permeability of membranes was corrected) that an esophageal varix (the result of a pre-existing Banti's syndrome) ruptured, and hemorrhagic shock occurred Whole blood was given to replenish that lost from the circulation This time the increase in blood volume produced central circulatory failure, which led to a fatal pulmonary infarction

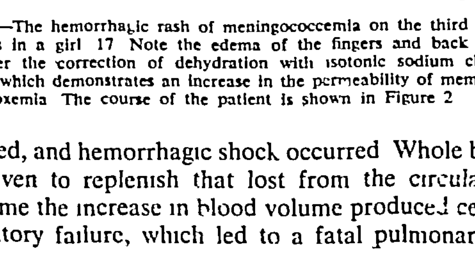

Fig 1—The hemorrhagic rash of meningococcemia on the third day of symptoms in a girl 17 Note the edema of the fingers and back of the hand after the correction of dehydration with isotonic sodium chloride solution which demonstrates an increase in the permeability of membranes due to toxemia The course of the patient is shown in Figure 2

In the hyperacute form of the disease, circulatory failure develops too rapidly for edema to become visible Such was the case with an elderly shoemaker who entered the hospital with peripheral circulatory failure so severe that it had produced collapse of the neck and arm veins, as well as a fall in the arterial blood pressure Because of the severity of the vascular collapse and the presence of deep cyanosis and coma, bilateral adrenal hemorrhage was suspected Isotonic sodium chloride solution was given to correct the dehydration, but no clinical improvement resulted Large amounts of plasma were then administered intravenously, but the blood pressure did not rise (Fig 3) Since the failure of these initial therapeutic measures tended to confirm the clinical impression of adrenal failure, an aqueous solution containing 500 units of adrenal cortical hormone (50 dog units per cubic centimeter) was given intravenously A dramatic change in the patient's clinical condition occurred after the administration of the first 150 units The blood pressure rose, the veins filled, and the patient roused from his coma No edema appeared, but some hours later a gallop rhythm was noted and the neck veins rapidly became distended Acute myocardial failure developed, and the patient died[2]

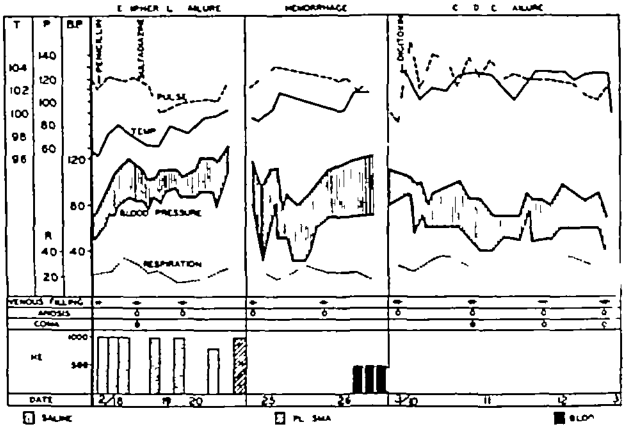

Fig 2—Three different types of circulatory failure occurring successively in a girl 17 with meningococcemia with meningitis circulatory failure and pre-existing Banti s syndrome Note the correction of the peripheral circulatory failure by therapy with isotonic sodium chloride solution alone and the prompt response to chemotherapy The skin rash and edema visible in this patient on the second hospital day are shown in Figure 1 No appreciable change in the permeability of membranes occurred with the hemorrhage Pulmonary and peripheral edema occupied the central myocardial failure An adrenal gland removed at necropsy is shown in Figure 4

The vascular changes occurring early in the course of meningococcemia are due to toxemia from products of the infecting organism and to dehydration The differentiation between simple toxemic peripheral circulatory collapse and that due to adrenal destruction (Waterhouse-Friderichsen syndrome) can be made clinically at the bedside and confirmed at necropsy The adrenals in the girl showed no evidence of hemorrhage, in the man both adrenals were completely destroyed by [illegible] hemorrhage (Fig 4) It is evident that the clinical differentiation between peripheral vascular collapse due to infection alone and that due to adrenal cortical destruction was correctly made in both cases In the latter case the distribution of fluids was not appreciably altered by the adrenal cortical deficiency The severe peripheral collapse caused the blood pressure to fall below the level necessary for adequate glomerular filtration The defect in the reabsorption of sodium by the renal tubules, which leads to the excessive loss of water and salt as well as to retention of potassium, did not have time to develop, as it does in the chronic deficiency of the cortical hormone which we recognize as Addison's disease

[1] Harrell G T Disturbances of the Circulation in Acute Infections North Carolina M J 8 549 563 (Sept) 1947

[2] Harrell G T Case Report Clinico-Pathological Conference North Carolina M J 7 562 565 (Oct) 1945

Alterations Occurring Within Hours or Days—Pneumococcus Lobar Pneumonia In pneumococcus lobar pneumonia alterations in the permeability of membranes occur over a period of hours or days Many years ago it was discovered that chlorides were lost from the circulating blood stream but retained in tissues during the acute phase of the disease [3] Later observations demonstrated that the extravascular space (measured by the dilution of injected thiocyanate ions) and the circulating blood volume (measured by the Evans blue technique) were increased [4] Apparently the chloride and its companion ions take water with them as they leave the vascular tree The defect in permeability is apparently not great enough to decrease the blood volume

These observations offer a logical explanation of the mechanism responsible for the tendency of the right side of the heart to fail during pneumonia, particularly after the excessive administration of intravenous fluids The usual increase in blood volume is exaggerated by the additional fluids, and the myocardium is overloaded The favorable response to digitalis which has been noted by older clinicians is probably due to correction of the central (myocardial) circulatory failure A direct peripheral action on the permeability of blood vessels which apparently mobilizes tissue fluids may also play a part [5]

The additional factor of anoxia, which has long been recognized as a contributing cause for alterations in the permeability of membranes, can be illustrated more clearly in pneumococcal pneumonia than in some other infections The presence of the pulmonary lesion decreases the size of the vascular bed available for oxygenation of the blood, and cyanosis develops

Alterations Occurring Within Days or Weeks—Trichinosis In trichinosis the alteration in the permeability of membranes is pronounced and develops more gradually—over a period of days or weeks The earliest diagnostic sign, splinter hemorrhages in the nail beds, is due to traumatic rupture of capillary loops, with extravasation of blood, as larvae migrate from the circulation into muscles (Fig 5) [6] The accumulation of edema fluid, especially around the eyes, has been recognized as one of the most frequent early clinical manifestations of the disease In severe trichinosis the accumulation of fluid during the stage of edema is associated with oliguria, which lasts from one to two weeks and is followed by diuresis Serial determinations of the blood proteins made in clinically severe cases of the disease have revealed hypoproteinemia [7] The reversible psychic disturbances occasionally seen during the stage of edema suggest an excessive hydration of nerve cells

By the time edema is recognizable, evidence of immunity can be detected in the blood by a positive precipitin reaction or in the cells by a positive skin test This sequence of events suggests the possibility that immunologic mechanisms may play some part in the physiological disturbances associated with the disease This thesis has been tested by the experimental production of the disease in rabbits [8] The physiological changes associated with alterations in the permeability of membranes were maximal just before humoral antibodies (precipitins) appeared (Fig 6)

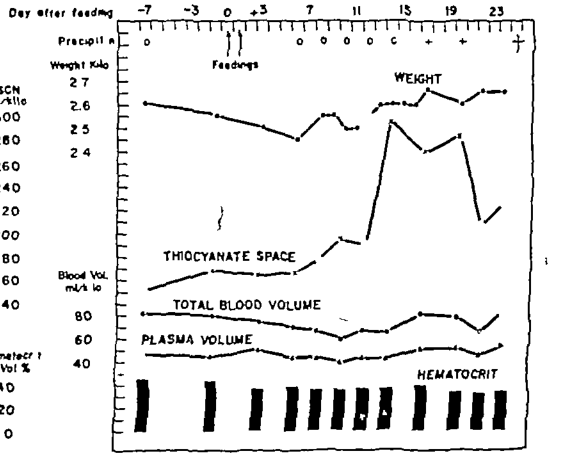

Fig 6—*Fluid* changes in a rabbit fed 6 gm of trichinous rat meat Note the increase in the thiocyanate space on the 14th day after the first feeding without a relative increase in body weight The blood volume was *decreased slightly* during the 10th to 14th days The physiological changes were beginning to reverse when the precipitin test became positive in the serum on the 17th day This rabbit was severely ill but died as the result of hematopericardium on the 25th day

Rickettsial Spotted Fever During the acute phase of Rocky Mountain spotted fever, the anatomic lesion is clearly reflected in the visible rash The histological picture is essentially one of arteritis, with necrosis and thrombosis of the walls of arterioles beginning at the capillary junction The physiological disturbance, however, may be out of all proportion to the number of pathological lesions The permeability of the membranes gradually increases during the first two weeks of the disease, and evidences of this increase are detectable generally throughout the body, often at some distance from the arteriolar lesions [9]

Early in the course of the disease dehydration, accompanied by a rise in the nonprotein nitrogen and a decrease in blood chlorides, may be noted [10] The administration of solutions of crystalloids, dextrose, and isotonic sodium chloride would seem to be indicated in such a situation When crystalloids are given, however, the blood pressure may fall to shock levels and edema which has been minimal may become more pronounced (Fig 7) At the time that circulatory failure or edema is detected, the level of the blood proteins are found to be low, the administration of preformed human protein in the form of albumin, plasma, or whole blood is then indicated

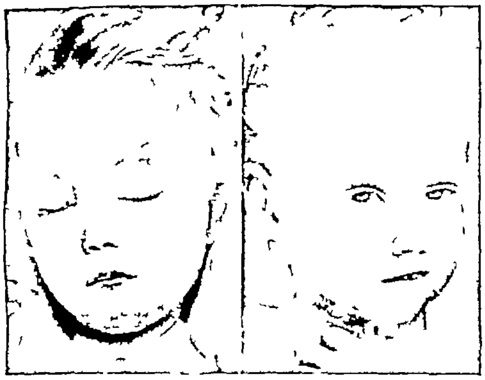

Fig 7—Marked edema in a girl 4 yr severely ill with Rocky Mountain spotted fever The photograph on the left was made on the 16th day of rash The photograph on the right, taken three weeks later during convalescence illustrates the subsidence of edema with recovery The clinical course of the patient is summarized in Figure 8

Studies on the mechanism responsible for the circulatory changes have shown that the thiocyanate space is increased and the blood volume decreased during this critical period (Fig 8) [11] When the intravascular osmotic pressure is maintained with plasma or blood, fluid is retained in the circulation, the blood pressure is increased, and the kidneys' powers of filtration are improved Edema is decreased, and the effects of the physiological disturbances resulting from changes in permeability are lessened If fluids are properly selected, large amounts may safely be given parenterally We have, for instance, previously reported the case of a small child whose entire circulating blood volume was twice completely replaced, first with an equivalent amount of proteins and then with an even larger amount of crystalloids [12]

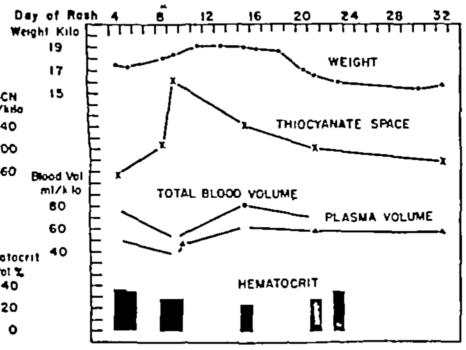

Fig. 8—Alterations in the fluid spaces in a girl 4 yr severely ill with Rocky Mountain spotted fever which was treated with supportive therapy alone Note the rise in thiocyanate space with a drop in the blood volume on the 10th day of rash These changes were accompanied by peripheral circulatory collapse which was successfully treated by intravenous administration of human serum albumin The photograph of this patient, on the left of Figure 7 was taken after the clinical peak of the disease as the symptoms were beginning to subside

The early administration of effective chemotherapeutic agents which directly attack the rickettsiae will rapidly change the character of the rash (Fig 9) and prevent the development of further edema (Fig 10) [13]

Alterations Occurring in Immune Reactions—Serum Sickness When humoral antibodies produced by an immunized animal are used to assist the patient in overcoming his infection, another illness, serum sickness, often results In many of its clinical aspects, such as fever, malaise, and skin eruption, serum sickness resembles an infectious disease Indeed, edema, wheals in the skin, and swelling of the joints have long been recognized as prominent features of this illness, all these suggest that immune reactions can produce alterations in the permeability of membranes In serum sickness resulting from the administration of Rocky Mountain spotted fever antiserum prepared in rabbits, measurements of the extravascular space (by the thiocyanate technique) show the same alterations which are seen in the original infection (Fig 11) Similar changes have been observed in patients who have received diphtheria antitoxin prepared in horses (Fig 12) After the administration of antireticular cytotoxic serum (ACS) prepared in rabbits, alterations in permeability have been demonstrated in the absence of any infection An increase in the thiocyanate space and a decrease in the blood volume have been found to occur in serum sickness experimentally

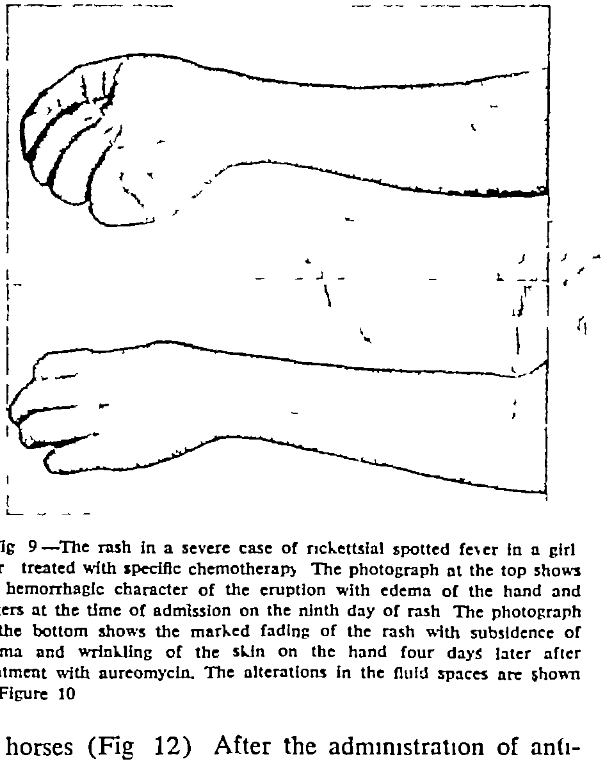

Fig 9—The rash in a severe case of rickettsial spotted fever in a girl 8 yr treated with specific chemotherapy The photograph at the top shows the hemorrhagic character of the eruption with edema of the hand and fingers at the time of admission on the ninth day of rash The photograph at the bottom shows the marked fading of the rash with subsidence of edema and wrinkling of the skin on the hand four days later after treatment with aureomycin. The alterations in the fluid spaces are shown in Figure 10

necessary for adequate glomerular filtration The defect in the reabsorption of sodium by the renal tubules, which leads to the excessive loss of water and salt as well as to retention of potassium, did not have time to develop, as it does in the chronic deficiency of the cortical hormone which we recognize as Addison's disease

[13] Harrell G T Meads M and Stevens K Aureomycin" A New Orally Effective Antibiotic Clinical Trial in Rocky Mountain Spotted Fever Results of Susceptibility Tests and Blood Assays Using a Turbidimetric Method South M J 42:4-13 (Jan) 1949

The clinical picture of serum sickness may follow the injection of antibiotics, such as penicillin (Fig 13) When this reaction occurs, circulating antibodies to penicillin (precipitins) are usually detectable In other instances the immune (or sensitivity) reaction appears to take place predominantly on cells and is manifested by dermatitis, often with exfoliation

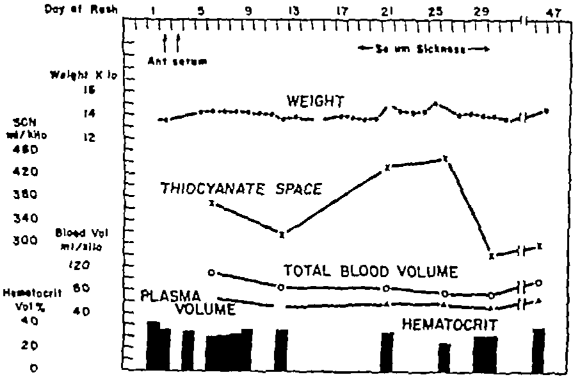

Fig 11 —Alterations in the fluid spaces in a girl 3 yr with moderately severe rickettsial spotted fever treated with specific rabbit antiserum Note the decrease in thiocyanate space on the 11th day as the clinical symptoms began to subside The development of serum sickness on the 18th day after injection of Rocky Mountain spotted fever antiserum reproduced symptoms of infection with fever and edema accompanied by a second rise in the thiocyanate space The symptoms of serum sickness were controlled by the oral administration of diphenhydramine (benadryl®) hydrochloride with return of the thiocyanate space to baseline values

Prolonged serum sickness developed in one of our patients who received penicillin suspended in oil Since the patient was known to have had repeated episodes of stomatitis following the ingestion of peanuts, the sensitivity was thought to be due to the peanut oil used as a menstruum and not to the penicillin Apparently the injection of any material which is allergenic to a particular patient may produce alterations in the permeability of membranes (Fig 14)

COMMENT

Alterations in Capillary Permeability —The observations reported can be interpreted as indicating an increase in the permeability of the vascular tree, permitting the progressive loss of crystalloids, colloids, and red blood cells from the circulation as the magnitude of the capillary defect increased with the clinical severity of the disease The alterations in the vascular tree can be visualized as a series of pores or openings in the capillary wall where the normal extravascular circulation of crystalloids and, to a lesser extent, of small protein molecules is known to occur In mild cases, water and ions which normally traverse the membranes would leave the blood more readily Larger molecules, such as albumin and other proteins, would be lost in severer instances, while red blood cells would pass out of the vascular tree only in the extremest reactions

Alterations in Permeability of Cellular Membranes —The permeability of cell membranes is probably altered too, though no techniques are available for direct measurement of cellular changes Viruses and rickettsiae are obligate intracellular parasites Many bacterial infections—particularly those with a chronic or prolonged course, such as tuberculosis and brucellosis —pass through a phase in which the organisms are found intracellularly During this stage the diffusion of toxemic products of the organism must be through the cell wall, with the attendant danger of damage Furthermore, any immune reaction would take place within the cell, so that substances released in the process would affect primarily the parasitized cells Additional light on the problem of cellular permeability may be shed by experiments now in progress,[15] utilizing the radioactive isotopic dilution technique with Na^{24} and K^{42}

In children acute infections accompanied by diarrhea are reported to produce a potassium deficiency How much of this deficiency is due to a change in the permeability of cellular membranes as a result of the infection itself and how much is due to the disturbances in fluid balance associated with the diarrhea is unknown In either event potassium moves out of the cell in which the membrane of the cell wall normally retains it and is lost in the urine or feces

An analogous situation in which the permeability of cellular membranes is altered in the absence of infection is illustrated by the edema occurring in a young woman with drug intoxication which followed the therapeutic administration of an arsenical preparation (Fig 15) Arsenic apparently poisons intracellular enzyme systems which contain sulfhydryl (SH) groups in the molecule The administration of British anti-lewisite (BAL), a substance which has large numbers of accessible sulfhydryl groups, will rapidly correct the enzymatic defect by combining with the metal With correction of the defect, the alteration in the permeability of membranes is reversed and edema disappears (Fig 16) Observations of this type may give further clues to the mechanism responsible for production of cell defects Such

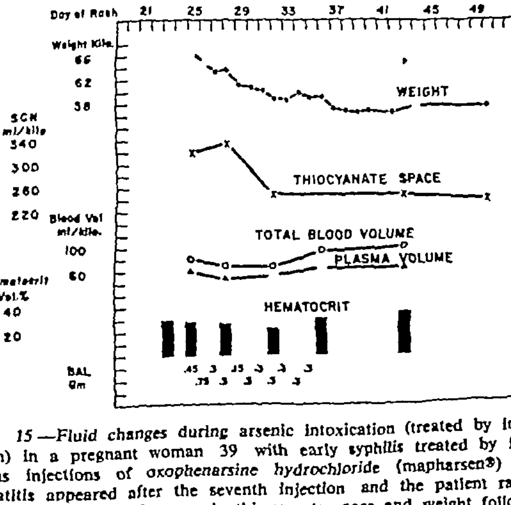

Fig 15—Fluid changes during arsenic intoxication (treated by inactivation) in a pregnant woman 39 with early syphilis treated by intravenous injections of *oxophenarsine hydrochloride* (mapharsen®) The dermatitis appeared after the seventh injection and the patient rapidly became ill Note the decrease in *thiocyanate space* and weight following the administration of BAL. Clinical photographs of the patient are shown in *Figure 16*

questions are of more than academic interest, and are important in the design of therapy for acute infections Intracellular enzyme systems are greatly affected by the hydration of cells and by the intracellular concentrations of ions from salts

[15] Aikawa J K The Significance of the Radiosodium Space in Human Disease A Comparison with the Thiocyanate Space South M J [illegible] 654-[illegible] (July) 1951

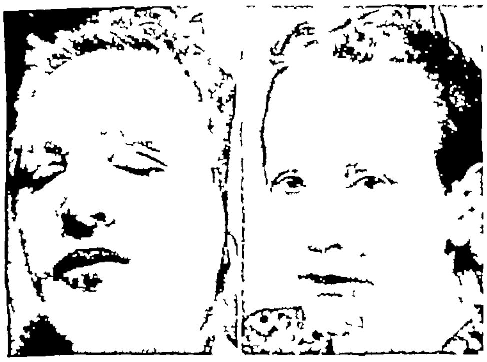

Fig. 16—Edema and exfoliative dermatitis due to arsenic intoxication in a pregnant woman 39 The photograph on the left was taken on the 27th day of rash two days after the institution of therapy with British anti-lewisite. Note the generalized character of the edema and the scaling of dead skin. The photograph on the right was taken three months later showing complete subsidence of signs The patient presented essentially the same appearance two weeks after the institution of therapy illustrating how rapidly changes in permeability may revert with repair of the cellular defect

Therapeutic Possibilities —When infections produce an alteration in the permeability of membranes, treatment with maximum therapeutic doses of effective chemotherapeutic agents should be begun promptly in order to reduce the number of organisms and to prevent further damage In diseases which frequently produce severe alterations in permeability—the rickettsial diseases, for example—every attempt should be made to prevent, in so far as possible, the development of the full-blown clinical picture seen in the natural course of the disease

Salt, dextrose, and water must be administered with care The drop in circulating proteins may be prevented or limited by the administration of a high-protein diet from the beginning of therapy [16] When the patient is seen late in the course of the disease, after the proteins in the blood and tissues have been depleted, or after acute circulatory collapse has developed, preformed proteins in the form of concentrated human serum albumin, plasma, or whole blood must be administered Fluid replacement therapy in specific diseases and under specific circumstances is discussed further in the illustrative cases presented in the section entitled "Alterations in Permeability Associated with Specific Diseases "

The fact that, in patients with serum sickness, administration of antihistaminic drugs relieves the joint pain and swelling and causes the wheals to disappear suggests that these drugs may find a useful place in the treatment of acute infections which have a large element of hypersensitivity Salicylates and the closely related chemical compounds para-aminobenzoic acid (PABA) and procaine have long been successfully employed in the treatment of disease associated with immune reactions

Metabolic factors which affect the permeability of membranes during the course of infections are as yet poorly understood It is not known whether the increase in metabolic rate observed during infections is an attempt by the body to compensate for the defect in permeability by increasing thyroid function It is well recognized, however, that when the thyroid function is lowered, as in myxedema, the membranes become more permeable and fluid is retained in the tissues [15] The salicylates apparently help to correct the defect in permeability in serum sickness, they may, through their antipyretic effect, also depress the increased level of metabolic activity

Many ingenious theories have been proposed concerning the role of the adrenal in acute infections or in diseases which are indirectly related to the stress of illness [17] In instances of adrenal destruction (Waterhouse-Friderichsen syndrome) occurring during meningococcemia, the indications for hormone-replacement therapy are clear The decision to use adrenal cortical hormones must be made on clinical grounds The necessary observations on the pulse, respirations, blood pressure, venous filling and the degree of cyanosis and edema can be made at the bedside with the equipment usually carried in a physician's bag

Corticotrophic hormone (ACTH) or cortisone often will dramatically relieve the symptoms of serum sickness and quickly restore the physiological integrity of the membranes (Fig 14) In patients with pneumonia a reduction in the degree of toxemia and an increase in the sense of well-being following the administration of these hormones have been reported [18] The possible usefulness of these hormones in the treatment of diseases which characteristically are associated with high degrees of allergy, such as tuberculosis, is still under investigation It should be emphasized that the infecting agent is not attacked by the hormones and that they have no effect on bacteremia, if this is present, their action is solely on the tissues of the host The suppression of toxemic reactions in the host may actually be accompanied by an increase in the number of organisms and an exacerbation of the disease [19] This sequence of events has long been recognized by clinicians in the recrudescence of clinical tuberculosis following the termination of pregnancy

The sudden release of large amounts of antigen by the rapid destruction of organisms (such as the Herxheimer reaction which occurs in syphilis after the initial injection of penicillin) or by the dissolution of a granuloma (as occurs in some fungus infections after the administration of iodides) may not prove so detrimental to the patient if the harmful effects of the antigens on sensitized cells can be ameliorated by hormone therapy Conversely, the apparent stimulating effect which hormone therapy has on the growth of the etiological agent may possibly be produced in rabbits by the injection of fractions of human plasma[14]

The clinical picture of serum sickness may follow the injection of antibiotics, such as penicillin (Fig 13) When this reaction occurs, circulating antibodies to penicillin (precipitins) are usually detectable In other instances the immune (or sensitivity) reaction appears to take place predominantly on cells and is manifested by dermatitis, often with exfoliation

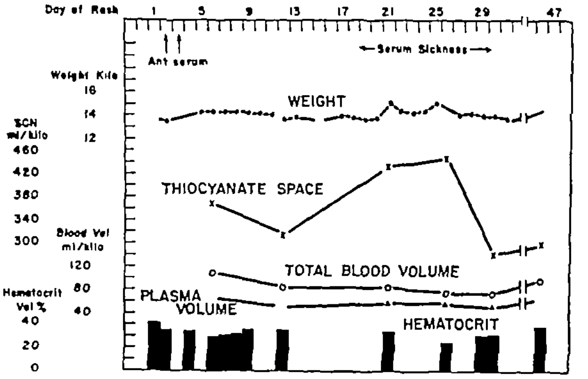

Fig 11 —Alterations in the fluid spaces in a girl 3 yr with moderately severe rickettsial spotted fever treated with specific rabbit antiserum Note the decrease in thiocyanate space on the 11th day as the clinical symptoms began to subside The development of serum sickness on the 18th day after injection of Rocky Mountain spotted fever antiserum reproduced symptoms of infection with fever and edema accompanied by a second rise in the thiocyanate space The symptoms of serum sickness were controlled by the oral administration of diphenhydramine (benadryl®) hydrochloride with return of the thiocyanate space to baseline values

Prolonged serum sickness developed in one of our patients who received penicillin suspended in oil Since the patient was known to have had repeated episodes of stomatitis following the ingestion of peanuts, the sensitivity was thought to be due to the peanut oil used as a menstruum and not to the penicillin Apparently the injection of any material which is allergenic to a particular patient may produce alterations in the permeability of membranes (Fig 14)

COMMENT

Alterations in Capillary Permeability —The observations reported can be interpreted as indicating an increase in the permeability of the vascular tree, permitting the progressive loss of crystalloids, colloids, and red blood cells from the circulation as the magnitude of the capillary defect increased with the clinical severity of the disease The alterations in the vascular tree can be visualized as a series of pores or openings in the capillary wall where the normal extravascular circulation of crystalloids and, to a lesser extent, of small protein molecules is known to occur In mild cases, water and ions which normally traverse the membranes would leave the blood more readily Larger molecules, such as albumin and other proteins, would be lost in severer instances, while red blood cells would pass out of the vascular tree only in the extremest reactions

Alterations in Permeability of Cellular Membranes —The permeability of cell membranes is probably altered too, though no techniques are available for direct measurement of cellular changes Viruses and rickettsiae are obligate intracellular parasites Many bacterial infections—particularly those with a chronic or prolonged course, such as tuberculosis and brucellosis —pass through a phase in which the organisms are found intracellularly During this stage the diffusion of toxemic products of the organism must be through the cell wall, with the attendant danger of damage Furthermore, any immune reaction would take place within the cell, so that substances released in the process would affect primarily the parasitized cells Additional light on the problem of cellular permeability may be shed by experiments now in progress,[15] utilizing the radioactive isotopic dilution technique with Na^{24} and K^{42}

In children acute infections accompanied by diarrhea are reported to produce a potassium deficiency How much of this deficiency is due to a change in the permeability of cellular membranes as a result of the infection itself and how much is due to the disturbances in fluid balance associated with the diarrhea is unknown In either event potassium moves out of the cell in which the membrane of the cell wall normally retains it and is lost in the urine or feces

An analogous situation in which the permeability of cellular membranes is altered in the absence of infection is illustrated by the edema occurring in a young woman with drug intoxication which followed the therapeutic administration of an arsenical preparation (Fig 15) Arsenic apparently poisons intracellular enzyme systems which contain sulfhydryl (SH) groups in the molecule The administration of British anti-lewisite (BAL), a substance which has large numbers of accessible sulfhydryl groups, will rapidly correct the enzymatic defect by combining with the metal With correction of the defect, the alteration in the permeability of membranes is reversed and edema disappears (Fig 16) Observations of this type may give further clues to the mechanism responsible for production of cell defects Such

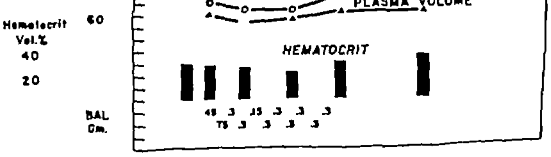

Fig 15 —Fluid changes during arsenic intoxication (treated by inactivation) in a pregnant woman, 39 with early syphilis treated by intravenous injections of oxophenarsine hydrochloride (mapharsen®) The dermatitis appeared after the seventh injection and the patient rapidly became ill Note the decrease in thiocyanate space and weight following the administration of BAL. Clinical photographs of the patient are shown in Figure 16

questions are of more than academic interest, and are important in the design of therapy for acute infections Intracellular enzyme systems are greatly affected by the hydration of cells and by the intracellular concentrations of ions from salts

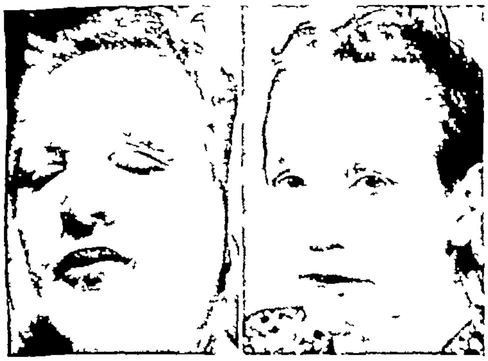

Fig. 16 —Edema and exfoliative dermatitis due to arsenic intoxication in a pregnant woman 39 The photograph on the left was taken on the 27th day of rash two days after the institution of therapy with British anti-lewisite Note the generalized character of the edema and the scaling of dead skin. The photograph on the right was taken three months later showing complete subsidence of signs The patient presented essentially the same appearance two weeks after the institution of therapy illustrating how rapidly changes in permeability may revert with repair of the cellular defect

Therapeutic Possibilities — When infections produce an alteration in the permeability of membranes, treatment with maximum therapeutic doses of effective chemotherapeutic agents should be begun promptly in order to reduce the number of organisms and to prevent further damage In diseases which frequently produce severe alterations in permeability—the rickettsial diseases, for example—every attempt should be made to prevent, in so far as possible, the development of the full-blown clinical picture seen in the natural course of the disease

Salt, dextrose, and water must be administered with care The drop in circulating proteins may be prevented or limited by the administration of a high-protein diet from the beginning of therapy [16] When the patient is seen late in the course of the disease, after the proteins in the blood and tissues have been depleted, or after acute circulatory collapse has developed, preformed proteins in the form of concentrated human serum albumin, plasma, or whole blood must be administered Fluid replacement therapy in specific diseases and under specific circumstances is discussed further in the illustrative cases presented in the section entitled "Alterations in Permeability Associated with Specific Diseases "

The fact that, in patients with serum sickness, administration of antihistaminic drugs relieves the joint pain and swelling and causes the wheals to disappear suggests that these drugs may find a useful place in the treatment of acute infections which have a large element of hypersensitivity Salicylates and the closely related chemical compounds para-aminobenzoic acid (PABA) and procaine have long been successfully employed in the treatment of disease associated with immune reactions

Metabolic factors which affect the permeability of membranes during the course of infections are as yet poorly understood It is not known whether the increase in metabolic rate observed during infections is an attempt by the body to compensate for the defect in permeability by increasing thyroid function It is well recognized, however, that when the thyroid function is lowered, as in myxedema, the membranes become more permeable and fluid is retained in the tissues [15] The salicylates apparently help to correct the defect in permeability in serum sickness, they may, through their antipyretic effect, also depress the increased level of metabolic activity

Many ingenious theories have been proposed concerning the role of the adrenal in acute infections or in diseases which are indirectly related to the stress of illness [17] In instances of adrenal destruction (Waterhouse-Friderichsen syndrome) occurring during meningococcemia, the indications for hormone-replacement therapy are clear The decision to use adrenal cortical hormones must be made on clinical grounds The necessary observations on the pulse, respirations, blood pressure, venous filling and the degree of cyanosis and edema can be made at the bedside with the equipment usually carried in a physician's bag

Corticotrophic hormone (ACTH) or cortisone often will dramatically relieve the symptoms of serum sickness and quickly restore the physiological integrity of the membranes (Fig 14) In patients with pneumonia a reduction in the degree of toxemia and an increase in the sense of well-being following the administration of these hormones have been reported [18] The possible usefulness of these hormones in the treatment of diseases which characteristically are associated with high degrees of allergy, such as tuberculosis, is still under investigation It should be emphasized that the infecting agent is not attacked by the hormones and that they have no effect on bacteremia, if this is present, their action is solely on the tissues of the host The suppression of toxemic reactions in the host may actually be accompanied by an increase in the number of organisms and an exacerbation of the disease [19] This sequence of events has long been recognized by clinicians in the recrudescence of clinical tuberculosis following the termination of pregnancy

The sudden release of large amounts of antigen by the rapid destruction of organisms (such as the Herxheimer reaction which occurs in syphilis after the initial injection of penicillin) or by the dissolution of a granuloma (as occurs in some fungus infections after the administration of iodides) may not prove so detrimental to the patient if the harmful effects of the antigens on sensitized cells can be ameliorated by hormone therapy Conversely, the apparent stimulating effect which hormone therapy has on the growth of the etiological agent may possibly be counteracted by the simultaneous or prior administration of specific chemotherapeutic agents

In the final analysis, however, the patient must still heal himself In spite of the most vigorous and carefully planned therapy, failures will occur Patients will die of the toxemia of overwhelming infections and as the result of extensive vascular or cellular damage However, intelligent management, with attention to alterations in the permeability of membranes, will allow the salvage of many cases now considered hopeless, will lessen the severity of the patient's reaction to his infection, and will shorten convalescence

CONCLUSIONS

Our observations indicate that the permeability of membranes is altered during the course of acute infections Early in the course of the disease the defect is probably induced by the toxemic products of the infecting organisms Later in the course of the illness the defect may result from an immune reaction In rickettsial diseases, for instance, the greatest alteration in permeability appears to come at the time when immunity is rising most rapidly, the balance between the antigens liberated from or secreted by the organisms and the antibody produced by the host is being rapidly destroyed [11] The point at which immunity overcomes the infection and the antibodies begin to appear in excess often is accompanied by a dramatic clinical change which is recognized as a crisis

Antigen-antibody reactions are known to liberate a histamine-like substance That histamine alters the permeability of membranes locally can be readily demonstrated by the intracutaneous injection of a small amount of the material, within a few minutes a wheal appears at the site of injection (Fig 17) Petechial hemorrhages have been recognized for years as a manifestation of anaphylactic reactions, a further clue to the mechanism of production of lesions in infections

Since certain fundamental principles are common to all infectious diseases, alterations in the permeability of membranes can be detected in many infections occurring naturally in human beings or produced experimentally in animals The observations reported indicate that the reactions are qualitatively similar, whether produced by a bacterial infection (meningococcemia), and extracellular infection due to a nematode (trichinosis), an intracellular infection caused by rickettsiae (Rocky Mountain spotted fever), or even an immune reaction occurring in the absence of actual infection (serum sickness)

SUMMARY

The permeability of membranes is altered during the course of acute infections Edema develops during the acute phase, associated with an increase in extravascular fluid (thiocyanate space), and disappears with recovery The alterations may occur within minutes to hours (meningococcemia), within hours to days (pneumococcus pneumonia), or within days to weeks (trichinosis and rickettsial spotted fever) The alterations in permeability which occur during immune reactions in the absence of infection (serum sickness) resemble the changes seen during an acute infectious disease The observations are interpreted as indicating an alteration in the permeability of the capillary wall, permitting the progressive loss of crytalloids (water, ions, and dextrose), colloids (albumin and other proteins), and red blood cells as the clinical severity of the disease increases These changes are often associated with alterations in blood volume and offer an explanation of the mechanism by which peripheral circulatory failure develops The permeability of cell membranes is probably also altered, whether the cells are directly parasitized or not. The alterations during arsenic intoxication, which are reversible by therapy with British anti-lewisite (BAL), offer a clue as to a possible intracellular mechanism through interference with enzyme groups The therapeutic possibilities are discussed, with emphasis on the correct use of crystalloids and proteins and the possible application of antihistamines and hormones in conjunction with specific chemotherapeutic agents in treatment. The early changes are due to toxemic products of the infecting organism, the later changes may result from humoral or cellular immune reactions The alterations in permeability are qualitatively similar, whether produced by a bacterial infection (meningococcemia), an extracellular infection due to a nematode (trichinosis), an intracellular infection caused by rickettsiae (Rocky Mountain spotted fever), or an immune reaction in the absence of infection (serum sickness)

CLINICAL NOTES

TUBERCULOSIS FOLLOWING CORTISONE THERAPY

REPORT OF A CASE OF RAPIDLY PROGRESSIVE PULMONARY TUBERCULOSIS FOLLOWING CORTISONE THERAPY FOR RHEUMATOID ARTHRITIS

Ernest Q King, M D
John B Johnson, M D ,
Gilbert S Batten, M D
and
Walter Lester Henry, M D , Washington, D C

Experts in the field of tuberculosis have expressed concern that in some cases prolonged use of cortisone or corticotrophin (ACTH) may cause a lowering of a patient's resistance against tuberculosis As a result the National Tuberculosis Association recently published the following recommendation [1]

> Because the action of ACTH and cortisone upon factors of resistance to tuberculosis has been shown to be deleterious in at least three species of experimental animals (mice, guinea pigs, and rabbits), and there is strongly suggestive evidence along the same lines in human beings, it is recommended that these substances not be used in patients with active tuberculosis, and that

[1] Bull Nat Tuberc A 37:4 (Jan) 1951

they be used with extreme caution even in human beings with possibly latent tuberculosis infection, until such time as further investigative work has shown that such administration may be safe The routine diagnostic examination for tuberculosis of patients under physicians care is especially necessary for patients who are being considered for ACTH or cortisone therapy

Among the animal studies referred to in the above statement are those by Spain and Molomut[2] and Cummings[3] Freeman[4] reported a spread in one of two tuberculous patients under treatment with ACTH Bogan[5] and others have observed similar effects following cortisone therapy, but were not positive whether the effects owing to the drug or to the disease process itself

In view of these observations, we are presenting the following case which, based on clinical and roentgenologic findings, has been interpreted as the development of rapidly progressive pulmonary tuberculosis following cortisone therapy in a patient with rheumatoid arthritis, in whom there was no roentgenologic evidence of active or latent pulmonary tuberculosis when cortisone therapy was initiated, or during a period of 17 years prior to treatment

REPORT OF A CASE

R A, a woman aged 39, single, had been under medical observation for a period of over 17 years During her early twenties she had been frail and had shown easy fatigability Although not considered in good health, she was able to complete her education and follow her occupation Numerous x ray studies of her chest made during the past 17 years did not reveal any lesions which were interpreted as active or latent tuberculosis

In 1947, the patient first began to have joint manifestations starting in the ankles, consisting of pain, stiffness, and swelling Later, the knees wrists, and the joints of the hands became similarly involved In 1948, she was hospitalized because of pneumonitis, complicated with anemia, fever, and joint involvement Because of a failure to respond to penicillin, she received streptomycin for a short time A rash soon developed over the face, which was followed immediately by a generalized skin eruption over the body This episode was considered to represent a sensitivity reaction The rash disappeared soon after streptomycin was discontinued During this first hospitalization, laboratory data revealed evidence of a microcytic anemia and impairment of liver function as determined by the cephalin cholesterol liver function test Several roentgenologic examinations of the chest were made during this period These showed transient enlargement of the cardiac silhouette suggesting pericardial effusion After several months hospitalization, the patient was discharged, improved

About one year later, January 1950, the patient was again hospitalized complaining of weakness periodic numbness and tingling of the fingers, and pain, swelling, and stiffness of the joints of the wrists, hands shoulders, knees, and ankles A diagnosis of disseminated lupus erythematosus was entertained but biopsy of the skin and muscle failed to confirm this impression The arthritis was regarded as the rheumatoid type The patient was discharged after two months hospitalization, slightly improved

By May, 1950 the rheumatoid arthritis had become so severe as to incapacitate the patient completely The joint pain and stiffness were of such severity that she could not turn over in bed or get out of bed unassisted There was no x ray evidence of ankylosis At this time she was hospitalized for cortisone therapy

On May 11, 1950 the laboratory findings included a red blood cell count of 3 990 000 per cubic millimeter a hemoglobin value of 76% a hematocrit value of 34%, an erythrocyte sedimentation rate of 65%, a white blood cell count of 10,400, with a differential count of neutrophils 65% lymphocytes 34% basophils, 1%, with 1% reticulocytosis The urinalysis findings at that time were entirely normal On May 10, 1950, nonprotein nitrogen was 22 mg per 100 cc total protein 6 96 gm per 100 cc with 2 35 gm albumin and 4 61 gm globulin The x ray of the chest three months prior to the institution of cortisone therapy revealed that there was no significant tuberculous lesion (Fig. 1)

The patient was started on cortisone on May 12, 1950 and a total of 800 mg of cortisone was given by intramuscular injection during the first four days (Table contains complete dosage schedule) Within three hours after cortisone was started, the patient showed marked clinical improvement She had less pain and could move about in bed freely Within 48 hours the patient was able to arise from bed unassisted and was able literally to run slowly in the hospital corridors The patient was discharged from the hospital on May 17, 1950, much improved Cortisone treatment was continued on an outpatient basis with the objective of finding the minimum dosage which would give the maximum relief of symptoms

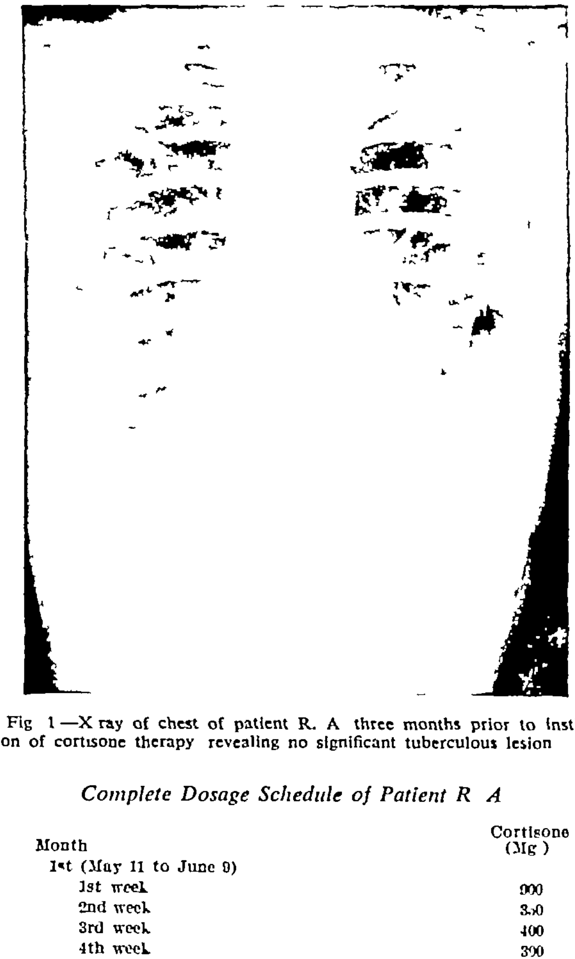

Fig 1—X ray of chest of patient R. A three months prior to institution of cortisone therapy revealing no significant tuberculous lesion

Complete Dosage Schedule of Patient R A

Month	Cortisone (Mg)
1st (May 11 to June 9)	
1st week	900
2nd week	350
3rd week	400
4th week	300
2nd (June 10 to July 10)	1,200
3rd (July 10 to Aug 11)	1 200
4th (Aug 12 to Sept 5)	900
5th and 6th (Sept 6 to Nov 10)	0
7th (Nov 11 to Dec 1)	1 400

At the time of discharge from the hospital, the patient had experienced no change in blood pressure change in heart size rounding of the face, or any other adverse signs of therapy

3 Cummings M M Influence of Cortisone on Experimental Tuberculosis in Transactions of the 10th Veterans Administration Conference on Chemotherapy of Tuberculosis Jan 25 1951 to be published

4 Freeman S Fershing J Wang C C and Smith L. C Effect of *ACTH* on *Patients* with Pulmonary Tuberculosis in Mote J R Clinical ACTH Conference Proceedings of First Conference Philadelphia, The Blakiston Company 1950 p 509

5 Bogan, Emil Adrenocortrophic and Adrenocorticogenic Hormones in Tuberculosis in Transactions of the 10th Veterans Administration Conference on Chemotherapy of Tuberculosis Jan 25 1951 to be published

In August, 1950, during therapy with cortisone, she experienced an episode of pain in the right hip, diagnosed as probable bursitis This pain did not yield to cortisone therapy, but required adjunct therapy with procaine injections and x ray therapy

After mid-September, 1950, the patient felt so well that cortisone and other therapy was discontinued She was *sufficiently* improved so that she was able to return to her usual occupation

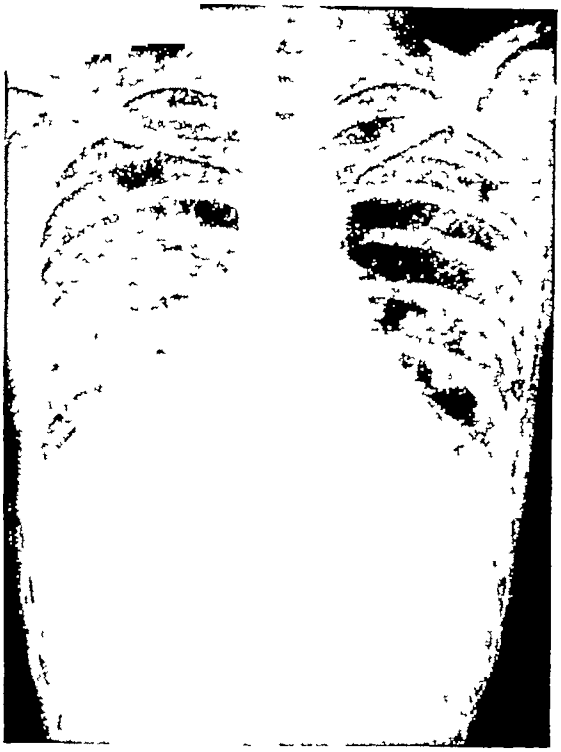

Fig 2.—X ray of chest of patient R A taken Nov 27 1950 showing a lesion that is characteristic of aspiration pneumonitis and in all probability tuberculosis

During the second week in November the arthritic pains recurred with such severity as to require cortisone therapy to be resumed At this time she was placed on oral cortisone, 25 mg daily On Nov 20, 1950 the dose was increased to 100 mg daily for nine days This dosage was maintained until Dec 1 1950 after which no further cortisone was given At this time hospitalization was advised because of facial edema hyperpnea, tachycardia, and x-ray evidence of pneumonitis at the right lung base However, the patient refused hospitalization

The roentgenologic findings on Nov 27 1950 revealed that there was in the right lung a largely hemogenous dense infiltration below the fifth posterior rib There were, however numerous rounded rarefactions approximating 8 cm in diameter In the left lung there was a scanty infiltration composed of faint spots The comment of the expert in the field of tuberculosis who interpreted the film was that the lesion is characteristic of aspiration pneumonitis and, in all probability, tuberculous The extension of the apical infiltration showing faintly in the left on the original films contributes to this impression (Fig 2)

On Jan 4, 1951 the patient entered the hospital critically ill She was febrile and extremely dyspneic, and her joints were exquisitely painful She had a weak, nonproductive cough The x ray at this time was interpreted by experts in the fields of roentgenology and tuberculosis (Fig 3) The right lung was completely occupied with infiltrations of greater density than in the film of November, with numerous punched out factions The left lung revealed extension of the infiltration with a rarefaction of 1 cm in the circle of the first rib Scanty infiltration was scattered through the rest of the lung From a roentgenologic standpoint this case was considered as being acute caseous tuberculosis of the type seen in the aged terminal uremics, diabetics, or in the very young Based on the combined roentgenologic and clinical findings, the diagnosis was that of a fulminating tuberculous pneumonia The patient s course was rapidly downhill, and she died on Jan 8, 1951 Request for autopsy was denied

COMMENT

It is realized that a confirmed diagnosis of tuberculosis was not made in this patient, since tubercle bacilli were not found while the patient was living, nor was an autopsy performed However, based on careful clinical and roentgenologic findings, the diagnosis was that this patient died from a rapidly progressive tuberculosis The case is reported primarily to emphasize that extreme care should be taken in ruling out active or latent tuberculosis prior to the institution of prolonged cortisone or ACTH therapy until further studies are made to determine whether these drugs may or may not have an *adverse effect in the spread of the disease*

In this case, the cortisone apparently had a deleterious effect on old, seemingly insignificant, tuberculous focuses in the patient's lung fields It has been reported [6] that in many infectious diseases the organisms continue to grow despite the administration of cortisone, though the patient feels better and in many cases eventually overcomes his infection When cortisone is given to tuberculous animals, a remarkable lack of limitation of spread of tuberculous processes is seen Fibroplasia is inhibited and freedom of movement through the tissues by the tubercle bacilli is facilitated

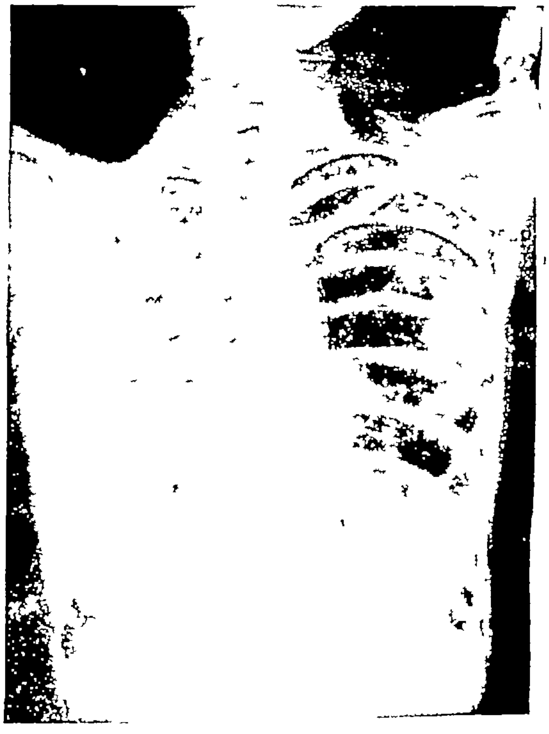

Fig 3—X ray of chest of patient R A taken Jan 4 1951 showing spread with x ray diagnosis of acute caseous tuberculosis

Presumably there was a spread of tubercle bacilli throughout this patient's lungs that was initiated by cortisone therapy Her generalized debilitated condition was a further factor in its rapid spread Interference with macrophage activity and depletion of lymphoid tissue by prolonged cortisone administration were most likely additional contributory deleterious factors

[6] Kass E. H Ingbar S H and Finland M Effects of Adrenocorticotropic Hormone in Pneumonia Clinical Bacteriological and Serological Studies Ann Int. Med 33 1081 (Nov) 1950 Hench P Effects of Cortisone in Rheumatic Diseases Lancet 2 483 (Oct 21) 1950

X-ray studies have been conducted on a large group of patients who have received cortisone over prolonged periods In these patients, no instances of pulmonary complications have been encountered

It is recommended that all patients who are to undergo prolonged therapy with cortisone be carefully studied prior to and during treatment to determine whether a latent or active tuberculosis exists or develops

CORTISONE AND PULMONARY TUBERCULOSIS

Carol G Popp , M D
Poul Ottosen, M D
and
Charles A Brasher, M D , Mount Vernon, Mo

A warning against the use of corticotrophin (ACTH) and cortisone not only in patients with active tuberculosis but also in patients with latent tuberculous infection was issued a few months ago by the Committee on Medical Research of the American Trudeau Society, in the Bulletin of the National Tuberculosis Association[1] In a subsequent issue of the Bulletin, Tucker[2] again emphasized the danger of the use of ACTH and cortisone in the tuberculous patient

Spain and Molomut[3] described the effect of cortisone in guinea pigs experimentally infected with tuberculosis The lesions in those animals receiving cortisone appeared to be more extensive and less well localized than in control animals that did not receive cortisone

In an editorial in THE JOURNAL, March 24, 1951,[4] the suggestion is issued that caution should be exercised in the administration of cortisone to patients with tuberculosis This suggestion is made as a result of tests on tuberculous animals

To our knowledge, no report has been made, until the present time, about the ill effect cortisone may have on human beings who are infected with pulmonary tuberculosis We therefore feel that the following case report may be of interest to the medical profession

REPORT OF A CASE

A G a white woman aged 64, was admitted for the second time to the Missouri State Sanatorium on June 21 1950, because of far advanced bilateral tuberculosis with doubtful activity

The patient was first admitted to the Missouri State Sanatorium March 1, 1947 with a far advanced case of active pulmonary tuberculosis Figure 1 shows the first x ray taken at the time of her first admission

She gave a history of gradual onset of her disease with cough chest pain low grade temperature, and gradual loss of weight of about two years duration

In April, 1935 she was a patient at the Mayo Clinic Rochester Minn and a diagnosis of rheumatoid arthritis and bronchial asthma was made X rays of the chest were negative at that time

During her first admission she had 21 sputum examinations for tubercle bacilli All were negative on direct smear Guinea pig inoculation and culture were both negative for acid fast organisms Tuberculin skin tests were positive on old tuberculin dilution 0 005 Other tests made gave no further information A diagnosis of pulmonary tuberculosis was made at that time entirely from chest x-rays, evidence of positive skin test, and from clinical history

Fig. 1 —First x ray of patient A G taken at the time of her first admission to the Missouri State Sanatorium March 1 1947

On her first admission to the Missouri State Sanatorium she also showed evidence of marked rheumatoid arthritis and secondary anemia

During this first admission the patient had no other treatment than bed rest and symptomatic treatment for arthritis She was discharged Nov 28, 1948 At discharge the patient s tuberculosis was considered as arrested

On June 21, 1950 the patient was readmitted because of an increase in cough and expectoration

Figure 2 shows the chest x ray made at the time of readmission It is noted that there was no change in the x ray appearance since her first admission

The readmission diagnosis was far advanced pulmonary tuberculosis with doubtful activity, and chronic rheumatoid arthritis with secondary anemia Laboratory findings showed 11 sputum examinations to be negative for acid fast bacilli tuberculin skin test positive, purified protein derivative (tuberculin) dilution 0 0001 red blood cell count 3,800,000 hemoglobin, 71%, white blood cell count 3,100, sedimentation rate (Cutler method) 31 urine normal Kahn test negative

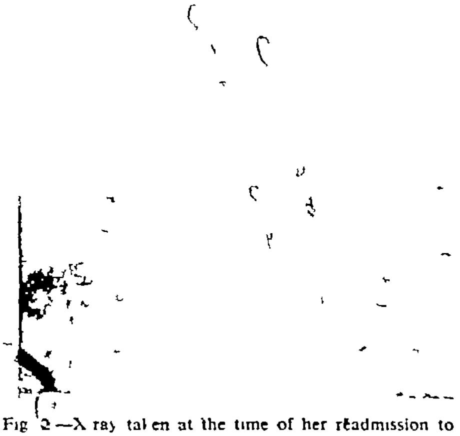

Fig 2 —X ray taken at the time of her readmission to the Sanatorium June 21 1950

From the Medical Department of the Missouri State Sanatorium Mount Vernon Mo resident physician (Drs Popp and Ottosen) and Superintendent (Dr Brasher)

After mid September, 1950, the patient felt so well that cortisone and other therapy was discontinued She was sufficiently improved so that she was able to return to her usual occupation

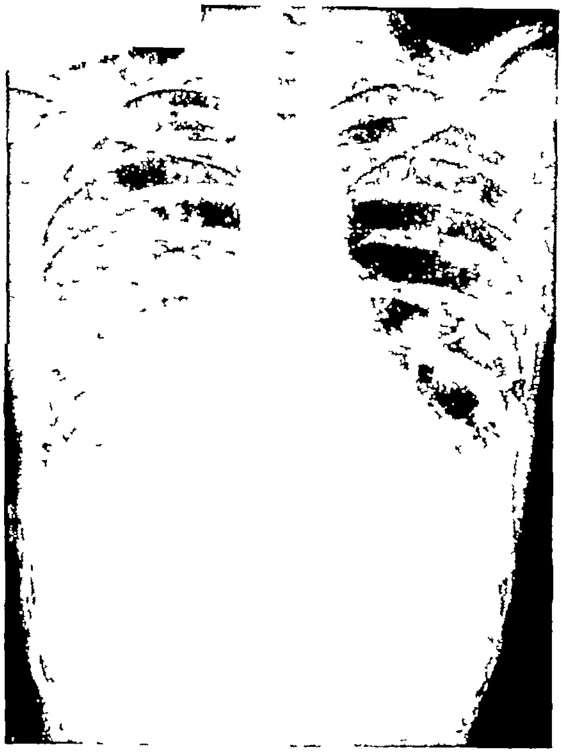

Fig 2.—X ray of chest of patient R A taken Nov 27 1950 showing a lesion that is characteristic of aspiration pneumonitis and in all probability tuberculosis

During the second week in November the arthritic pains recurred with such severity as to require cortisone therapy to be resumed At this time she was placed on oral cortisone 25 mg daily On Nov 20, 1950 the dose was increased to 100 mg daily for nine days This dosage was maintained until Dec 1 1950, after which no further cortisone was given At this time hospitalization was advised because of facial edema hyperpnea, tachycardia and x-ray evidence of pneumonitis at the right lung base However the patient refused hospitalization

The roentgenologic findings on Nov 27 1950, revealed that there was in the right lung a largely hemogenous dense infiltration below the fifth posterior rib There were however numerous rounded rarefactions approximating 8 cm in diameter In the left lung there was a scanty infiltration composed of faint spots The comment of the expert in the field of tuberculosis who interpreted the film was that the lesion is characteristic of aspiration pneumonitis and, in all probability, tuberculous The extension of the apical infiltration showing faintly in the left on the original films contributes to this impression (Fig 2)

On Jan 4, 1951, the patient entered the hospital critically ill She was febrile and extremely dyspneic and her joints were exquisitely painful She had a weak nonproductive cough The x-ray at this time was interpreted by experts in the fields of roentgenology and tuberculosis (Fig 3) The right lung was completely occupied with infiltrations of greater density than in the film of November, with numerous punched out factions The left lung revealed extension of the infiltration with a rarefaction of 1 cm in the circle of the first rib Scanty infiltration was scattered through the rest of the lung From a roentgenologic standpoint this case was considered as being acute caseous tuberculosis of the type seen in the aged terminal uremics, diabetics, or in the very young Based on the combined roentgenologic and clinical findings, the diagnosis was that of a fulminating tuberculous pneumonia The patient s course was rapidly downhill, and she died on Jan 8, 1951 Request for autopsy was denied

COMMENT

It is realized that a confirmed diagnosis of tuberculosis was not made in this patient, since tubercle bacilli were not found while the patient was living, nor was an autopsy performed However, based on careful clinical and roentgenologic findings, the diagnosis was that this patient died from a rapidly progressive tuberculosis The case is reported primarily to emphasize that extreme care should be taken in ruling out active or latent tuberculosis prior to the institution of prolonged cortisone or ACTH therapy until further studies are made to determine whether these drugs may or may not have an adverse effect in the spread of the disease

In this case, the cortisone apparently had a deleterious effect on old, seemingly insignificant, tuberculous focuses in the patient's lung fields It has been reported [6] that in many infectious diseases the organisms continue to grow despite the administration of cortisone, though the patient feels better and in many cases eventually overcomes his infection When cortisone is given to tuberculous animals, a remarkable lack of limitation of spread of tuberculous processes is seen Fibroplasia is inhibited and freedom of movement through the tissues by the tubercle bacilli is facilitated

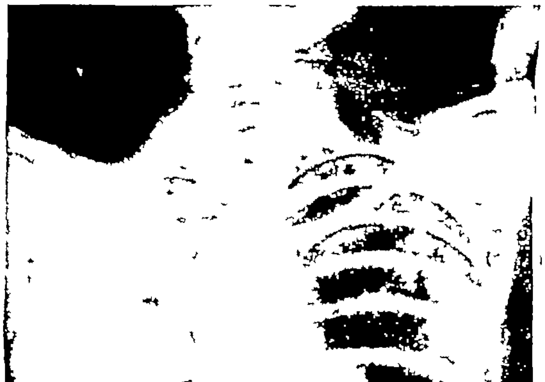

Fig 3 —X ray of chest of patient R A taken Jan 4 1951 showing spread with x ray diagnosis of acute caseous tuberculosis.

Presumably there was a spread of tubercle bacilli throughout this patient's lungs that was initiated by cortisone therapy Her generalized debilitated condition was a further factor in its rapid spread Interference with macrophage activity and depletion of lymphoid tissue by prolonged cortisone administration were most likely additional contributory deleterious factors

X-ray studies have been conducted on a large group of patients who have received cortisone over prolonged periods In these patients, no instances of pulmonary complications have been encountered

It is recommended that all patients who are to undergo prolonged therapy with cortisone be carefully studied prior to and during treatment to determine whether a latent or active tuberculosis exists or develops

CORTISONE AND PULMONARY TUBERCULOSIS

Carol G Popp, M D
Poul Ottosen, M D
and
Charles A Brasher, M D, Mount Vernon, Mo

A warning against the use of corticotrophin (ACTH) and cortisone not only in patients with active tuberculosis but also in patients with latent tuberculous infection was issued a few months ago by the Committee on Medical Research of the American Trudeau Society, in the Bulletin of the National Tuberculosis Association [1] In a subsequent issue of the Bulletin, Tucker [2] again emphasized the danger of the use of ACTH and cortisone in the tuberculous patient

Spain and Molomut [3] described the effect of cortisone in guinea pigs experimentally infected with tuberculosis The lesions in those animals receiving cortisone appeared to be more extensive and less well localized than in control animals that did not receive cortisone

In an editorial in THE JOURNAL, March 24, 1951,[4] the suggestion is issued that caution should be exercised in the administration of cortisone to patients with tuberculosis This suggestion is made as a result of tests on tuberculous animals

To our knowledge, no report has been made, until the present time, about the ill effect cortisone may have on human beings who are infected with pulmonary tuberculosis We therefore feel that the following case report may be of interest to the medical profession

REPORT OF A CASE

A G, a white woman aged 64 was admitted for the second time to the Missouri State Sanatorium on June 21 1950 because of far advanced bilateral tuberculosis with doubtful activity

The patient was first admitted to the Missouri State Sanatorium March 1 1947 with a far advanced case of active pulmonary tuberculosis Figure 1 shows the first x ray taken at the time of her first admission

She gave a history of gradual onset of her disease with cough, chest pain low grade temperature, and gradual loss of weight of about two years duration

In April 1935 she was a patient at the Mayo Clinic Rochester Minn and a diagnosis of rheumatoid arthritis and bronchial asthma was made X-rays of the chest were negative at that time

During her first admission she had 21 sputum examinations for tubercle bacilli All were negative on direct smear Guinea pig inoculation and culture were both negative for acid fast organisms Tuberculin skin tests were positive on old tuberculin, dilution 0 005 Other tests made gave no further information A diagnosis of pulmonary tuberculosis was made at that time entirely from chest x rays, evidence of positive skin test, and from clinical history

Fig. 1 —First x ray of patient A G taken at the time of her first admission to the Missouri State Sanatorium March 1 1947

On her first admission to the Missouri State Sanatorium she also showed evidence of marked rheumatoid arthritis and secondary anemia

During this first admission the patient had no other treatment than bed rest and symptomatic treatment for arthritis She was discharged Nov 28, 1948 At discharge the patient s tuberculosis was considered as arrested

On June 21, 1950 the patient was readmitted because of an increase in cough and expectoration

Figure 2 shows the chest x ray made at the time of readmission It is noted that there was no change in the x ray appearance since her first admission

The readmission diagnosis was far advanced pulmonary tuberculosis with doubtful activity, and chronic rheumatoid arthritis with secondary anemia Laboratory findings showed 11 sputum examinations to be negative for acid fast bacilli, tuberculin skin test positive, purified protein derivative (tuberculin) dilution 0 0001 red blood cell count 3,800,000, hemoglobin, 71%, white blood cell count 3,100 sedimentation rate (Cutler method) 31, urine normal Kahn test negative

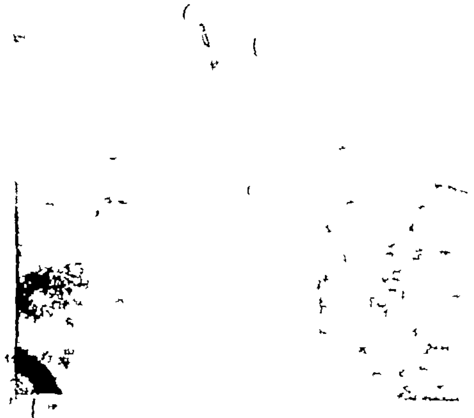

Fig 2.—X ray taken at the time of her readmission to the Sanatorium June 21 1950

[4] Cortisone in Tuberculosis Editorial J A M A 145 907 (March 24) 1951

For her pulmonary tuberculosis, bed rest was advised

Because of severe pains in her joints treatment with cortisone was started on Aug 10, 1950 Dosage was as follows 100 mg every eight hours the first day, 100 mg every 12 hr the second day, 100 mg the third day and thereafter On Aug 23, 1950, cortisone was reduced to 100 mg every 48 hr until a total of 2 500 mg was given During this course of cortisone from Aug 10, 1950, to Sept 8, 1950, the patient s pulmonary condition showed no definite changes, as observed by fluoroscopy and clinical observation Unfortunately, no chest x-ray was taken during this period because the patient did not show any symptoms of progression of her pulmonary lesion, nor did we have any knowledge, at that time, that cortisone could produce a re activation of pulmonary tuberculosis Clinically, the arthritis improved considerably, and the pain subsided almost completely after the third day of treatment The anemia also improved, the erythrocyte count increasing to 4,400,000, and hemoglobin to 80% Blood sugar and blood pressure remained within normal limits

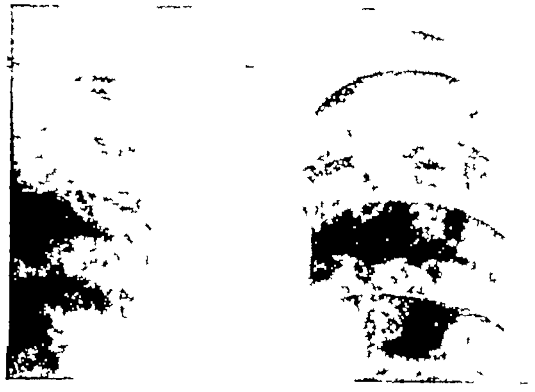

Fig 3 —X ray taken on Oct 27 1950 showing cavity formation in the subapical region of the left lung

Three weeks after the first course was discontinued, severe rheumatic symptoms again developed in the patient and a new course of cortisone was started on Sept 27, 1950, the dosage being the same as in the previous course In this second course the patient received a total of 1 500 mg of cortisone Again the patient s rheumatic condition improved rapidly, and her physical condition was satisfactory

On Oct 14, 1950, the patient had a moderate hemoptysis of about 6 to 8 ounces (0 18 to 0 24 L) She was put on strict bed rest, and cortisone was discontinued On Oct 27, 1950, a chest x ray was made, which showed cavity formation in the subapical region of the left lung (Fig 3) At the same time the patient had sputum examinations which were positive for acid-fast bacilli on direct smear This was the first time in the patient's four to-five year history of pulmonary tuberculosis that tubercle bacilli were found in her sputum

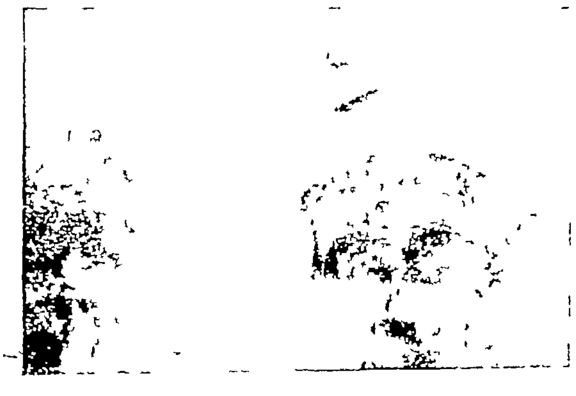

Fig 4 —X ray taken Jan 27 1951 showing marked improvement of the lesion in the left lung, with almost complete closure of the subapical cavity

Streptomycin, 1 gm daily, and para aminosalicylic acid (PAS) 8 gm daily, were started on Oct 27, 1950 There was no recurrence of hemoptysis

An x-ray taken Jan 27, 1951, showed marked improvement of the lesion in the left lung with almost complete closure of the subapical cavity (Fig 4)

At the present the patient is still in the Sanatorium A recent series of sputum examinations were negative for acid fast bacilli Her general condition and clinical findings referable to the chest are not suggestive of activity of her pulmonary tuberculosis

COMMENT

The case reported suggests that an apparently arrested case of pulmonary tuberculosis has been activated by administering cortisone for arthritis We feel justified in arriving at this conclusion because we have been unable to detect any other reasons for the reactivation, and the patient had no symptoms indicating activity of her pulmonary condition during the two-to-three-month period of observation prior to the administration of cortisone

SUMMARY

A case of a 64-year-old white woman with pulmonary tuberculosis that was activated after receiving a total of 4,000 mg of cortisone is reported

DEVELOPMENT OF ACTIVE PULMONARY TUBERCULOSIS DURING ACTH AND CORTISONE THERAPY

Leo Fred, M D , Melvin H Levin, M D ,
J Bernard Rivo, M D
and
Thomas F Barrett, M D , Los Angeles

Of a group of patients with rheumatoid arthritis who had been receiving corticotrophin (ACTH) and/or cortisone in our arthritis clinic, clinical manifestations of active tuberculosis developed in one

Because of the possibility that the appearance of fulminating clinical tuberculosis in this patient and the administration of the aforementioned widely used hormones were related rather than coincidental events, we consider it advisable to publicize this case history in detail

REPORT OF A CASE

A white man aged 58 whose rheumatoid arthritis first became evident in January, 1949 was first admitted to Wadsworth Hospital in July, 1949 because of hepatitis His arthritis was noted to improve markedly while he was jaundiced, but recurred with the subsidence of the hepatitis A liver biopsy at that time was interpreted as demonstrating cirrhosis and superimposed hepatitis He was discharged in October, 1949, and got along well until May, 1950, when he had a generalized exacerbation of his arthritis for which he was given combined vitamin C and desoxycorticosterone acetate by his private physician which resulted in a marked aggravation of his symptoms with no objective changes During May and June, 1950, he noted a low grade fever and anorexia and a 20 lb (9 kg) weight loss and therefore was admitted to Wadsworth Hospital again on June 20 1950

His family history is not significant Previous to his present ailments, he had been well

---

From the Medical Service Wadsworth Hospital Veterans Administration Center Los Angeles and the Department of Medicine University of California at Los Angeles

Sponsored by the Veterans Administration and published with the approval of the Chief Medical Director The statements and conclusions of the authors are the result of their own study and do not necessarily reflect the opinion or policy of the Veterans Administration

Physical examination revealed a thin, poorly nourished white man who moved carefully and slowly with obvious pain on motion His blood pressure was 110/70 his pulse was regular, and the rate was 70 beats per minute His temperature was 100 2 F There was limitation of motion of his neck and all peripheral joints with increased heat, swelling, and tenderness of his proximal phalangeal, metacarpophalangeal, and ankle joints bilaterally His liver edge was felt 4 fingerbreadths below the right costal margin and was nontender and smooth Epitrochlear and axillary glands were palpable There was a subcutaneous nodule on the right upper arm Several spider angiomas were noted over his upper thorax His axillary and pubic hair was sparse The rest of his examination was considered to be within normal limits A roentgenogram of the thorax showed nothing significant (Fig 1) Roentgenograms of the involved extremities revealed soft tissue swelling but no gross bone changes except for generalized osteoporosis The erythrocyte count was 4,450 000 with a hemoglobin value of 86% The leukocyte count was 9 500, with 54% polymorphonuclear leukocytes, 36% lymphocytes, 5% monocytes, and 5% eosinophiles The specific gravity of his urine was 1 023 with no abnormal constituents The Kahn test was negative The sedimentation rate (Wintrobe) was 22 mm per hour Blood urea nitrogen was 8 mg per 100 cc and serum uric acid was 2 3 mg per 100 cc The sulfobromophthalein test showed 8% retention in 45 minutes, thymol turbidity 17 units, and thymol flocculation 4+ Total serum proteins were 6 gm with albumin 3 1 gm and globulin 2 9 gm Ketosteroids in urine specimens taken over a 24-hour period varied from 3 1 to 6 7 mg

Because of daily temperature elevations varying between 100 and 101 F with no new abnormal physical signs, urine cultures and blood cultures were done with no growth demonstrated in any A muscle biopsy revealed nothing significant, and a lymph node biopsy was reported as demonstrating nonspecific lymphadenitis The subcutaneous nodule on his right arm was also subjected to biopsy and showed the typical changes of a rheumatoid nodule A sternal marrow examination revealed a normal dispersion of marrow elements, and culture of the marrow was negative Agglutination tests for typhoid, paratyphoid, and brucellosis were also negative

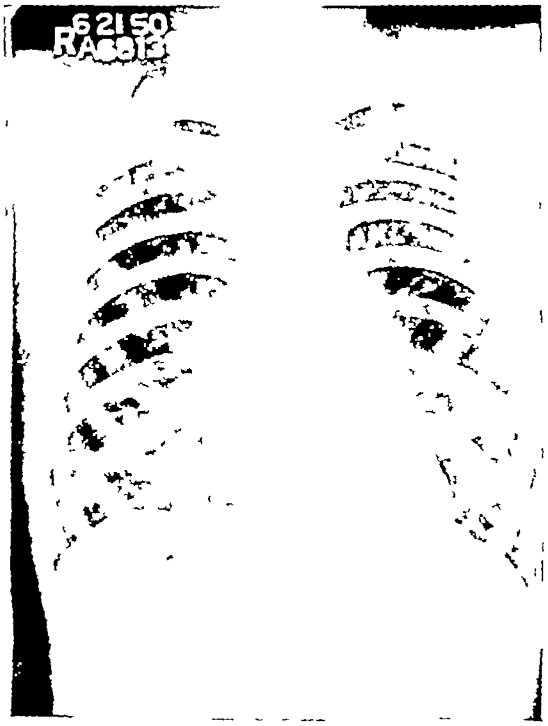

Fig 1 —Chest roentgenogram of patient in case report taken 10 weeks before hormone therapy

The patient was considered to have active rheumatoid arthritis and chronic hepatitis with fibrosis Since no other cause could be found for his fever, it was considered to be a manifestation of his rheumatoid disease, and treatment in this direction was instituted He was given Δ⁵ pregnenolone, 300 mg daily, for two weeks with no subjective or objective improvement Pregnenolone was then discontinued, and he was kept on acetylsalicylic acid, a high protein high caloric diet, and paraffin baths for his affected extremities There was mild improvement of his arthritis on this regimen, although his joints were still warm, swollen and tender He had no fever during this period On Sept 1, 1950 because of a slight nonproductive cough with no new physical signs on examination, a chest x ray was taken (Fig 2) which again revealed no abnormality On this date, he was started on ACTH 20 mg four times a day and this was decreased to 15 mg four times a day on Sept 20 1950 On Oct 3 1950, his temperature was 98 8 F, there was no objective evidence of arthritis discernible, he had gained 18 lb (8 kg) the sedimentation rate (Wintrobe) was 6 mm per hour, the white blood count was 11,000 with a normal differential and he felt very well On Oct 11, 1950, his temperature suddenly rose to 102 4 F accompanied with a marked generalized exacerbation of his arthritis, a sedimentation rate (Wintrobe) of 32 mm per hour and a leukocyte count of 13 800, with 65% polymorphonuclear leukocytes 30% lymphocytes, 3% monocytes, and 2% eosinophiles At this time 100 mg of cortisone was added to his 60 mg of ACTH daily, after which he became afebrile and his arthritis improved again However, on Oct 20 1950 his temperature again rose, this time to 104 F, his cough increased and became productive and his arthritis became worse ACTH was discontinued on this date, but he continued to receive 150 mg of cortisone daily On Oct 31, 1950 an x-ray of his chest revealed an extensive inflammatory process in his right upper lobe (Fig 3) He was considered to have pneumonia and he was started on procaine penicillin (crysticillin®) and aureomycin His sputum, examined prior to antibiotic therapy contained a mixed type of flora with no predominating organism and was not purulent Two sputa concentrates were negative for acid fast bacilli on Nov 1, 1950 Blood cultures were negative The spiking temperature continued On Nov 3, 1950, many colonies of Klebsiella type B were reported in his sputum and therefore his therapy was changed to streptomycin and sulfadiazine Blood cultures remained negative He continued his febrile course but did not appear or feel as ill as one would have expected considering

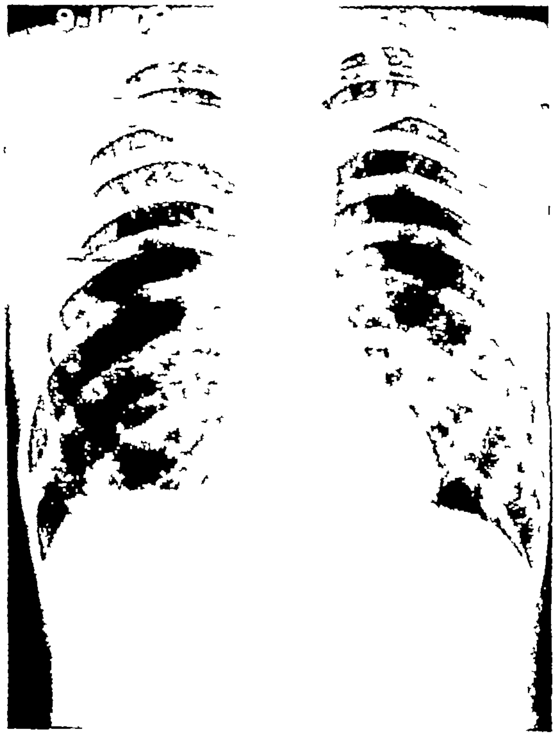

Fig 2 —Chest roentgenogram taken the day hormone treatment began

the signs On Nov 8, 1950, cortisone was discontinued because it was felt that it might be adversely affecting his lung infection X-rays revealed continuing extension of his pulmonary lesion On Nov 15, 1950, streptomycin and sulfadiazine were discontinued and the patient was started on intravenous aureomycin

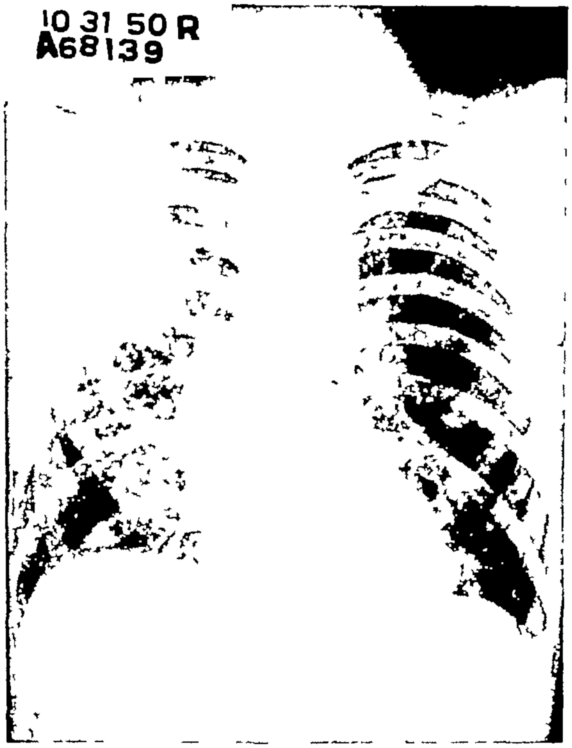

Fig 3 —Chest roentgenogram depicting the findings immediately before hormone therapy was stopped

After the cortisone was discontinued, his course seemed to go downhill quickly and he appeared depressed and complained of increasing weakness and anorexia On Nov 16, 1950, his sputum was found to be loaded with acid fast bacilli, but no Klebsiella organisms and he was transferred to our Tuberculosis Section Chest x ray on Dec 28, 1950 (Fig 4) revealed early multiple cavitation Recent sputum examinations have continued to show many acid fast bacilli He is now receiving streptomycin and para aminosalicylic acid (PAS) with poor response thus far

COMMENT

This patient, while receiving ACTH and cortisone, suddenly manifested clinical evidence of active pulmonary tuberculosis His chest x-ray on Sept 1, 1950, even on retrospective examination, revealed no abnormality, but a chest x-ray six weeks later showed extensive lung involvement which proved to be tuberculosis

It is possible that this sequence of events had no relation to the administration of the hormones He may have had latent tuberculosis (there is a Ghon focus in the left lower lung field) which became clinically active for unknown reasons, or he may have been reinfected during the time he spent next to a patient with tracheobronchial tuberculosis,[1] resulting in an acute fulminating type of tuberculous pneumonia which is prone to occur in patients already harboring chronic disease such as cirrhosis

On the other hand, he was receiving hormones which, we are beginning to realize, may, among other effects, exert a powerful influence on the physiological reactions of the body to insult [2] Present evidence suggests that these hormones, through some as yet unknown mechanism, have the ability to temporarily depress inflammatory response to injury, regardless of etiology [3] This "antiphlogistic action," as Dougherty and Schneebeli call it,[4] probably explains the ameliorative effects of the hormones on the so-called collagen diseases, a group of disorders in which mesenchymal tissue hyper-reactivity, possibly secondary to noxious antibody stimulation [3] or other phlogogenic stimulus, is the main incapacitating element (The release of this temporary depression of inflammatory reaction, which occurs when the hormones are discontinued, has in animals been followed by a *rebound* sensitized-tissue reaction more intense and destructive than the control sensitized-tissue response [5] We think we have also observed this rebound phenomenon in man, and we expect to report our observations in detail at a later date For example, after stopping the administration of ACTH or cortisone, in several of our patients a much severer grade of arthritis than they originally had flared up, and in one patient with rheumatoid arthritis who died six weeks after discontinuance of the hormones autopsy showed early fulminating disseminated periarteritis nodosa lesions which did not appear to be more than several weeks old It therefore appears to us that the possibility of initiating or aggravat-

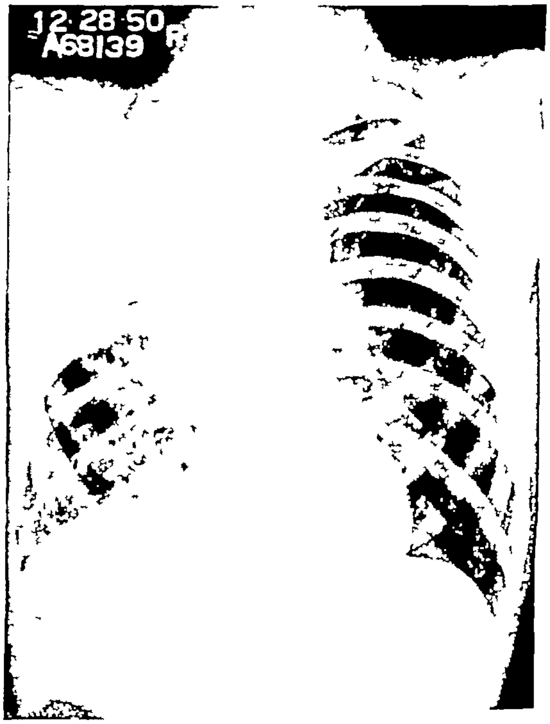

Fig. 4 —Chest roentgenogram showing the rapid progression of tuberculosis eight weeks later

ing human tissue hyperreactivity disorders with these hormones is one that deserves serious consideration)

---

[1] In August 1950, this patient was in bed for one week next to a patient who was diagnosed later as having tracheobronchial tuberculosis.

[2] Other effects noted while the patient was receiving the hormones were edema (relieved by 80 mg sodium diet and parenteral mercurial diuretics) moon face, diabetic glucose tolerance curve mild euphoria wound separation and delayed healing of biopsy sites.

[4] Dougherty T F and Schneebeli G L. Role of Cortisone in Regulation of Inflammation Proc. Soc Exper Biol & Med 75 : 854 (Dec.) 1950

[5] Long J B and Favour C. B Ability of ACTH and Cortisone to Delayed Type Bacterial Hypersensitivity Bull Johns Hopkins Hosp 155 (Sept) 1950

Concerning the suppressive effect of these hormones on allergic inflammatory response, Thorn[6] states that "ACTH or cortisone may dissociate the harmful effects of hypersensitivity from the beneficial reactions of immunity " However, it seems to us that this possibility should be viewed with great suspicion until there is definite evidence in its favor The effect of these hormones on immune mechanisms is certainly not clear at the present time For example, antibody levels have variously been reported increased, unchanged,[8] and decreased,[9] following administration of adrenotropic or adrenocortical hormones Also, the possible relationship between the lympholytic action of these hormones and antibody production or carriage, and the explanation for the reduction of serum gamma globulin[6] and the decrease in spleen size[10] following the administration of these hormones are still unknown But even leaving aside possible hormonal influences on production or carriage levels of immune bodies, it is conceivable to us that this hormone ability to depress inflammatory reaction, although seemingly useful in the hyperreactivity disorders, could, paradoxically, harm the organ by interfering with what is still considered the body's first line of defense in those disorders in which inflammatory reaction seems to serve a useful service, as in infections The physiological inflammatory reaction to a pathogen attempts to act not only as a physical barrier to the dissemination of the pathogen but also, to describe it simply, builds to the field of battle emergency lines of supply in the form of new blood vessels through which can flow a greater number of weapons such as macrophages and immune bodies If this defensive effort is depressed by the hormones, we can visualize a situation, such as may have occurred in our patient, in which the invading organism, unaffected by the hormones,[11] continues to multiply,[12] and through its toxic products attacks and destroys tissue which can temporarily neither defend nor repair itself Since inflammatory reaction is depressed, objective manifestations of inflammatory reaction products such as fever and increased sedimentation rate, may be diminished or absent, and the patient may, paradoxically, feel and look better in spite of continuing tissue damage[13]

The effect of these hormones on specific infections has not been investigated to any great extent Schwartzman has demonstrated the enhancing effects of cortisone and combined cortisone and ACTH on poliomyelitis infections in hamsters and mice ACTH alone fail to produce this effect[14] In humans, ACTH alone administered to patients already having poliomyelitis appeared to have no effect on the course of the disease[15] One wonders, in the light of Schwartzman's work, what effect cortisone might have had Perhaps the answer will be forthcoming during the next poliomyelitis epidemic if the supply of cortisone holds out It is intriguing to attempt to associate the stress occurring in youngsters who overexercise with the frequent appearance in them of clinical poliomyelitis during epidemics Could their increased adrenocortical output, perhaps through its lytic effect on fixed lymphoid tissue[16] with consequent release of enmeshed virus, or through some other unknown mechanism, be playing a part in activating the disease? Certainly, pregnant women, who have been shown to have increased adrenocortical activity manifest a greater incidence of poliomyelitis than nonpregnant women To theorize further, it is a common medical opinion that subclinical infections in general may become clinically evident when the "resistance" of the organism is lowered, as by chilling, anxiety states, overactivity, and other causes Might it be that these resistance-lowering circumstances are stress situations which, if prolonged enough, increase adrenal cortical output to the extent of activating in some manner the sub-clinical infection?

Concerning bacterial infections, there is evidence that ACTH and cortisone may be capable of enhancing the susceptibility of tissues to the primary effect of bacterial toxins[17] Mogabgab and Thomas found a marked enhancement of blood and tissue infection by Streptococcus hemolyticus in rabbits following injection of cortisone[18]

In tuberculosis, Spain and Molomut[19] have shown that tuberculous lesions in guinea pigs receiving cortisone were more extensive, more widely distributed, and less well organized than in control groups They feel that cortisone, through its inhibitory effect on formation of granulation tissue, inhibition of macrophage activity, and depletion of lymphocyte reserves, decreases resistance to progression of a tuberculous lesion Tubercle bacilli in a rat, an animal which is normally resistant to tuberculosis as compared to the guinea pig and man who are naturally susceptible to tuberculosis, under the influence of cortisone are able to multiply more rapidly, produce more diffuse disease, disseminate widely, and result in death of the animal[20] During the earlier investigations of the effect of these hormones in various disorders in humans, ACTH was administered to patients with active pulmonary tuberculosis, and although signs of inflammatory reaction products, such as fever and purulent sputum, were diminished, as one would expect, the lesions as seen on x-rays progressed[18]

[19] Spain D M and Molomut N Effect of Cortisone on Development of Tuberculous Lesions in Guinea Pigs and on Their Modification by Streptomycin Therapy Am Rev Tuberc 62 337 (Oct) 1950

In attempting to account for the presence of live tubercle bacilli in the lungs of our patient, the possibilities seem to be (1) a latent infection, (2) reinfection with exogenous tubercle bacilli, (3) destruction of lung tissue by pneumonitis of pyogenic origin with the breaking up of old healed focuses still containing live bacilli, and (4) hormonal fibrolysis of old healed lesions with release of live tubercle bacilli Concerning this last possibility, however, present evidence suggests that the adrenocortical hormones do not have a fibrolytic action, i e, they have no effect on granulation tissue already formed[10] It is impossible for us to state definitely which mechanism was involved in our case

The Committee on Medical Research of the Trudeau Society recently warned of the use of ACTH and cortisone in patients with active tuberculosis or possible latent tuberculous infection[21] They recommend routine diagnostic examination for tuberculosis of patients who are being considered for ACTH or cortisone therapy, a recommendation with which we heartily concur and to which we hope this report of our unfortunate patient will lend strong emphasis However, we think this warning should include all infections, particularly those for which we have as yet no specific therapy, since we might not be able to put out the fire once we had stirred up its embers Because of the suggestive evidence that these hormones might be hazardous, we have become extremely hesitant in administering them to patients for therapeutic purposes except as a last-resort measure Perhaps we are being overcautious, but as clinicians we feel that we have no right to employ any form of therapy until it has been proved to be not only effective but also, and more important, not inimical to the welfare of the body

SUMMARY

While he was receiving corticotrophin (ACTH) and cortisone for rheumatoid arthritis, active fulminant pulmonary tuberculosis developed in one of our patients

The possible relationship between the administration of these hormones and the appearance of his tuberculosis, and infections in general, is discussed

It is suggested that, until more information concerning the effects of these hormones is obtained, they should be used with extreme caution

ADDENDUM

Since this paper was submitted for publication, the above patient died At autopsy, bilateral caseo-cavernous tuberculosis and confluent tuberculous pneumonia were found Additional findings were rheumatoid arthritis and hepatic cirrhosis

Other examples of complicating infections proved at autopsy in patients receiving these hormones are as follows

1 Diffuse purulent meningitis developed in a patient with multiple myeloma

2 A patient with acute lymphatic leukemia died with acute disseminated actinomycosis

3 A patient treated for stasis dermatitis was found to have miliary tuberculosis

The detailed report of these cases will be published at a later date

SARCOIDOSIS BENEFITED BY PREGNANCY

REPORT OF A CASE

Robert H Berman, M D, Detroit

A review of many textbooks of medicine and of obstetrics revealed no mention of pregnancy in sarcoidosis There have been, however, some reports of pregnancy in the remission or quiescent stage of the disease The removal of the spleen in a patient in the fifth month of pregnancy complicated by purpura has been reported[1] The sarcoidosis was apparently not suspected until the spleen was sectioned No other evidence of sarcoidosis was noted The pregnancy terminated normally In the same article, another similar case was briefly mentioned in the discussion Dr Warfield T Longcope stated that he had not found any pregnant patient with active sarcoidosis in the large series of cases he had studied He mentioned, however, that one of his patients did have two successful pregnancies after what appeared to be recovery from a rather extensive sarcoid involvement of the lungs[2] In a clinical review of 11 cases of sarcoidosis, three of the four female patients described had had pregnancies Two had full-term pregnancies, one, a miscarriage[3] The case histories, however, gave no indication as to whether the pregnancies occurred before or during the sarcoid involvement Recently there was a report of a patient with sarcoidosis who had two pregnancies[4] The first pregnancy was aborted, and the second was allowed to go to full term The sarcoidosis in the second was apparently in a quiescent stage and was not affected by the pregnancy

The case presented here appears to be the first reported of a sarcoid patient with two full-term pregnancies, where, at least in the second pregnancy, the sarcoidosis appeared to be in an active stage

REPORT OF CASE

The patient then 20 years old, complained in September 1939, of ‘flashes in eyes” Examination disclosed iritis The white blood cell count was 6 950 and the differential count was normal with 1% eosinophils Chest x ray and tuberculin test

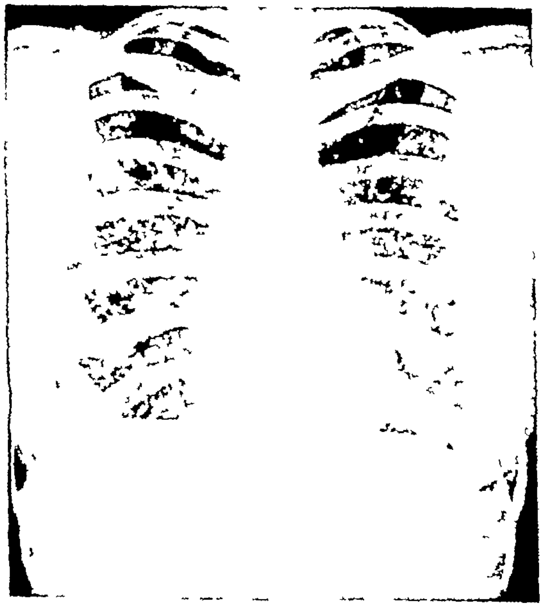
4 Russel K. P Sarcoidosis (Boeck s Sarcoid) and Pregnancy Bull Moore White Clin p *14 1950*

were negative The patient was referred for ophthalmological examination, and iritis and conjunctivitis of uncertain origin were reported In 1941 a chest x-ray taken elsewhere disclosed bilateral lung involvement, which was thought to be moniliasis Repeat films in 1942 1943 (Figure) and 1945 showed little change

In May, 1946, the patient had a child She consulted me in May, 1947, because of acute chest pain and cough Fine crepitant rales, scattered through both lungs were heard The spleen at this time was greatly enlarged Chest films showed little change from 1942 She was seen at Mayo Clinic in August, 1947, where the diagnosis of sarcoidosis was made and confirmed by inguinal gland biopsy In September, 1947, the spleen extended almost to the umbilicus and to the left anterior superior spine Dr Paul S Barker, professor of medicine at the University of Michigan Medical School, suggested that calciferol be tried in the dosage used in the University Hospital

In February, 1948, a month after calciferol was started, the patient was found to be over three months pregnant Decision to allow pregnancy to proceed was made with much concern, but the spleen receded, vomiting stopped, and pregnancy proceeded normally, with the patient subjectively well throughout By the eighth month of pregnancy the spleen was palpable only on deep inspiration Spleen percussion also showed the decreased size X-ray of the lungs remained unchanged In June, 1948 the total serum protein was 7 19 gm , with albumin 2 65 gm , and globulin 4 54 gm



Roentgenogram of chest taken in 1943 showing extensive infiltration of both lungs.

On Aug 12 1948, the day before her delivery the total serum protein was 4 98 gm , with albumin 3 16 gm and globulin 1 82 gm , a return to normal ratio The patient was delivered of a healthy 6 lb (2 7 kg) girl by Dr Albert E Catherwood, at Harper Hospital, Detroit The spleen soon after delivery was barely palpable after deep inspiration On the third day it was palpable without inspiration Soon after breast feeding was stopped, the patient began to again have cough and dyspnea She stated that the same order of events occurred in her first pregnancy A chronic cough disappeared soon after the start of that pregnancy, she was excellent during pregnancy and lactation but began to have symptoms afterward

In December, 1948, the spleen again reached almost to the umbilicus and to the left anterior superior spine The same month in her home she was in close contact with a worker who had advanced pulmonary tuberculosis In February, 1949, she became acutely ill with cough fever, and marked dyspnea No acid fast bacilli were found in the sputum The total serum protein was 6 gm with albumin 3 1 gm , and globulin 2 9 gm She complained of severe abdominal pain and diarrhea A moderate cough and morning sputum continued and there was a slight but constant, weight loss In June cyanosis of lips and fingertips appeared The cough and cyanosis were relieved only by oxygen On June 25, 1949, sputum showed acid fast bacilli A tuberculin test the next day showed a positive reaction Specimens the next two days were again positive The roentgen report by Dr Lawrence Reynolds on chest film of July 5 1949 was "The lesions of the chest at this time are of the miliary character and have every appearance of being changes incident to miliary tuberculosis

The patient s weight was now 85 lb (38 6 kg), instead of her normal 110 (49 9 kg) She was placed in the Detroit Tuberculosis Sanatorium and her symptoms abated under daily streptomycin therapy After four weeks moderate vertigo and mild urticaria appeared A change to dihydrostreptomycin did not ameliorate the vertigo and urticaria She was placed on a regimen of streptomycin, 1 gm every third day The vertigo disappeared Slight urticaria persisted Para-aminosalicylic acid, 9 gm daily, was added On Nov 21, 1949, the Robinson Power Kepler test was positive in both urine and blood, and seemed to support the clinical suspicion of Addison s disease The 24-hour urine assay showed diminished 17-ketosteroids, 3 8 mg suggesting adrenal involvement In February, 1950, the eosinophil test was done The white blood cells showed a drop from 5,300 to 5,050, and the circulating eosinophils from 80 per cubic millimeter to 25 per cubic millimeter after epinephrine This indicated normal adrenal cortex response The possibility of an intermittent Addison status was considered The patient s weight April 2, 1950, was 109 lb (49 4 kg) Spleen remained enlarged Sputa examinations on April 2 and April 20 were negative A chest film on April 28, 1950, showed a change from a miliary character to that of a bilateral fibrosis The patient's status and findings have remained the same to Sept 1, 1950

COMMENT

The most important feature in this case was the patient's excellent status, judged from the patient's own statement, during her first pregnancy, and improvement noted by me in her second pregnancy The improved clinical state and the reduction in spleen size to normal during the second pregnancy suggested a benefit from the pregnancy The reversed albumin-globulin ratio of the serum proteins, often found in sarcoidosis, became normal in the latter part of the pregnancy and also suggested improvement On the other hand, the lung infiltration did not change, and the tachycardia persisted The latter might possibly be due to sarcoid involvement of the heart, despite negative cardiac findings throughout

It has long been apparent that pregnancy exerts a neutral or favorable influence in many diseases The improvement in atrophic arthritis by compound E (17-Hydroxy-11-Dehydrocorticosterone)[5] suggests the benefits in pregnancy may be due to the increased elaboration of compound E or of hormones with similar effects The favorable effect of pregnancy on peptic ulcer has been considered as possibly due to hormonal factors[6] The favorable effect of pregnancy on some diabetic mothers may be due to insulin from the hypertrophied islets of the fetus In Addison's disease, pregnancy usually exerts an unfavorable effect When the patient improves during pregnancy, compensatory hypertrophy of the fetal adrenal cortex is postulated

The involvement of the lymphoid system in sarcoidosis makes it tempting to consider adrenal involvement as a possible cause of sarcoidosis The value of adrenal cortex factors in diminishing enlarged spleens and lymph glands in other diseases has been recently noted [8] Calciferol and dihydrotachysterol as therapeutic agents appear to be valuable in sarcoid therapy The close relation of these drugs to the adrenal and ovarian steroids seems significant In this case trial of corticotrophin (ACTH) was considered, but was delayed because of the tuberculosis

The possibility of coincidental temporary improvement in the sarcoidosis with the pregnancies and during lactation cannot be denied It is obvious that one must be wary of conclusions from a single case The fact, however, that improvement occurred in both pregnancies appears significant

CONCLUSIONS

A patient with sarcoidosis had two normal full-term pregnancies, with improvement in the sarcoid status during the pregnancies

The hormonal changes evoked by pregnancy may be a clue to the etiology and treatment of sarcoidosis

TREATMENT OF SALMONELLA SEPTICEMIA WITH CHLORAMPHENICOL

James J Hines, M D , Chicago

This is a report of a case of Salmonella septicemia without gastrointestinal symptoms successfully treated with chloramphenicol (chloromycetin®)

REPORT OF A CASE

E L , a 27-yr -old Negro woman, entered the Central Free Dispensary of the Presbyterian Hospital on Aug 7 with complaints of severe parietal headache, sore throat pain in the low back, and cough of one week's duration In the week prior to her admission she suffered two episodes of severe shaking chills and high fever Her throat was sore, she could not swallow solid foods and she had been lethargic for a week No history of diarrhea or gastrointestinal upset was elicited, and the systemic review indicated essentially normal conditions except for pain in the chest when coughing This cough was productive of small amounts of yellowish sputum A diagnosis of chronic pelvic inflammatory disease was made in this clinic two years before her present admission

Physical examination revealed a small 27 yr -old Negro woman who appeared acutely ill Her temperature was 102 F and her pulse rate 120 and regular The abnormalities found were markedly reddened tonsils and pharynx, a soft systolic murmur over the entire precordium, tenderness in the lower abdomen, and tenderness and enlargement of the left Fallopian tube on pelvic examination

Laboratory Findings—The erythrocyte count was 3,890,000 with 12 gm of hemoglobin, and the leukocyte count was 3,500 of which 78% were polymorphonuclears and 22% lymphocytes The Kahn reaction was negative, and the urine examination findings were normal The blood sedimentation rate was 44 mm an hour (Wintrobe) Three successive negative stool cultures were reported Streptococci of the viridans group were recovered from a throat culture X-ray examination revealed no abnormalities in the heart or lungs, and the electrocardiogram was normal Cultures of blood drawn on the first, second, and third days of the patient's illness showed pure cultures of a gram negative bacillus which produced acid, gas, and hydrogen sulfide in Kligler's medium, no fermentation in Endo agar, and no fermentation in lactose and saccharose mediums and failed to liquefy gelatin or produce indole There was no agglutination by paratyphoid serums A or B In the Illinois State Department of Health Laboratory the organism proved to be salmonella Montevideo by slide agglutination with nonspecific antiserums Agglutinations with typhoid antiserums were negative Qualitative sensitivity tests revealed that chloramphenicol completely inhibited the growth of this organism There was no growth retardation by aureomycin streptomycin, penicillin, or sulfadiazine

Clinical Course—On the day of admission the patient was given 600 000 units of procaine penicillin G for aqueous infection (crysticillin®), which was continued for two days with no change in the temperature or the symptoms After blood cultures revealed S Montevideo infection, chloramphenicol was administered in doses of 250 mg every four hours after an initial dose of 1 gm Twenty four hours later the patient was afebrile and her symptoms subsided The systolic murmur heard on admission was softer The chloramphenicol was continued for four days with a total dose of 6 gm Two weeks following cessation of treatment the patient was afebrile and asymptomatic Repeated blood and stool cultures were negative

COMMENT

It is interesting to note the striking similarity of the infection in this case to Salmonella suipestifer infection Harvey [1] in 1937 reviewed the literature of S suipestifer and reported 21 new cases He stated that in the majority of his cases there was an uncomplicated bacteremia simulating typhoid He found that the organism was readily cultured from the blood but rarely from the stools Forty-four of the 71 cases that he reported or reviewed were without localizing signs of infection Goulder, Kingsland, and Janeway [2] reported 11 cases of S suipestifer with one case of endocarditis due to this organism Their cases also showed a typhoidlike infection without localizing signs of infection

S Montevideo was first isolated in Uruguay from lymph nodes of healthy swine and later from infants with summer diarrhea by Hormaeche and others [3] They found the organism to be from the VI and VII groups, with flagellar antigens related to those of S enteritidis and S Senftenberg, without being identical with either of them

This organism also has been found in the stools of chicks and human beings [4] The greatest animal reservoir of S Montevideo is probably in domestic fowl [4]

Edwards and Bruner[5] have found it in 17 out of 325 food-poisoning outbreaks in man in the United States between 1934 and 1941

An epidemic of S Montevideo food infection was reported in 1944 by Myers and Eckles[6] In this epidemic 975 men became ill with fever, diarrhea, nausea, vomiting, and headache None of these patients died, and most of them were discharged after 96 hr with few or no symptoms

In the period from April, 1939, to the close of 1945 about 2,000 Salmonella infections were identified by the New York Salmonella Center[7] Cultures came from many parts of the United States and some adjoining territories Of these 2,000 cases of Salmonella infection, 134 proved to be due to S Montevideo In the literature of the established cases of S Montevideo no case has been reported in which a septicemia occurred without gastrointestinal symptoms

Because of the associated murmur there is an unproved possibility that this case is one of Salmonella endocarditis A case of this disease caused by S Minnesota with no demonstrable primary focus was reported by Kurz, Crehan, and Thomson[8] In that case no improvement was effected by sulfadiazine, penicillin, or streptomycin, and the patient died

This case demonstrated dramatic clinical response to chloramphenicol therapy, and a qualitative sensitivity test showed that growth of the organism was completely inhibited by this drug and not by other antibiotics

Chloramphenicol has been employed successfully by Ross and others[9] in the treatment of S enteritis, but none of their cases was complicated by septicemia

Although there is no established link, two possible foci of infection are suggested, namely, the pharyngeal and pelvic infections The pharyngeal infection was a prominent part of the clinical picture, but the culture revealed only streptococci of the viridans group Infection from a pelvic focus not infrequently is due to the Salmonella group, and there is evidence here of chronic inflammatory disease of long standing However, there is no proof of a bacteriologic relationship in this case There is also no evidence of a focus in the intestine

SUMMARY

An instance of S Montevideo septicemia without gastrointestinal symptoms successfully treated with chloramphenicol is described, the similarity of this case to cases of S suipestifer infection is suggested, and the characteristics, incidence, and bacteriology of the organism are discussed

USE OF CHLORAMPHENICOL AND TYPHOID VACCINE IN INFANT BORN OF TYPHOID CARRIER

Irving Mond, M D , Beacon, N Y

In the course of routine epidemiological studies made since 1934 on all food handlers, professional personnel, and patients in the obstetric and pediatric services of the Bronx hospital,[1] the staff was recently confronted with the problem of a newborn child delivered by a previously undiscovered typhoid carrier This case report is concerned with bacteriologic and serologic studies of mother and infant and with the prophylactic use of chloramphenicol and vaccination for protection of the baby

REPORT OF CASE

M A , a 25 yr -old nullipara, was admitted to the antepartum clinic on June 9, 1949 Her last menstrual period was on Jan 20, 1949 The patient had been in a German concentration camp and had experienced recurrent episodes of cholecystitis during the period 1946-1948 Her prenatal care progressed normally and she was admitted to the Bronx Hospital on Nov 7 1949, in active labor At 1 05 p m she gave birth spontaneously to a living male child Routine stool examination done on admission, Nov 9, 1949, was reported positive for Salmonella typhosa, and mother and child were isolated Agglutination tests for the mother done on Nov 10 were positive for Salmonella typhosa H antigen in a dilution of 1 10 and for Vi antigen in a dilution of 1 16 Confirmatory fecal studies were made at Bronx Hospital on Nov 15 and Nov 18 and several times by the New York City Department of Health Aspirated duodenal contents also revealed S typhosa in great numbers, indicating the gall bladder or hepatic ducts as the reservoir of infection The patient had no physical complaints, and her postpartum convalescence was uneventful

The male infant was admitted to the nursery on the day of delivery in good physical condition and was transferred to the isolation ward two days later when the positive fecal culture of its mother was revealed On Nov 10 the agglutination tests for S typhosa O and H antigen were negative, the blood count was as follows hemoglobin 16 2 gm , erythrocytes 5,000,000 per cubic millimeter, leukocytes, 6,000 per cubic millimeter, with a differential of lymphocytes 75%, segmented forms 18%, eosinophils 2%, and monocytes 5% Fecal cultures from Nov 10 through Nov 18 were negative for Salmonella and Shigella organisms A blood culture on Nov 21 proved sterile and a blood count on the same day was normal On the third hospital day, Nov 9, 1949, the child began to receive chloramphenicol, 250 mg per day On Nov 14 six days later administration of the antibiotic was discontinued because of anorexia After this, the child did well and was discharged on Nov 22, 1949

On Dec 1, 1949, the infant was readmitted for immunization Physical examination revealed no abnormality Routine urinalysis elicited negative findings Blood agglutination studies for typhoid were negative Subsequent numerous fecal cultures for Eberthella typhi made over the period from Dec 2, 1949 to April 1 1950, were all negative The Wassermann and Kahn tests were negative

On Dec 2 1949 the patient received 50 000 000 organisms of a stock monovalent typhoid vaccine of wide antigenic pattern A second dose of 100 000,000 was administered on Dec 16 a third

---

From the Departments of Laboratories, Obstetrics and Pediatrics Bronx Hospital New York

Dr A J Weil Bacteriologist supplied help and advice in the bacteriologic and serologic examinations These studies were made possible by the permission of Drs M Rosensohn Director of Obstetrics A C Posner Attending Obstetrician and J Lapin Attending Pediatrician

[1] Felsen J and Wolarsky W The Hospital [illegible] Hospitals 14 41 (Aug) 1940

dose of 150,000,000 was given on Dec 23, and a fourth of 200,000,000 on Dec 30 No reactions occurred, and the infant was discharged for follow-up in the outpatient department

On Jan 6, 1950, the infant received 250,000,000 organisms, resulting in a reaction characterized by fever, anorexia, and irritability Immunization was discontinued Repeat blood agglutination titers for typhoid O and H antibodies on Jan 23 and April 1, 1950, were entirely negative Frequent physical examinations of the infant during this period revealed an occasionally, not persistently, palpable spleen, but no other abnormality

COMMENT

In an evaluation of the prophylactic use of chloramphenicol and the serologic implications of these studies, certain known facts had to be borne in mind For example, there is no evidence that there is any transplacental transmission of protective antibodies against Salmonella or Shigella infection from mother to infant[2] Indeed, the newborn are very susceptible to these infections, and the mortality rate is high[3] The chances of the infant's being infected are also high, since the fetal head crosses the perineum, which is often soiled by intestinal contents of the mother In some cases the obstetrician may transmit the infection by means of his soiled gloves In either case it is an "intestine to mouth" infection In this case, the absence of typhoid organisms in the blood of the newborn was ascertained, hematogenous dissemination through the placenta had not occurred

Chloramphenicol is transmitted through the placenta from mother to infant without toxic manifestations[4] It therefore appears feasible, when the mother is known to be a typhoid carrier, to administer chloramphenicol before term, for the protection of the fetus

The effects of active immunization could not be proved by our serologic studies, since demonstrable protective or other antibodies are not readily elicited in the newborn

On the basis of these studies, we can conclude only that an infant born of a typhoid carrier had every chance of becoming infected but did not do so, possibly because of the prophylactic use of chloramphenicol and active immunization The mother has been urged to undergo cholecystectomy on the supposition that the gall bladder may be the sole repository for her residual infection and, more particularly, since the positive fecal cultures have persisted in spite of chloramphenicol therapy The question naturally arises at this point, if the organism is resistant to chloramphenicol therapy in the mother, how could the same antibiotic be effective in the infant? It is possible that the drug may be more effective when used before mass infection has occurred

SUMMARY

A case is presented of an infant born of a mother who proved to be a typhoid carrier Prophylactic use of chloramphenicol and active immunization in the infant and associated serologic studies are described

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ASPECTS OF ARTIFICIAL INSEMINATION

There is little that can be said with any degree of assurance concerning the medicolegal aspects of artificial insemination for such aspects have not been explored satisfactorily by any court of appellate jurisdiction in the United States Yet, the procedure is no longer novel It was reported (*J A M A* **116** 2747 [June 21] 1941) that by 1941 almost 10 000 pregnancies had occurred in the United States as a result of this procedure Physicians and lawyers alike seek answers to the many questions that may arise concerning a situation not known to the common law and not now covered by specific statutory provisions questions relative to legitimacy, to inheritance, and to liability in connection with the selection of donors, among others

PHYSICIAN S LEGAL RESPONSIBILITY

If the donor is the husband of the woman inseminated artificially, the application of the ordinary laws relating to malpractice will probably be sufficient to protect the rights of all parties The child, if one results, will unquestionably be legitimate, and, if the physician exercises due diligence, uses ordinary knowledge and skill and his best judgment, and respects the confidence of his patient, he will not be liable for damages even though the resulting baby be defective What constitutes due diligence, ordinary knowledge and skill will depend on the accepted practice at the time in the community in which the artificial insemination is performed or in a similar community among physicians engaged in or holding themselves out as ready to engage in the artificial insemination of would be mothers

When the physician uses semen from a donor other than the husband, there is a possibility that complications may arise In such cases the law must be applied to a novel situation, but certainly the physician assumes a certain degree of responsibility as to the suitability of the donor In selecting a donor, or in passing judgment on the fitness of a donor offered by a woman who wishes to be artificially impregnated, or by her husband, the physician assumes responsibility the nature and limits of which have not been determined by statutory law or defined by the courts

What the law requires of him in the way of investigation of the suitability of a prospective donor, from the standpoint of heredity and present phyiscal condition, and how far he will be held liable for errors of judgment in vouching for the fitness of the proposed donor, no one can say with any degree of certainty

How far the courts will recognize a right on the part of a woman who is to be inseminated and of her husband, to assume by express contract the risks of unsatisfactory results due to the unfitness of the donor is impossible to say A patient may by express agreement relieve a physician of some of the obligations imposed on him by the usual implied contract for medical services but not all of such obligations How far the law will permit a woman or her husband to assume the risks of the fitness of a donor, which is a matter that is or should be peculiarly within the knowledge of the physician, is uncertain

ADULTERY—LEGITIMACY

Because criminal statutes are strictly construed it is doubted by some that a medical procedure such as this, performed privately with the consent of all concerned, violates statutes relating to adultery or rape In support of this view it is pointed out that statutes concerning adultery use phrases such as "if any man and woman shall live together in an *open* state of adultery" or the words open,' 'notorious, cohabit or the like. In this procedure there is no cohabitation between man and woman not married to each other and there is no openness or notoriety associated with it There is no carnal knowledge of a woman as that term is used in law The procedure a medical one designed to cause conception, lacks the elements of lust, passion or force There is an absence of a physical, sexual relationship between man and woman It is also pointed out that statutes relating to adultery and rape apply to natural physical acts whereas this procedure as its name acknowledges is artificial

Others believe that the operation does constitute adultery It is said that a child which results from heterologous artificial insemination is conceived outside of the marriage relation and is not the child of a wife and her husband It is further stated that this procedure is unlawful as against public policy and that consent to such unlawful act can not be valid nor can it make the act lawful

A child born in lawful wedlock is presumed to be legitimate Because a child conceived as the result of a heterologous artificial insemination of a married woman with the consent of her husband is born in lawful wedlock, one school of thought believes that the child so conceived should be considered and is legitimate This group reasons that consent by both husband and wife to the procedure is a valid exercise of a right incident to the marriage relationship to accomplish one of the ends of marriage It is also reasoned that because there is no express prohibition in law against this procedure the resulting child is legitimate. This group does not make clear what the status of a child would be were it conceived in the absence of the husband s consent, although it is implied that it would be illegitimate

Another school of thought holds that the procedure is unlawful in itself because it is artificial and contrary to nature and thus against public policy This group believes that the child is unlawfully conceived and therefore is not legitimate This group advocates that adoption proceedings be completed to protect the rights of a child so conceived or that statutes relating to the procedure itself and to the rights of the child be adopted

In civil law it may well be doubted that a child so conceived even with consent, would satisfy a requirement of will or deed requiring for its execution lawful issue of his body or "heirs of his blood" It may be questioned whether such issue is the grandchild of the paternal grandparents

COURT CASES

In a Canadian case decided in 1921, *Orford v Orford 49 Ontario Law Reports 15* there was involved an alleged case of artificial insemination, performed in England on a woman whose husband was in Toronto Canada While the question was not definitely determined by the court it was strongly intimated that a woman who submits to an artificial insemination without the consent of her husband, the donor being a man other than her husband commits adultery The court in its dicta described adultery as the voluntary surrender to another person of the reproductive powers or faculties of the guilty person"

Another case arose in New York in 1947 *Strnad v Strnad 78 N Y S (2d) 390* The court had granted a decree of separation to a wife and in that decree authorized the husband to have custody over the weekends of a child born to the wife The wife subsequently asked the court to amend the decree on the ground that the child resulted from an artificial insemination, the donor being a person other than the husband and therefore the husband was not the father of the child In the written opinion of the Supreme Court of New York County, New York it was said

> The court has assumed for the purpose of this litigation in the light of the record and the concessions made by the defendant that the plaintiff was artificially inseminated with the consent of the defendant and that the child is not of the blood of the defendant Predicated on that assumption the court concludes as follows
>
> "(1)
>
> (2) The court holds that the child has been potentially adopted or semi adopted by the defendant In any event in so far as this defendant is concerned and with particular reference to visitation, he is entitled to the same rights as those acquired by a foster parent who has formally adopted a child if not the same rights as those to which a natural parent under the circumstances would be entitled
>
> "(3) In the opinion of this court assuming again that the plaintiff was artificially inseminated with the consent of the defendant the child is not an illegitimate child Indeed logically and realistically the situation is no different from that of a child born out of wedlock who by law is made legitimate upon the marriage of the interested parties
>
> (4) The court does not pass on the legal consequences in so far as property rights are concerned nor does the court express an opinion on the propriety of procreation by the medium of artificial insemination "

In an English case *L v L* [1949] *1 All E R 141* decided Nov 30, 1948 (Probate Divorce and Admiralty Division) a decree of nullity was granted to a wife on the ground of her husband s incapacity to consummate the marriage although the wife had borne a child after having been artificially inseminated with her husband s semen Evidence established that the husband was psychologically unable to have normal sexual relations with his wife It was further established that he had consented to the artificial insemination to satisfy his wife s desire for a child and her hope that normal relations might be established Although the marriage was set aside as null and void and the child held to be illegitimate this case can only be taken as authority for the principle that the artificial insemination of a wife with her husband s semen normal intercourse being impossible, did not, under English law, consummate a marriage

LEGISLATION

No legislation has been enacted in any of the states which deals specifically with the several aspects of artificial insemination Since 1948 however, bills have been introduced in the legislatures of five states dealing with the rights of a child born following an artificial insemination

A New York bill (S 745) provided as follows

> A child born to a married woman by means of artificial insemination with the express or implied consent of her husband shall be deemed the legitimate natural child of both the husband and his wife for all purposes and such husband and wife and such child shall sustain toward each other the legal relation of parent and child and shall have all the rights and be subject to all the duties of that relationship including the rights of inheritance from each other

This bill failed of enactment Another bill (S 587) containing the provision similar to the quotation plus a further provision that consents for this procedure should be filed with the county clerk was introduced in the New York Senate in 1950 It, too failed of enactment

A proposal (S 199) was submitted in 1948 to the Virginia legislature This bill which was not enacted provided simply the children born as a result of artificial insemination should be considered the same as legitimate children for all purposes if the husband of the mother consented to the operation

In 1949 bills were introduced in Wisconsin (Assembly Bill 407) Indiana (H B 350) and Minnesota (H B 1090 1091 1092 and S B 1108 1109 and 1110) None was enacted into law The Wisconsin and Indiana bills declared a child so conceived to be legitimate and to have full rights of inheritance In addition the Indiana bill provided that the physician and the mother of the child should retain copies of consent to the procedures while the Wisconsin bill provided that such consent would have to be filed with the registrar of probate In Minnesota three bills were introduced in the House and three companion bills were introduced in the Senate One pair provided that artificial insemination was unlawful but that children so conceived were legitimate another provided that artificial insemination was lawful if the husband s semen alone was used, and the other provided that artificial insemination was a lawful procedure Provisions regulating and controlling the performance of the operation were established mother and donor would have to be free of a disease affliction or imperfection likely to be communicated to or inherited by the child the doctor must be of the opinion that the donor resembles husband in physique, appearance and temperament and that donor s and donee s blood are compatible donors may not be nearer in kin to the donee than second cousins

The Sanitary Code of the City of New York was amended effective July 1 1947, to impose certain restrictions on the use of donors for artificial insemination This amendment and the regulations issued pursuant to it, required among other things, that a donor be given a complete physical examination that donors found to be suffering from specific conditions may not be used that the blood of the donor and donee be typed with respect to the Rh factor and that the physician performing the operation prepare records showing compliance with these requirements

MEDICOLEGAL ARTICLES

There have been a number of articles written on the medicolegal aspects of this procedure Reference to them with brief description of their content follows

Abel, S The Present Status of Artificial Insemination, Surgery, Gynecology and Obstetrics, December, 1947 (Surgical Publishing Co 54 E Erie St, Chicago) Dr Abel, of the Department of Obstetrics and Gynecology at Northwestern University Medical School, discussed not only the legal aspects of artificial insemination but also its theological aspects and includes a suggested draft of a law dealing with the legitimacy of the issue of children so conceived

Tucker, F B Legal Problems of Artificial Insemination, Woman Lawyers Journal, Spring, 1947 (National Association of Women Lawyers, 80 Federal St, Boston 10) Miss Tucker, of the Chicago, Illinois, Bar, discusses the physician s duties and responsibilities in artificially inseminating a married woman, points out legal pitfalls to be wary of, and comments on the need for legislation covering this subject

Seymour F I, and Koerner, Alfred Medicolegal Aspects of Artificial Insemination J A M A **107** *1531 (Nov 7) 1936* (American Medical Association, 535 No Dearborn St, Chicago 10, Illinois) Drs Seymour and Koerner discuss the legal unknowns in the subject of artificial insemination and emphasize the responsibility of the physician not only in the creation of the child but in its future welfare, particularly in its adjustment to its own family unit'

Seymour F I, and Koerner, A Artificial Insemination, Present Status in the United States as Shown by a Recent Survey, J A M A **116** *2747 (June 21) 1941* The authors analyze the means and results of artificial inseminations resulting in 9,489 pregnancies, 97 per cent of which resulted in the birth of live babies While the article is statistical and entirely medical, it may be of interest to lawyers and legislators who desire to compare the percentage of medical complications arising from artificial insemination with those occurring in natural pregnancies

Greenhill, J P, and Wright, J F Artificial Insemination Its Medicolegal Implications, A Symposium American Practitioner, January 1947 (Also found in 'Symposium on Medico legal Problems' Ed S A Levinson, Published by J B Lippincott Philadelphia, in 1948) Dr Greenhill, Professor of Gynecology at Cook County Post-Graduate School and Mr Wright of the Chicago, Illinois, Bar Association presented talks concerning both the medical and legal history and medical and legal problems of artificial insemination at a meeting of physicians and lawyers under the co-sponsorship of the Institute of Medicine of Chicago and the Chicago Bar Association A transcript of the discussion afterwards contains questions of practical interest posed by medical and legal practitioners The answers emphasize practical medical and legal problems, and suggest various solutions

Foreign Letters, Paris, Artificial Insemination J A M A **135** *729 (Nov 15) 1947* This letter from THE JOURNAL'S Paris correspondent summarizes briefly the views of French doctors, lawyers and theologians concerning artificial insemination

Queries and Minor Notes, J A M A **110** *1857 (May 28) 1938* The answer to a query concerning the practicability of artificial insemination calls attention to possible social, legal and certain physiologic dangers which should be considered by the physician contemplating this operation

Seashore, R T Artificial Impregnation, Minnesota Medicine, pp 641-644, Sept 1938 (Minnesota Medicine, 2642 University Ave, St Paul 4, Minnesota) The author in presenting a case discusses the legal aspects of this operation as it actually occurred to him, a physician, and his attorney The article contains a form of consent, outlines procedure for its use and makes a recommendation as to custody of the consent forms

Guttmacher, A F Role of Artificial Insemination in the Treatment of Sterility J A M A **120** *442 (Oct 10) 1942* Dr Guttmacher in discussing the social aspects of artificial insemination, having discussed the medical aspects, sets forth four rules described as common sense rules to be followed by the doctor in any case of contemplated artificial insemination

Haman J O Artificial Insemination California Medicine, pp 353-357, May, 1948 (California Medical Association, 450 Sutter St, San Francisco 8, California) The author presents a form of consent the use of which by the couple is advocated chiefly as protection for the physician The author calls attention to the fact that the type of legislation which may be enacted will depend upon the care or lack of care by physicians in performing this operation concluding that lack of care and integrity by physicians will arouse public opinion and engender legislation banning this practice

Forbes, R The Medico-Legal Aspects of Artificial Insemination, The Medico Legal and Criminological Review **12** *138 (July-Sept) 1944* (The Medical Defense Union, 49 Bedford Square, London, W C I, England) The principal part of this article, read by Dr Forbes, Secretary of the Medical Defense Union of England, before the Medico-Legal and Criminological Society, develops the history and medical aspects and the legal pitfalls of artificial insemination The reported comments of the doctors and lawyers of the audience offer varied observations as to the practice and some pertinent suggestions relative to legal problems involved

Comment (Author not named) Artificial Insemination A Parvenu Intrudes on Ancient Law, The Yale Law Journal, **48** *457 (Feb) 1949* (Yale Law Journal Co, 127 Wall St, New Haven, Conn) This article develops the thesis that because the operation of heterologous insemination, AID, was unknown and unthought of while laws developed legislatively and judicially the legal problems which may obtain by reason of the operation cannot be answered by reference to the law as it stands The article concludes that legislative decision is the only ultimate solution to the legal questions involved and discusses briefly principles, legal and social, which in the writer's opinion should be considered to achieve sound legislation

The Report of a Commission Appointed by His Grace The Archbishop of Canterbury, Artificial Human Insemination, (Feb) 1948 (Printed by The Talbot Press, SPCK, Saffron Walden, Essex, England)

Artificial Insemination—Illegitimacy (Editorial), J A M A **112** *1832 (May 6) 1939* This editorial suggests that a child born after an artificial insemination, the donor being a person other than the husband of the woman inseminated, must be considered as illegitimate and adoption proceedings are advocated

J G P Artificial Insemination v Adoption, Virginia Law Review, October, 1948 (Virginia Law Review Association, Charlottesville, Virginia) The author expresses his opinion that heterologous artificial insemination is contrary to law and suggests that couples who are incapable of having children resort to adoption procedures rather than this operation

Artificial Insemination (Editorial) The Journal of the Indiana State Medical Association, July 1950 (1017 Hume Mansur Bldg, Indianapolis 4) This editorial expresses doubt that the procedure violates any criminal law and suggests that when consent to the operation is obtained from the husband authorizing the insemination of his wife with the semen of a donor, the child, if one results, is legitimate

Russel, M A Plea for Standardization of Donors, J A M A **144** *461 (Oct 7) 1950* The author states that a doctor in performing this procedure should carefully investigate the background of the donor as well as examine him physically and lists the qualifications which, in his opinion, should be sought in donors

Artificial Insemination (Abstracts of Papers), The Medico Legal Journal, Part One, 1950 (The Medico-Legal Society, 125, High Holborn, London, W C I) Papers presented to the Manchester branch of the Society and discussion following their presentation are abstracted Legitimacy of issue, the legality of the operation, and the question of whether the procedure is adultery were ably considered

Problems of Artificial Insemination (Editorial), New York State Journal of Medicine, March 15, 1948 (Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York) This editorial discusses the *Strnad* case as it points up problems connected with artificial insemination

Artificial Insemination (Editorial) British Medical Journal, May 3 1947 (British Medical Association, Tavistock Square, London, W C I) The view is expressed that heterologous artificial insemination may be adulterous and the resulting child illegitimate It is suggested that the doctor who engages in this practice, though not guilty of a criminal offense, stands on insecure ground and close to dangerous pitfalls

Regan L J Doctor and Patient and the Law ed 2 C V Mosby Company, St Louis, 1949

Schatkin, S B Disputed Paternity Proceedings ed 2, Matthew Bender Company, New York City, 1947

Dr Regan's book considers the several aspects of artificial insemination He includes a suggested form of consent to be used by the parties who undergo this procedure In Mr Schatkin s book the question of legitimacy is discussed

FORM OF CONSENT

The following form has been suggested for use in artificial insemination cases [1]

CONSENT TO ARTIFICIAL INSEMINATION

WHEREAS We the undersigned and are husband and wife having been married in the City of County of State of and

WHEREAS this marriage has to the present time been childless and

WHEREAS we are desirous of having a child and have been informed that is incapable of procreation

NOW THEREFORE we and each of us do hereby request and authorize Dr to select a donor who in his sole discretion and judgment will meet the following qualifications

We and each of us further request and authorize the said Dr to obtain from said donor sperm necessary to inseminate the said and to thereupon artificially inseminate her with said sperm in the usual and customary manner and to do such acts in furtherance thereof as may seem necessary and advisable in the sole discretion of Dr

We and each of us understand that said Dr does not warrant or guarantee the qualifications of said donor and that in determining whether the said donor meets the aforesaid qualifications the said Dr shall be required to make only such investigation of and concerning such donor as shall in the sole discretion of said Dr seem reasonably necessary

We and each of us further agree that we shall not now nor at any future time require nor expect said Dr to obtain or divulge to us the name of said donor nor any other information concerning said donor s race nationality characteristics qualities or any other information whatsoever concerning said donor

We further agree that following the said insemination the said Dr shall destroy all information and records which he may have as to the identity of said donor it being the intention of all parties that the identity of said donor shall be and forever remain anonymous

We and each of us further covenant and agree to forever refrain from instituting, pressing or in any way aiding any claim demand action or cause of action for damages costs loss of services expense or compensation for or on account of or hereafter arising out of the premises hereinabove set forth

We and each of us further promise and agree to indemnify and save harmless the said Dr from any loss and/or expenses incurred by him in connection with the defense or payment of any claim or action arising out of the aforesaid premises or agreements herein contained

This agreement shall be binding upon ourselves and each of us our assigns heirs, executors and administrators

Dated this day of 19

(Husband)

(Wife)

WITNESSES

Relying upon the authorization and agreements above set forth I hereby agree to obtain a donor and to artificially inseminate the said

DATED this day of , 19

CONCLUSION

Distinct difference of opinion exists concerning the legality of heterologous artificial insemination and the legitimacy of children resulting therefrom Reconciliation of these opposite points of view is difficult The extent of a physician s responsibility in selecting a donor and performing this operation if it is performed, is uncertain

A physician before undertaking the procedure will act wisely if he advises the husband and wife as to the legal implications or uncertainties of the operation as it affects them as husband and wife and as it may affect the child s status at law

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

The Council has authorized publication of the following report to the Council submitted by Arthur M Walker M D Secretary of the Veterans Administration Committee on Streptomycin

R T STORMONT, M D *Secretary*

CHEMOTHERAPY OF TUBERCULOSIS IN MAN

PRESENT STATUS

This paper is essentially a progress report of the clinical study initiated by the Veterans Administration Army and Navy in June, 1946, and is a continuation of three reports published previously in these columns [1] The most recent of the three described the situation as it existed at the time of the Eighth Streptomycin Conference in November 1949 The present article carries the account forward to the Tenth Conference on the Chemotherapy of Tuberculosis in January 1951 During this interval the number of cases reported to the study has increased from 7 000 to approximately 10,000, the goal of recording data from individual cases on punch cards has, in some measure been achieved thus increasing the reliability of the data certain disadvantages of streptomycin have been partially overcome and the effects of some new chemotherapeutic agents have been explored in a preliminary fashion Hence this report Although it concerns itself primarily with the results of a single cooperative study the conclusions this report presents are believed to be compatible with those of the majority of the other investigators in the field

From the outset it has been unpleasantly clear that streptomycin does not "cure tuberculosis [2] Since the disease occurs in many forms and is chronic by nature perhaps this was not to be expected Although some patients with miliary or meningeal tuberculosis are alive who otherwise would be dead, and a large number of muco-cutaneous lesions have healed [1b] which, otherwise, scarcely would have done so, the central problem, a cure for pulmonary tuberculosis remains The aim of the investigation has been to extract the greatest possible benefit from the drugs at hand by overcoming their disadvantages and by employing them in combination with bed rest and appropriate surgical procedures If the infrequency with which streptomycin cures tuberculosis is disregarded for the moment two disadvantages remain the drug s toxicity, and the frequency with which strains of tubercle bacilli resistant to it appear during treatment Since the two difficulties apply to the reduction product, dihydrostreptomycin, as well as to the parent drug both antibiotics will be considered simultaneously in these respects

TOXICITY

The obvious way to diminish or avoid the toxic effects of a drug is to decrease its dosage To this truism however must be added another if the diminution in toxicity involves a concomitant reduction in therapeutic efficacy, the investigator must weigh the advantages of the one result against the disadvantages of the other Fortunately, this dilemma can be avoided for the most part in the present instance

Remarks on the toxicity of the two antibiotics under discussion can be confined, for all practical purposes, to their effect

upon the eighth cranial nerve Signs of renal irritation, skin eruptions, and fever occur occasionally in patients, and allergic phenomena may develop in nurses who handle the drugs, but both drugs are relatively non toxic except for their singular action on the vestibular and auditory apparatus Vertigo, accompanied usually by ataxia and by diminished response to caloric stimulation is the commonest toxic manifestation of streptomycin therapy It occurred, sometimes to an incapacitating extent, in 80% of 671 patients receiving 2 gm of the drug daily for 120 days [1b] Cutting down duration of treatment to 60 days reduced the incidence to 63%, but a reduction in dosage was even more successful Vertigo occurred in only 8% of 1,006 patients receiving a single daily injection of 1 gm per day, in 5 8% of 137 patients receiving 0 5 gm per day, and in 3 4% of 383 patients receiving 1gm twice a week (Table 13 [3a]) Each of these three regimens was continued for 120 days and in only two instances the vertigo was described as 'severe" or "incapacitating " Further—a point which will be discussed subsequently—these reductions in dosage were accomplished without any detectible loss of therapeutic efficacy This statement is made with reservations only for the 0 5 gm per day regimen

A second method of decreasing the incidence of vertigo, which began in the fall of 1948, involves substituting dihydrostreptomycin for streptomycin The advantage is very much in favor of dihydrostreptomycin at a dosage level of 2 gm per day [1b, c], but, since the study had already reached the conclusion that the daily dose of streptomycin need not exceed 1 gm per day, the advantage is more apparent than real At the lower dosage level, the difference is relatively slight (8% as opposed to 3%) [3b] For this reason and because, after a study of 800 cases, the advantage in therapeutic efficacy seemed to favor use of streptomycin the use of dihydrostreptomycin has been discontinued in the study Another factor which led to this decision was the discovery that dihydrostreptomycin was more prone to produce deafness which can occur even at a dosage of 1 gm per day if treatment be continued for longer than four months [4] According to Romansky [3b] and Glorig [3c] a loss of hearing exceeding 30 decibels occurred in 40% of 83 patients receiving 2 gm per day for less than four months This toxic reaction, as amazing in its specificity as the vertigo produced by streptomycin, is possessed to an even greater degree by hydroxystreptomycin (Hawkins [3c])

Some progress has been made, then, in controlling the toxic effects of streptomycin on the eighth cranial nerve by diminishing the amount and frequency of its administration, the most satisfactory regimen being 1 gm twice a week

DRUG RESISTANCE

The second disadvantage of streptomycin therapy is the frequency with which cultures of tubercle bacilli, obtained from patients, become inured to the drug and are able to grow in considerable concentrations of it It has been natural and reasonable to interpret this situation as indicating that all the tubercle bacilli in the patient s lungs (or eleswhere) are similarly resistant and that further treatment with streptomycin is useless This does not appear to be entirely true in man when the bacilli are resistant to 10 γ per cubic centimeter or even when they are partially resistant (i e, show less growth than in the control tube) to 100 γ per cubic centimeter (Table 1c [3c]) It is true however, in man when the bacilli are completely resistant to 100 γ per cubic centimeter or more and in guinea pigs at concentrations much less than this For the purposes of our present discussion, then, it may be accepted that the emergence of resistance is a disadvantage to streptomycin therapy

With the regimen first employed in this study, a daily dosage of 2 gm of streptomycin, 82% of all positive cultures were found resistant to 10 γ or more per cubic centimeter after 120 days of therapy As long as the duration was maintained at 120 days, this incidence could not be decreased by reducing the daily dosage to 1 or 0 5 gm [1b] The obvious expedient of decreasing the duration of treatment was therefore explored in a series of 6 regimens (employing streptomycin or dihydrostreptomycin) extending over 90, 60, and 42 days This last regimen reduced the incidence of resistance among positive cultures to approximately 45%,[1c] but this incidence is still uncomfortably high Also, the 42-day regimen was clearly inferior in therapeutic efficacy as gauged by x ray improvement and sputum conversion Reducing duration of treatment did not provide a satisfactory solution to the difficulty

Therefore, two other procedures were investigated by the study the concomitant use of *p* aminosalicylic acid (PAS) with streptomycin, and the use of 1 gm of streptomycin twice a week rather than daily, a regimen first used by Fitzsimons General Hospital The study has not found *p* aminosalicylic acid, given alone in a daily oral dosage of 12 gm, to be as effective for treating pulmonary tuberculosis as it has been reported by Swedish investigators, because moderate or 'marked' radiologic improvement occurred in 48% of 739 patients receiving streptomycin and in only 17% of 247 patients receiving *p* aminosalicylic acid [3c] In the figures just quoted, it could be argued properly that the scales had been weighted against *p* aminosalicylic acid, since the patients receiving it had already received a course of streptomycin and the necessity for further chemotherapy may well have indicated the presence of a more malignant type of disease However, there can be no doubt of the favorable effect exerted against the development of resistance to streptomycin by concomitant therapy with *p* aminosalicylic acid Thus, of 224 patients treated with the combined regimen, only 31% (instead of 82% treated with streptomycin alone) of those cultures which continued to be positive after 120 days of therapy were resistant to 10 γ or more per cubic centimeter of streptomycin [3c] The second procedure, that of decreasing the frequency of injections to twice a week, also met with some measure of success Resistant bacilli appeared more slowly and, after 120 days of therapy, 67% (rather than 82%) of 118 positive cultures were resistant by the same criteria (Tempel et al [3c])

Since both of these procedures seemed promising independently, the obvious indication was to use them both in "combined, intermittent therapy (i e, 1 gm of streptomycin twice weekly plus 12 gm of *p* aminosalicylic acid daily, given concurrently) Under these circumstances, the incidence of resistance among positive cultures decreased to 17% after 120 days of therapy (Table 12 [3c])

Several matters of some interest in connection with resistance may bear brief mention

1 Although resistance to *p* aminosalicylic acid develops, its incidence does not usually exceed 10% after 120 days of combined streptomycin and *p* aminosalicylic acid therapy (Table 12 [3c]) When *p* aminosalicylic acid is given alone (i e, in the absence of streptomycin), the incidence of resistance is about 45%

2 No attempt has yet been made by members of the study to determine the minimum effective dose of *p*-aminosalicylic acid, but Fitzsimons General Hospital has presented evidence favoring its daily rather than biweekly administration Patients have objected strenuously to attempts to increase the daily oral dosage to 18 or 24 gm [3c]

3 Since tubercle bacilli have been rendered resistant to streptomycin in so many patients and since this resistance is relatively permanent, it is surprising that so few other patients appear to have been infected by them This matter does not seem to pose the serious public health problem envisaged earlier

4 An increasing number of cases are being reported in which, some months or even years after cessation of streptomycin therapy and development of resistant bacilli, sensitive cultures have been obtained This no longer seems likely to be a laboratory error but rather an expression of the heterogeneity of the bacillary population with regard to streptomycin

In this matter of resistance, then, considerable progress has been made, most notably by using *p* aminosalicylic acid in combination with streptomycin, and also by injecting the latter drug less frequently Before these factors were introduced, incidence of resistance was about 82% to 10 γ per cubic centi

meter after 120 days of therapy, it is now less than 20% The incidence of resistance to 100 γ or more per cubic centimeter has been decreased from 62% to 5% by the same procedures

PULMONARY TUBERCULOSIS

The advances made in overcoming the factors of toxicity of, and bacterial resistance to, streptomycin would have been useless if accomplished at the expense of therapeutic efficacy Although passing reference to this point has already been made, it is of such outstanding importance that supporting data is supplied in Table 1 For simplicity in presentation the criteria have been confined to radiologic change and sputum conversion (by culture) a simplification justified by past experience The patients in regimen 1 (2 gm streptomycin daily) were treated in 1946 and 1947, whereas those in regimens 2 and 3 were treated in 1949 and 1950, and p aminosalicylic acid is absent from regimen 1 and present in the other regimens However, alternate patients were assigned to regimens 2 and 3 on the basis of hospital registration numbers and background factors (e g, race, age extent and trend of disease) in each group were carefully analyzed and proved satisfactorily similar The encouraging difference in incidence of sputum conversion is presumably due to the concomitant collapse therapy permitted with the last two regimens At any rate, there can be no doubt that the regimens in present use (2 and 3) have maintained the therapeutic efficacy of the earlier one which contained larger doses of streptomycin and did not include *p*-aminosalicylic acid

TABLE 1 —*Comparison of Therapeutic Efficacy of Three Regimens in Pulmonary Tuberculosis (at End of Therapy)*

Results	(1) 2 0 Gm Streptomycin Daily 120 Days		(2) 1 0 Gm Streptomycin Daily + 12 0 Gm PAS Daily 120 Days		(3) 1 0 Gm. Streptomycin Semiweekly + 12 0 Gm PAS Daily 120 Days	
	No Cases	Percentage	No Cases	Percentage	No Cases	Percentage
Radiologic improvement						
Moderate or marked	248	66	209	48	139	46
Slight	64	17	131	30	94	31
All degrees	312	83	340	78	233	77
Total cases observed	376	100	430	100	303	100
	No Cases Observed	Percentage Converted	No Cases Observed	Percentage Converted	No Cases Observed	Percentage Converted
Sputum conversion (culture)	120	32	316	69	200	50

The abbreviated data of Table 1 are all obtained at the 120 day point after the beginning of therapy No mention has been made of follow-up or of the relapses which occur in pulmonary tuberculosis Such information is beginning to become available Commander Canada and his collaborators have published a three year follow up of 202 cases in which the earliest regimen,[5] 2 gm of streptomycin daily for 120 days, was used They reported that 28% of the patients were dead, arrest or apparent arrest of disease had occurred in 40%, approximately one third of the survivors were gainfully employed, and one half were able to be up and about for nine hours or more per day The incidence of sputum conversion had increased to 50% after completion of therapy, and one half of the survivors who had exhibited vestibular disturbances during therapy continued to show some residuals, although in only 6% was it of sufficient degree to interfere with a gainful occupation In the absence of a comparable series of patients not treated with streptomycin, it is difficult to know precisely how these figures should be regarded but the fact that the disease was progressive in 84% (and improving in only 3%) at the time treatment was started, carries considerable weight in the judgment of the study It should be remarked that collapse procedures were used in approximately two-thirds of the cases following chemotherapy

Follow up data describing the effects of eight regimens on 813 cases during the preceding year (discussion of Table 1B [3c]) were presented before the conference of January 1951 Analysis was more competent than in previous series because background material was available and seemed satisfactorily comparable in each group Regimens enduring for 120 days appeared superior to those of 90 days On the other hand, little or no difference in therapeutic efficacy could be demonstrated by the substitution of interrupted (twice weekly) for daily therapy, or by substituting dihydrostreptomycin for streptomycin in equivalent (1 gm daily) dosage

The primary concern of the Veterans Administration Army-Navy study has been the comparative examination of regimens in an attempt to bracket the target and to gain maximum therapeutic efficacy with minimum toxic manifestations and bacterial resistance The investigators in the study were so thoroughly convinced that *p* aminosalicylic acid should always be given concomitantly with streptomycin that the latter drug has not been used alone (except in special circumstances) since the fall of 1949 The decision is not based on any increased effectiveness of the combined therapy during regimens of 120 days or less which indeed, has not been detectable but on delay in the development of resistant bacilli and, presumably consequent prolongation of the effective period of streptomycin This delay has raised the interesting and logical possibility of prolonging treatment for 8 or 12 months, or even more These prolonged regimens first used by the Veterans Administration Hospital at Sunmount N Y, have been the chief concern of the study since April, 1950 The initial results of this project have been very promising One of the most striking effects has been the difficulty in obtaining positive sputum cultures (i e, an increased incidence of sputum conversion) as long as the combined therapy was continued (Table 1A [3c]) It is, of course too early to make any precise statements on these matters but it is the opinion of the study group that the use of prolonged regimens should be seriously considered

EXTRAPULMONARY TUBERCULOSIS

The indications for the use and success of chemotherapy in extrapulmonary tuberculosis have not changed recognizably in the past year Therefore, they deserve no place in a capsule summary With two exceptions to be mentioned, the study group no longer collects data on current experience in these fields and has abolished its protocols The comments previously made [1b] are believed still applicable if combined with the suggested adjustments in dosage

1 *Miliary and Meningeal Tuberculosis*—Although mortality from these infections is highest in the first year after their diagnosis an appreciable number of deaths from relapses following meningitis and, usually, from the development of complicating meningitis following miliary tuberculosis occurs during the second year An evaluation of therapy is therefore scarcely justified before expiration of a two-year period This was pointed out by Bunn [6] in a two-year follow-up of the first 100 patients treated in this study At the time of his presentation the survival rate was 58% in 19 cases of miliary tuberculosis unaccompanied by meningitis and 20% in 43 cases of tuberculosis meningitis Both groups are exceedingly small and the results are inferior to many series reported from abroad and by Lincoln for example in this country In some series the discrepancy may be due to an inadequate follow up and in others to the fact that the patients were mostly or entirely children But there is no agreement on this matter and members of the conferences have never felt sufficiently sure of themselves to formulate any exact protocol for the treatment of these types of tuberculosis Consequently, the investigators have used a wide variety of regimens making statistical analysis difficult Little has been learned although during the past year or two *p* aminosalicylic acid has been used in combination with streptomycin or dihydrostreptomycin with some improvement in immediate results

(Table 2) The data in Table 2 cover only one year after the start of treatment After a year's treatment the advantage of combined therapy appears to be much less (Table 9[3c]), although the number of cases is insufficient to warrant a definite statement on this point However, the conference group of January, 1951, felt justified in making combined therapy obligatory in future treatment, even to the extent of advising parenteral administration of p aminosalicylic acid if the drug could not be given by mouth

The intrathecal use of tuberculin in the treatment of meningitis, suggested and practiced by Smith and Cairns of Oxford, was discussed at some length in the conference [3c] The most recent account of this procedure was presented before the National Tuberculosis Association by Smith in April, 1951 Although it was agreed that the results were striking, members of the conference felt that the procedure was too hazardous to warrant their making any recommendation at this time

2 *Genitourinary Tuberculosis*—The only data in this field which it has seemed necessary to collect for recent conferences are those dealing with bacteriologic follow up One hundred and twenty-three patients in the series now have been observed for more than one year since the completion of a first course of chemotherapy and 100 for more than two years In an attempt to clarify interpretation of the data, the lesions were classified under renal only,' 'genital only," and 'combined renal and genital" Data on five regimens were presented to the conference of January, 1951 (Table 8 [3c]) The outstanding finding (by culture or guinea pig) was that the conversion of urine from positive to negative had withstood the passing of time surprisingly well In the renal lesions there was a drop from 53% (immediately after treatment) to 47% (more than two years later), in genital lesions from 78% to 70%, and in combined lesions from 50% to 33% The 2 gm of streptomycin daily seemed slightly more effective than 1 gm daily, and the 42-day appeared definitely less effective than the 120-day regimen Data on the combined regimens were insufficient to determine whether any advantage had been gained by the addition of *p*-aminosalicylic acid The conference members decided, as they had for pulmonary tuberculosis, to extend the duration of treatment beyond 120 days and to explore the effect of the interrupted (twice a week), combined streptomycin and *p*-aminosalicylic acid schedule

PROTECTION IN THORACIC SURGERY

Early in the course of this study, the protective effect of streptomycin against postoperative extensions of infection was studied by use in alternate cases of thoracoplasty for seven days prior, and 14 days subsequent, to operation This study was discontinued in April, 1948, not because the effect of streptomycin in decreasing the incidence of complications did not seem clear but because their incidence in untreated patients was too low to justify the procedure [1b] Use of streptomycin was continued, however, in all patients subjected to pulmonary excisions and decortications At first the procedure seemed highly satisfactory,[1b] but subsequently, despite its continuance, the incidence of complications increased from twofold to fourfold [1c] The indications for resectional surgery have unquestionably been broadened during the past three years to include many cases that would have been regarded as impossibly "bad risks" before the advent of chemotherapy and improved surgical techniques In this extension of surgery may lie the explanation for the increase in complications But the question also arose as to whether deterioration in results was due to streptomycin s being administered to patients who had received a previous course of the drug and whose bacilli were therefore resistant to it Data presented to the conference of January, 1951 (Table 11 [3c]), and summarized in Table 3 of this paper, indicate that this is only partially true Thus, although results were manifestly inferior in patients with bacilli resistant to streptomycin at the time of prophylactic chemotherapy, they were somewhat inferior in those with bacilli still sensitive to concentrations of less than 10 γ per cubic centimeter despite a previous course of the drug Two negative statements, neither of them satisfying, are warranted 1 The increased incidence of postoperative complications in this study since 1948 is not wholly due to previous chemotherapy 2 Insofar as this increase in complications is associated with previous chemotherapy, it is not wholly due to the presence of resistant bacilli prior to surgery, although it may well be that the bacilli of patients treated prior to surgery become resistant more rapidly than do those from patients who received no previous chemotherapy

THERAPY WITH SUBSTANCES OTHER THAN STREPTOMYCIN OR DIHYDROSTREPTOMYCIN

Late in 1948, it was stated that it "would be strange if the first antibiotic that proved to be bacteriostatic in the treatment of human tuberculosis were to be the best '[8] However, this is precisely what has happened thus far There is no lack of rivals, but, according to the results of the study, streptomycin still leads the field by the widest of margins Nonetheless, other antibiotics deserve some brief mention

1 *Other Antibiotics*—Neomycin, viomycin, and mycomycin are of peculiar interest, because their in vitro activity is specific for acid-fast microorganisms and because they are effective against tubercle bacilli that have become resistant to streptomycin Neomycin has had some clinical trial and, in the purest preparations available, has proved not only to be a renal irritant but also to be highly toxic to the cochlear branch of the eighth cranial nerve In two small series reported to the conference of January, 1951, 10 of 18 patients were said to have become totally deaf and a similar experience was reported in a larger series of 43 cases [3c] Viomycin has been employed in 49 cases of pulmonary tuberculosis in seven clinics (five of which are outside the study) [9] A preliminary report to the conference of January, 1951, indicated viomycin to be less effective and more toxic than streptomycin [3c] Since one of its toxic effects is on the eighth nerve, it seems unlikely that it will be useful as adjunctive therapy with streptomycin Mycomycin is still in the

laboratory development stage, the chief difficulty encountered being concerned with its stability at room temperature[3b,c] Although progress is being made, it would still be almost necessary to have the patient inside a deep-freeze with the drug if a clinical trial were to be made

Unlike the three antibiotics just mentioned, aureomycin and terramycin have relatively little tuberculostatic activity in vitro, but, because they are somewhat effective under these circumstances and relatively nontoxic, clinical trials appeared justified (These trials, like numerous others, including one calling for the single weekly injection of 2 gm of streptomycin initiated by the Navy, are referred to as pilot studies and are regarded as one of the most useful functions of the study Hospitals are asked to participate, and thus it becomes possible to collect preliminary data on a considerable number of matters for the guidance of future conferences) For aureomycin, only one hospital was involved and only 10 patients were treated, but the selection of patients was such that it seemed permissible to conclude that the effects were no more beneficial than could have been expected from bed rest alone[3a] To the conference of January, 1951, six hospitals reported on a pilot study with terramycin The study had been in progress for approximately six months, and 62 patients had been treated There was some disagreement concerning results, as five hospitals were thoroughly unimpressed whereas one (Fitzsimons) felt that a beneficial effect had been observed and, furthermore, that the emergence of resistance to streptomycin appeared to be suppressed or delayed when the two drugs were given concurrently[3c]

2 *Hormones* — A modest symposium on corticotrophin (ACTH) and cortisone was held during the conference of January, 1951[3c] The rabbit was added to the previous three laboratory animals (mouse,[10] guinea pig,[11] rat[12]) in which definitely harmful effects were proved to have been exerted by these hormones in the presence of experimental tuberculosis The lesions were more extensive, more numerous, and death occurred earlier than in untreated control animals In the course of general discussion, approximately 20 cases of clinical tuberculosis were reported in which, after the anticipated initial symptomatic improvement, the end results of treatment were unfavorable Tuberculosis seems to be another of the infectious diseases in which these hormones provide a physiological tool rather than a therapeutic weapon (Finland[3c]) Although the conference group does not seek to advise the medical profession, it felt justified in endorsing the statement of the National Tuberculosis Association that these hormones should not be used in patients with active tuberculosis and that they be used with extreme caution in human beings with possibly latent tuberculous infection until further investigative work has shown that such administration may be safe "[13]

3 *Miscellaneous* —Amithiozone (tibione®) is the only thiosemicarbazone with which the study group has had experience, and this experience has not been altogether satisfactory It was employed at a daily dosage of 0 2 gm in 226 cases of pulmonary tuberculosis of which approximately one half were resistant to streptomycin Although some patients, including those resistant to streptomycin, showed considerable radiologic improvement after four months' therapy, the incidence was much less than that obtained with other regimens (Tables 1C and D[3c]) Also, amithiozone's toxicity greatly exceeded either that of streptomycin or *p*-aminosalicylic acid, so that it was necessary to stop treatment in one-third of the cases The chief toxic manifestations of amithiozone are liver damage (proved by biopsy) and blood dyscrasias, particularly a fall in hemoglobin Although both of these lesions seem to be reversible, their existence leaves doubt as to the wisdom of amithiozone therapy The study is to be continued on a smaller basis, with a daily dosage of 0 1 gm , in the hope of diminishing or avoiding these toxic effects

Cepharanthin is an alkaloid used widely in Japan during recent years for treating tuberculosis and leprosy Although the reports are more enthusiastic than critical, laboratory work in this country has indicated that it does not warrant a clinical trial[14]

p-Aminosalicylic acid, already discussed at as great a length as this type of presentation permits, is mentioned again to cite the fact that pilot studies intended to minimize its untoward effects on the gastrointestinal tract by the use of a variety of capsules and granules have been unsuccessful Four grams is being given three times daily in solution as the sodium salt with meals without too much difficulty

Benemid does not affect tuberculosis It is being employed in a pilot study to determine its effect on the serum concentrations of *p* aminosalicylic acid

SUMMARY

The series of cases of tuberculosis studied by the Veterans Administration, Army, and Navy has increased to about 10,000 For obvious reasons, no attempt is being made to summarize this series here Rather, an attempt is made to report on the progress of the study, since a somewhat similar report to the Council on Pharmacy and Chemistry was published in March, 1950 The summary can be made in four sentences, the first two containing good tidings, the last two containing, respectively, dubious and bad tidings

[14] Personal communications from Drs William H Feldman Lawrence B Hobson, and William Steenken Jr

1. Reducing the dosage of streptomycin to 1 gm., either daily or twice a week, has reduced toxicity without impairing therapeutic efficacy.

2. The concomitant daily administration of p aminosalicylic acid has definitely delayed the emergence of streptomycin-resistant tubercle bacilli and has thereby made possible the desired continuation of effective therapy beyond four months, a procedure that is now being explored.

3. Preliminary observations indicate that concomitant administration of p aminosalicylic acid and streptomycin may have further increased the survival rate of patients with meningeal or miliary tuberculosis.

4. Although many antibiotics and other drugs have been studied during the past 18 months, and although several of them undoubtedly have some bacteriostatic action on tubercle bacilli, none of them promises a favorable comparison with streptomycin, much less of being the "wonder drug" frequently mentioned by the press.

BUREAU OF MEDICAL ECONOMIC RESEARCH

MEDICAL CARE PRICES AND THE COST OF LIVING

Frank G. Dickinson, Ph.D., Chicago

Again, in 1950 the Consumers' Price Index, compiled by the United States Bureau of Labor Statistics, was higher than the index of the prices of medical care items. The Consumers' Price Index, which measures monthly the changes since 1935-1939 in the prices of fixed quantities of goods and services normally purchased by moderate income families in large cities, stood at 171.9 (adjusted), the index of medical care and drugs, a small part of the Consumers' Price Index, was 147.9 (unadjusted). The base period 1935-1939 equals 100.

According to these indexes, which are considered our best general measure of the purchasing power of the consumer's dollar, the price of medical care has risen 48% since 1935-1939 while the general cost of living has risen 72%. Stated another way, a dollar in the base period could buy a dollar's worth of medical care or a dollar's worth of all the goods and services priced for the Consumers' Price Index, a dollar in 1950 could buy only 58 cents' worth (58.2) of all goods and services but 68 cents' worth (67.6) of medical care. Thus, in terms of the purchasing power of the dollar, medical care was 14% cheaper in 1950 than in 1935-1939 (58.2¢/67.6¢ = 86% or 147.9/171.9 = 86%).

In the accompanying table, the Consumers' Price Index is presented along with the price indexes of the medical care items for the years 1947 through 1950.[1] The index of medical care and drugs is divided into two main parts—(I) Medical care, excluding drugs and (II) Prescriptions and drugs. For 1950 the index of medical care excluding drugs was 153.1, the index of prescriptions and drugs was 124.8. The index of physicians' fees (general practitioner, surgeon, specialist) was 140.0, of general practitioners' fees, 139.8, and of surgeons' and specialists' fees, 140.6. The index of dentists' fees was 154.3 and the highest index, 235.3, was for hospital rates. Thus, with the exception of hospital rates, the prices of individual medical care items have risen considerably less than the Consumers' Price Index.

As explained in earlier publications,[1] the high hospital rate index reflects the fact that hospitals are singularly exposed to the forces of inflation. It also must be realized that the period 1935-1939, while generally accepted by economists as a relatively normal period for the purposes of general statistical comparison, is not an equally good base in the case of every item. There is reason to believe that it is a somewhat less appropriate base to use for the measure of the increase in hospital rates. The eight hour day for nurses in hospitals was first introduced during the early 1930's, but it was not until the late 1930's and early 1940's that it prevailed in most hospitals. Thus, this change in the working day of nurses, which would considerably affect the labor costs of hospitals, was not fully accomplished until after the base period. Other developments, however, might have counterbalanced this one factor. Complete examination of all the factors affecting the choice of a base period is beyond the scope of this article.

The Consumers' Price Index and Price Indexes for Medical Care for Moderate Income Families in Large Cities, for the Years 1947-1950

S. Bureau of Labor Statistics.

* See text for explanation.

† Subject to revision.

The relatively small increase in the price of physicians' services in an inflationary era is to be expected. These prices are influenced by custom and are not as sensitive to changes in the economy as are the prices of most goods and services—particularly those whose prices must cover the costs of many other items used in their production. Physicians' fees belong to a class known as "sticky" prices; they move neither up nor down as rapidly or as far as other prices. The economic position of the physician, however, becomes adjusted to changes in the rest of the economy in other ways. Thus, while physicians' fees had not increased as much as other prices by 1949 the physician's collections had become so much better and his "output" so much greater that his over-all income had increased since 1935-1939

Director, Bureau of Medical Economic Research.

This article was prepared with the assistance of Janice Oberman, Research Assistant, American Medical Association Bureau of Medical Economic Research; Ewan Clague, Commissioner of Labor Statistics, and Ethel D. Hoover, Chief, Branch of Consumers' Prices, Bureau of Labor Statistics, United States Department of Labor.

[1] This table is an extension of the tables on medical price indexes in the following publications of the Bureau of Medical Economic Research, American Medical Association: Bulletin 62, Comparative Increases in the Costs of Medical Care and in the Costs of Living, 1948; Bulletin 66, The Cost and Quantity of Medical Care in the United States, 1948; Medical Care Prices vs. Cost of Living, J. A. M. A. 139: 591 (Feb. 26) 1949, reprinted in Bulletin 67, Four Recent Articles on Medical Economics, 1949; Medical Care Prices vs. Cost of Living, J. A. M. A. 143: 1198 (July 29) 1950, reprinted as Bulletin 76, 1950.

just about as much as the national income per capita[2] In order for the physician to retain the same economic position in a time of rapidly changing price levels, it is not necessary for him to change his price to the extent that other prices have changed.

It should always be kept in mind that an index of prices measures *changes* in the level of prices but does not indicate the level itself for any year or for the base period The significance and applicability of the Consumers Price Index and the indexes of the individual items may be somewhat limited by the fact that the prices represented are those for goods and services purchased by moderate income families in 34 large cities To the extent that the rise, percentagewise, in prices of goods purchased by low and high income families in all cities corresponds with the price rise, percentagewise of goods for the moderate income families in the 34 cities, the indexes reflect price changes for goods purchased by all persons in the United States Despite these technical limitations this Index is considered the best measure of changes in purchasing power and is widely used to compute cost-of living wage and salary adjustments

For the past few years the Bureau of Labor Statistics has been engaged in preparations for a large scale revision of its price indexes This revision is designed to modernize the indexes so that they will reflect certain population changes and changes in the buying habits of the American people It was recognized that many goods which have become an important part of the budget of the moderate income consumer were not priced or did not exist when the items for pricing were originally selected and that the distribution of weights among the various items has changed considerably during the past few years In the medical care field, for example, the wonder drugs and the extra services in hospitals, which have become such an important part of medical care, were not included in pricing medical care items As a preliminary phase of the general revision which is scheduled to be completed by the middle of 1952, the Bureau of Labor Statistics has undertaken a study to determine the individual goods and services to be included in the revised index

Originally, no important changes were to be made in the indexes until the general revision was finished With the outbreak of the fighting in Korea, however the sharp and diverse price movements and the need for economic stabilization made it necessary to have as accurate a measure of prices as possible The Bureau of Labor Statistics, therefore, introduced certain immediate improvements and adjustments No changes in basic concepts or methodology will be made until the final revision The present adjustments consist chiefly of a revision of city population weights based on the 1950 census a correction of the new unit bias" in the rent index the addition of new items, and a revision of commodity weights These adjustments have already been made in the calculation of the Consumers Price Index The indexes for the individual medical care items have not yet been adjusted[3] Since the adjusted Consumers Price Index is the best measure of price change it is shown in our table (row 1) in place of the former unadjusted data The unadjusted data have been inserted in parentheses in the second row merely for purposes of comparison, these are slightly lower than the adjusted series

It is believed that these adjustments and particularly the changes to be made in the final revision of the Index will considerably improve the representativeness of the Index The Bureau of Medical Economic Research has previously expressed its appreciation of the cooperation shown by physicians, dentists, and hospital administrators in providing the field representatives of the Department of Labor with information regarding fee schedules and charges In view of the important changes to be made in the Index and the great usefulness of these data to the Bureau it is hoped that these groups will continue to show their cooperation

---

[2] Dickinson F G., and Bradley C. E Survey of Physicians Incomes J A M A 146:1249 (July 28) 1951 Reprinted as Bulletin 84 Bureau of Medical Economic Research American Medical Association 1951

[3] The 1950 index for medical care and drug items was not revised when the all items index was adjusted because the same price relatives for individual items were used in both the adjusted and unadjusted series

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

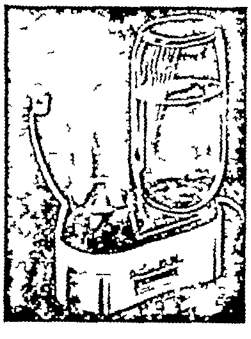
The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports

RALPH E DE FOREST, M.D., *Secretary*

ELECTRESTEEM VAPORIZERS ACCEPTED

Manufacturer Electric Steam Radiator Corporation, 1 Electric Ave, Paris, Ky

The Electresteem Vaporizers, Models 10 24 hour Standard and 10 24 hour DeLuxe, are devices for humidifying rooms by heating water and discharging the vapor The water is heated directly by the passage of an alternating current and is thus evaporated The heater requires a source of 60 cycle current at 115 volts and draws 350 watts The generation of heat and liberation of vapor takes place in a small chamber somewhat removed from the main water reservoir, so that only a small amount of water is hot at any given time and the liberation of vapor begins very soon after the electricity is turned on It will raise the humidity in a small room more than one unit must be used for a large room



Electresteem Vaporizer

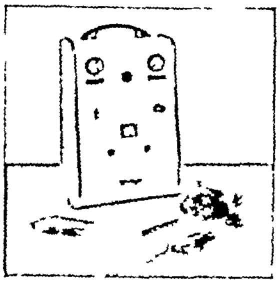
The specimen submitted by the firm was designed to hold a one gallon glass jar (3 780 cc) Its overall dimensions are 27 by 27 by 12 cm (10¾ by 10¾ by 4¾ in) and it weighs 1 25 kg (2¾ lb) Prepared for shipping it measures 28 by 28 by 13 cm (11 by 11 by 5 in) and weighs 1 4 kg (3 lb)

Laboratory measurements and evidence from other acceptable sources indicated that the device performed as represented by the manufacturer The device is listed by Underwriters Laboratories, Inc The Council on Physical Medicine and Rehabilitation voted to include the Electresteem Vaporizers, Models 10 24 hour Standard and 10 24 hour DeLuxe, in its list of accepted devices

PEERLESS HIGH FREQUENCY EPILATION UNIT, NO 108, ACCEPTED

Manufacturer Peerless X-Ray Laboratories & Mfg Corp, 467 Tenth Ave, New York 18

The Peerless High Frequency Epilation Unit No 108 is a device intended for use in the removal of superfluous hairs The dimensions are 43 by 27 by 20 cm (17 by 10½ by 8 in) and the weight is 8 6 kg (19 lb) Packed for shipment it measures 51 by 25 by 30 cm (20 by 10 by 12 in) and weighs 11 4 kg (25 lb) The foreign shipping weight is 18 kg Accessories not included in these shipping weights, are a footswitch hand electrode electrode wire needle holder and a dozen needles The device requires a source of 50 to 60 cycle alternating current at 110 or 220 volts and draws 50 watts of power A previous model was accepted by the Council and the acceptance was announced in THE JOURNAL of September 14 1946



Peerless High Frequency Epilation Unit No 108

Evidence from sources acceptable to the Council indicated that the device was soundly constructed and performed as represented by the manufacturer The Council on Physical Medicine and Rehabilitation voted to include the Peerless High Frequency Epilation Unit No 108 in its list of accepted devices

1 Reducing the dosage of streptomycin to 1 gm , either daily or twice a week, has reduced toxicity without impairing therapeutic efficacy

2 The concomitant daily administration of p-aminosalicylic acid has definitely delayed the emergence of streptomycin-resistant tubercle bacilli and has thereby made possible the desired continuation of effective therapy beyond four months, a procedure that is now being explored

3 Preliminary observations indicate that concomitant administration of p aminosalicylic acid and streptomycin may have further increased the survival rate of patients with meningeal or miliary tuberculosis

4 Although many antibiotics and other drugs have been studied during the past 18 months, and although several of them undoubtedly have some bacteriostatic action on tubercle bacilli, none of them promises a favorable comparison with streptomycin, much less of being the "wonder drug" frequently mentioned by the press

MEDICAL CARE PRICES AND THE COST OF LIVING

Frank G Dickinson, Ph D , Chicago

Again, in 1950 the Consumers' Price Index, compiled by the United States Bureau of Labor Statistics, was higher than the index of the prices of medical care items The Consumers' Price Index, which measures monthly the changes since 1935-1939 in the prices of fixed quantities of goods and services normally purchased by moderate-income families in large cities, stood at 171 9 (adjusted), the index of medical care and drugs, a small part of the Consumers' Price Index, was 147 9 (unadjusted) The base period 1935-1939 equals 100

According to these indexes, which are considered our best general measure of the purchasing power of the consumer's dollar, the price of medical care has risen 48% since 1935-1939 while the general cost of living has risen 72% Stated another way, a dollar in the base period could buy a dollar's worth of medical care or a dollar s worth of all the goods and services priced for the Consumers' Price Index, a dollar in 1950 could buy only 58 cents worth (58 2) of all goods and services but 68 cents' worth (67 6) of medical care Thus, in terms of the purchasing power of the dollar, medical care was 14% cheaper in 1950 than in 1935 1939 (58 2¢/67 6¢ = 86% or 147 9/171 9 = 86%)

In the accompanying table, the Consumers' Price Index is presented along with the price indexes of the medical care items for the years 1947 through 1950 [1] The index of medical care and drugs is divided into two main parts—(I) Medical care, excluding drugs and (II) Prescriptions and drugs For 1950 the index of medical care excluding drugs was 153 1, the index of prescriptions and drugs was 124 8 The index of physicians' fees (general practitioner, surgeon, specialist) was 140 0, of general practitioners' fees, 139 8, and of surgeons' and specialists fees, 140 6 The index of dentists' fees was 154 3 and the highest index, 235 3, was for hospital rates Thus, with the exception of hospital rates, the prices of individual medical care items have risen considerably less than the Consumers' Price Index

As explained in earlier publications,[1] the high hospital rate index reflects the fact that hospitals are singularly exposed to the forces of inflation It also must be realized that the period 1935-1939, while generally accepted by economists as a relatively normal period for the purposes of general statistical comparison, is not an equally good base in the case of every item There is reason to believe that it is a somewhat less appropriate base to use for the measure of the increase in hospital rates The eight hour day for nurses in hospitals was first introduced during the early 1930 s, but it was not until the late 1930 s and early 1940 s that it prevailed in most hospitals Thus, this change in the working day of nurses, which would considerably affect the labor costs of hospitals, was not fully accomplished until after the base period Other developments, however, might have counterbalanced this one factor Complete examination of all the factors affecting the choice of a base period is beyond the scope of this article

The Consumers' Price Index and Price Indexes for Medical Care for Moderate-Income Families in Large Cities, for the Years 1947-1950

(1935-1939 = 100)

	1947	1948	1949	1950
Consumers Price Index (cost of living) (Unadjusted)*	159 6 (159.2)	171 9 (171 2)	170 2 (169 1)	171.9 (171.2)

† Subject to revision

The relatively small increase in the price of physicians services in an inflationary era is to be expected These prices are influenced by custom and are not as sensitive to changes in the economy as are the prices of most goods and services—particularly those whose prices must cover the costs of many other items used in their production Physicians' fees belong to a class known as 'sticky prices, they move neither up nor down as rapidly or as far as other prices The economic position of the physician, however, becomes adjusted to changes in the rest of the economy in other ways Thus, while physicians' fees had not increased as much as other prices, by 1949 the physician s collections had become so much better and his output" so much greater that his over all income had increased since 1935 1939

Director Bureau of Medical Economic Research

This article was prepared with the assistance of Janice Oberman, Research Assistant American Medical Association Bureau of Medical Economic Research Ewan Clague Commissioner of Labor Statistics and Ethel D Hoover Chief Branch of Consumers Prices Bureau of Labor Statistics United States Department of Labor

[1] This table is an extension of the tables on medical price indexes in the following publications of the Bureau of Medical Economic Research American Medical Association Bulletin 62 Comparative Increases in the Costs of Medical Care and in the Costs of Living 1948 Bulletin 66 The Cost and Quantity of Medical Care in the United States 1948 Medical Care Prices vs Cost of Living J A M A **139**:591 (Feb 26) 1949 reprinted in Bulletin 67 Four Recent Articles on Medical Economics 1949 Medical Care Prices vs Cost of Living J A M A **143**:1198 (July 29) 1950 reprinted as Bulletin 76 1950

just about as much as the national income per capita[2] In order for the physician to retain the same economic position in a time of rapidly changing price levels it is not necessary for him to change his price to the extent that other prices have changed

It should always be kept in mind that an index of prices measures *changes* in the level of prices but does not indicate the level itself for any year or for the base period The significance and applicability of the Consumers Price Index and the indexes of the individual items may be somewhat limited by the fact that the prices represented are those for goods and services purchased by moderate income families in 34 large cities To the extent that the rise, percentagewise in prices of goods purchased by low and high income families in all cities corresponds with the price rise, percentagewise, of goods for the moderate income families in the 34 cities, the indexes reflect price changes for goods purchased by all persons in the United States Despite these technical limitations this Index is considered the best measure of changes in purchasing power and is widely used to compute cost-of living wage and salary adjustments

For the past few years the Bureau of Labor Statistics has been engaged in preparations for a large scale revision of its price indexes This revision is designed to modernize the indexes so that they will reflect certain population changes and changes in the buying habits of the American people It was recognized that many goods which have become an important part of the budget of the moderate income consumer were not priced or did not exist when the items for pricing were originally selected and that the distribution of weights among the various items has changed considerably during the past few years In the medical care field, for example the wonder drugs and the extra services in hospitals, which have become such an important part of medical care, were not included in pricing medical care items As a preliminary phase of the general revision, which is scheduled to be completed by the middle of 1952, the Bureau of Labor Statistics has undertaken a study to determine the individual goods and services to be included in the revised index.

Originally, no important changes were to be made in the indexes until the general revision was finished With the outbreak of the fighting in Korea, however, the sharp and diverse price movements and the need for economic stabilization made it necessary to have as accurate a measure of prices as possible The Bureau of Labor Statistics therefore, introduced certain immediate improvements and adjustments No changes in basic concepts or methodology will be made until the final revision The present adjustments consist chiefly of a revision of city population weights based on the 1950 census, a correction of the new unit bias" in the rent index the addition of new items, and a revision of commodity weights These adjustments have already been made in the calculation of the Consumers Price Index The indexes for the individual medical care items have not yet been adjusted[3] Since the adjusted Consumers Price Index is the best measure of price change, it is shown in our table (row 1) in place of the former unadjusted data The unadjusted data have been inserted in parentheses in the second row merely for purposes of comparison, these are slightly lower than the adjusted series

It is believed that these adjustments and particularly the changes to be made in the final revision of the Index will considerably improve the representativeness of the Index The Bureau of Medical Economic Research has previously expressed its appreciation of the cooperation shown by physicians, dentists, and hospital administrators in providing the field representatives of the Department of Labor with information regarding fee schedules and charges In view of the important changes to be made in the Index and the great usefulness of these data to the Bureau it is hoped that these groups will continue to show their cooperation

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

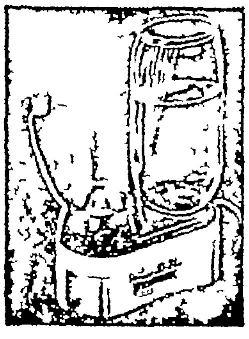
The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports

RALPH E DE FOREST, M.D., *Secretary*

ELECTRESTEEM VAPORIZERS ACCEPTED

Manufacturer Electric Steam Radiator Corporation, 1 Electric Ave, Paris, Ky

The Electresteem Vaporizers, Models 10 24 hour Standard and 10-24 hour DeLuxe, are devices for humidifying rooms by heating water and discharging the vapor The water is heated directly by the passage of an alternating current and is thus evaporated The heater requires a source of 60 cycle current at 115 volts and draws 350 watts The generation of heat and liberation of vapor takes place in a small chamber somewhat removed from the main water reservoir so that only a small amount of water is hot at any given time and the liberation of vapor begins very soon after the electricity is turned on It will raise the humidity in a small room more than one unit must be used for a large room



Electresteem Vaporizer

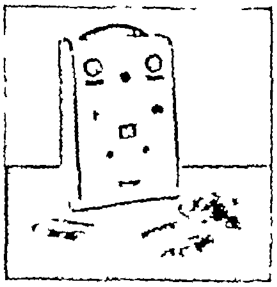
The specimen submitted by the firm was designed to hold a one gallon glass jar (3,780 cc) Its over all dimensions are 27 by 27 by 12 cm (10¾ by 10¾ by 4¾ in) and it weighs 1 25 kg (2¾ lb) Prepared for shipping it measures 28 by 28 by 13 cm (11 by 11 by 5 in) and weighs 1 4 kg (3 lb)

Laboratory measurements and evidence from other acceptable sources indicated that the device performed as represented by the manufacturer The device is listed by Underwriters Laboratories, Inc The Council on Physical Medicine and Rehabilitation voted to include the Electresteem Vaporizers, Models 10 24 hour Standard and 10 24 hour DeLuxe, in its list of accepted devices

PEERLESS HIGH FREQUENCY EPILATION UNIT, NO 108, ACCEPTED

Manufacturer Peerless X Ray Laboratories & Mfg Corp, 467 Tenth Ave, New York 18

The Peerless High Frequency Epilation Unit No 108, is a device intended for use in the removal of superfluous hairs The dimensions are 43 by 27 by 20 cm (17 by 10½ by 8 in) and the weight is 8 6 kg (19 lb) Packed for shipment it measures 51 by 25 by 30 cm (20 by 10 by 12 in) and weighs 11 4 kg (25 lb) The foreign shipping weight is 18 kg Accessories not included in these shipping weights are a footswitch hand electrode electrode wire needle holder and a dozen needles The device requires a source of 50 to 60 cycle alternating current at 110 or 220 volts and draws 50 watts of power A previous model was accepted by the Council and the acceptance was announced in THE JOURNAL of September 14 1946



Peerless High Frequency Epilation Unit No 108

Evidence from sources acceptable to the Council indicated that the device was soundly constructed and performed as represented by the manufacturer The Council on Physical Medicine and Rehabilitation voted to include the Peerless High Frequency Epilation Unit, No 108 in its list of accepted devices

[2] Dickinson F G and Bradley C E Survey of Physicians Incomes J A M A 146 1249 (July 28) 1951 Reprinted as Bulletin 84 Bureau of Medical Economic Research American Medical Association 1951

[3] The 1950 index for medical care and drug items was not revised when the all items index was adjusted because the same price relatives for individual items were used in both the adjusted and unadjusted series.

macrophages, so that more of the inhaled bacilli are retained than in the control This belief was confirmed by a quantitative study of splenic and hepatic phagocytosis of carbon particles following intravenous injection of india ink A similar increase in pulmonary retention of tubercle bacilli had been previously noted in genetically resistant rabbits [4] The increased phagocytosis, however, does not mean an increased destruction of the bacilli

While the number of pulmonary tubercles was much greater in the treated animals, each tubercle was much smaller than in the control In the control rabbits the individual tubercles averaged 5 5 mm in diameter, while the average in the cortisone-treated rabbits was about 2 5 mm The tubercles in the cortisone-treated animals were swarming with bacilli, while the control tubercles contained relatively few micro-organisms Moreover, the spread of the disease to the regional lymph nodes and to other parts of the body was markedly reduced in the treated animals In this respect, also, the reaction of the cortisone-treated susceptible rabbits was similar to that of the genetically resistant strain, in which tuberculosis develops earlier but which survive longer and have a more localized disease

CANCER TEACHING IN MEDICAL SCHOOLS

The emphasis now placed on cancer in medical schools has prompted the need for assessment of the relative effectiveness of various teaching methods and the effectiveness of medical educational programs in general The examination was originally prepared at the University of California in order to evaluate the program for bettering cancer teaching in the medical school [1] In view of the promising results obtained, a similar test on a nation-wide scale was undertaken in 1949 in consultation with, and with the financial support of, the National Cancer Institute The test was given to 9,358 students in 32 four-year medical schools in the United States [2]

The test was of the objective type and consisted of 180 five-choice, multiple-response items which varied greatly in complexity Efforts were made to sample the whole field of cancer and to avoid controversial matters The results showed wide differences between the average scores of students from school to school, the differences tending to increase with each succeeding class year The subject matter was analyzed and the items grouped according to the department of the school considered most responsible for teaching the information tested These departments were then furnished information indicating how their students answered the questions as compared with all students at a similar academic level The report reveals that many students graduating today lack important knowledge concerning the diagnosis and treatment of cancer The results of the test have already proved of benefit in the planning of cancer teaching programs, but only if the tests are given several times can changes in cancer learning be measured Present plans call for the readministration of the test in all cooperating schools each year for five years It is hoped that this will give some measure of the gain in student knowledge resulting from the education programs in medical schools throughout the country

NEUROLOGICAL "FEEDING CENTERS"

Hetherington [1] and others have demonstrated the existence in rats of a hypothalamic nucleus whose destruction leads to a marked increase in food intake, with resulting obesity This nucleus thus apparently acts as a dietary inhibitor A second center, which appears to be primarily a feeding center, is currently described by Anand and Brobeck [2] of Yale University The Yale physiologist tested the effects on food intake of small electrolytic lesions placed by the Horsley-Clarke instrument in other areas of the hypothalamus Two well-localized areas were found, destruction of both areas was followed by a complete absence of food intake even to the point of death by starvation After a destruction of one of these foci, rats continue to eat, even if previously made hyperphagic by destruction of the inhibiting nucleus

The nutritional or hormonal factors serving as primary stimulants of these feeding centers have not been determined Mayer [3] of Harvard University has suggested that blood sugar acts as the primary hormonal stimulant, a "glucostatic" theory now under investigation

ARTIFICIAL INSEMINATION

Both here and abroad, more and more consideration is being given to the medicolegal aspects of artificial insemination A study has been under way for some time by a committee appointed by the Swedish government, which in collaboration with similar committees created in Denmark and Norway is undertaking to prepare uniform Scandinavian legislation to clarify some of the legal uncertainties that arise out of this procedure Legislation having a similar objective has been considered by a number of states in this country in recent years, but no law has as yet been enacted dealing with the subject In this issue of THE JOURNAL (page 250) is published an article prepared by the Bureau of Legal Medicine and Legislation which points up some of the significant legal issues that present themselves when a child results from artificial insemination The article contains references to pertinent court decisions, medicolegal discussions, and types of legislation that have been proposed in the United States This is a subject the importance of which should be realized by all physicians who undertake artificially to inseminate a woman and is one that merits further study

THE LOS ANGELES SESSION OF THE AMERICAN MEDICAL ASSOCIATION

The fifth annual Clinical Session of the American Medical Association, with its scientific program, exhibits, and House of Delegates meetings, will be held in Los Angeles, Dec 4-7, 1951 The Clinical Sessions, scheduled midway between the Annual Sessions of the Association, have increased in popularity since their inception four years ago One reason for this popularity is the growing realization among busy clinicians that it is impossible to keep abreast of current developments in medicine without frequent short refresher courses, such as those provided by the clinical lectures, discussions, demonstrations, and exhibits of these sessions Another is the increasing interest in, and awareness of, the activity of the governing body of the American Medical Association, the House of Delegates, which attracts a larger audience of visitors each year This year a third reason can be added the not unpleasant prospect of a brief winter holiday in sunny California

As in past years the scientific program of the Clinical Session will emphasize the practical application of recent advances in medicine to the everyday problems of general practice Outstanding clinical teachers will present lectures and demonstrations on such topics as problems in obstetrical delivery, the differential diagnosis of poliomyelitis and Coxsackie virus disease, urologic diagnosis, correctable types of heart disease, dermatologic therapy, psychotherapy, office anesthesia, acute abdominal conditions, head injuries, and allergy

In the Scientific Exhibit, housed in the Shrine Auditorium, a wealth of information and experience in many branches of medicine will be presented in condensed, graphic form Several special exhibits on fractures, obesity, and noise, that proved popular at the Atlantic City Session, will be shown again in Los Angeles The numerous technical exhibits, also located in the Shrine Auditorium, will display a variety of new drugs, books, instruments, and other equipment of use to clinicians Representatives of the manufacturers will be available to answer questions or discuss the application of these products to the individual physician's problems Continuous motion picture and television demonstrations of numerous diagnostic and therapeutic procedures will be provided

One of the high lights of the Clinical Session will be the presentation by the House of Delegates of an award to the General Practitioner of the Year The recipient of this honor is selected by a vote from among a list of candidates submitted by the county and state medical societies to the Board of Trustees

Those who have attended these meetings in previous years are aware of the advantages of early registration All others are urged to make their hotel reservations as soon as possible Application forms for hotel reservations and for advance registration may be found in this (adv pp 14-15) and subsequent issues of THE JOURNAL

CORTISONE AND TUBERCULOSIS

In 1949 Lurie [1] and his associates of the Henry Phipps Institute, Philadelphia, reported that in rabbits tuberculosis is accompanied by hypertrophy of the adrenal cortex and that the degree of hypertrophy is much greater in genetically resistant strains of rabbits than in susceptible strains This suggested a positive role of adrenal hormones in tuberculosis resistance Tests were therefore made [2] of the possible prophylactic or therapeutic action of cortisone on air-borne tuberculosis

Twenty littermates of a genetically uniform and highly susceptible strain of rabbits were divided into two groups of 10 each One group received intramuscularly 2 mg of cortisone acetate per kilogram of body weight on alternate days The second group received the same volume of suspending fluid without cortisone Three days after the start of cortisone treatment, when the circulating lymphocytes had been markedly depressed and the fasting blood sugar increased in the cortisone-treated animals, both groups were simultaneously exposed to inhalation of a known number of viable, virulent, human-type tubercle bacilli (H37Rv), by the Lurie [3] technic, for the study of air-borne infections

All animals were maintained in a room at a constant temperature and the cortisone injections continued till the end of the experiment Thirty-four to 38 days later, the animals were killed and the number and size of the pulmonary tubercles determined On an average, four times as many tubercles were found in the lungs of the cortisone-treated animals as in the controls For example, 275 tubercles developed in the lungs of one treated rabbit and only 72 in the lungs of its control

The simplest explanation of this difference is that cortisone increases the phagocytic activity of alveolar macrophages, so that more of the inhaled bacilli are retained than in the control This belief was confirmed by a quantitative study of splenic and hepatic phagocytosis of carbon particles following intravenous injection of india ink A similar increase in pulmonary retention of tubercle bacilli had been previously noted in genetically resistant rabbits [4] The increased phagocytosis, however, does not mean an increased destruction of the bacilli

Josiah J Moore, Treasurer

AUDITOR'S REPORT

March 28, 1951

To the Board of Trustees,
American Medical Association,
Chicago, Illinois

We have examined the balance sheet of American Medical Association as of December 31, 1950 and the related statement of income for the year then ended Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances

In our opinion, the accompanying balance sheet and statement of income present fairly the financial position of American Medical Association at December 31, 1950 and the results of its operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent in all material respects with that of the preceding year

CIVIL DEFENSE

National Civil Defense Medical Conference

On Nov 9 and 10, 1951, the American Medical Association will sponsor, with the American Hospital Association and the Association of State and Territorial Health Officers, a National Civil Defense Medical Conference One of the primary purposes of the meeting, which will be held in Chicago is to bring together the state health officer, the top state hospital administrator and the most active member, *in terms of civil defense, from* each of the state medical associations The Federal Civil Defense Administration is also actively assisting in preparing the program They have assured the American Medical Association that by the date of the meeting it will be possible to present several new concrete recommendations, rather than discuss future plans

Federal Civil Defense Administration Uses Film "They Also Serve"

The film They Also Serve, which the Council on National Emergency Medical Service of the American Medical Association assisted in preparing, was used in a television series on civil defense, which has appeared for the past several Sundays over the National Broadcasting System Mr Howard R H Johnson, chief, Motion Picture Branch, Federal Civil Defense Administration, in a letter dated July 25, 1951, said in part We used several sequences from your fine film to illustrate the importance of medical services in the event of enemy attack These film sequences made a real contribution to the program

Recent Publications Regarding Civil Defense

The Council on National Emergency Medical Service of the American Medical Association has compiled the following list of articles and publications regarding the medical aspects of civil defense

Medical Aspects of Nuclear Energy
Army Navy Air Force Register July 21, 1951

Radiation Hazards

FEDERAL MEDICAL LEGISLATION

Armed Forces Reserves

Senator Russell of Georgia introduced S 1991 relating to the reserve components of the Armed Forces This bill is identical with H R 4860 (previously reported) and would rewrite the laws pertaining to the reserve organizations of the military services It would establish the Ready Reserve, Stand by Reserve and Retired Reserve

Problems of the Aging

Representative Rhodes of Pennsylvania introduced H R 393 It would authorize a Select Committee on Problems of the Aging to be composed of seven members of the House of Representatives, all appointed by the Speaker The study committee would investigate the status of the older age group with respect to the manpower potential and the basic problems of this group in the fields of employment, health, education, and community services, and the federal government s responsibilities It is identical with H Res 238 (previously reported)

The summary of federal legislation was prepared by the Washington Office of the American Medical Association

MEDICAL NEWS
